(57) **ABSTRACT**

The disclosure provides a new and distinct hybrid melon variety NUN 76207 MEM as well as seeds and plants and fruits thereof. NUN 76207 MEM is a Cantaloupe non-sutured melon variety of the Harper subtype with long shelf-life, oval shape, moderate yellow green rind color and dark orange flesh comprising resistance to *Podosphaera xanthii* Race 1, Race 2, Race 5, *Fusarium oxysporum melonis* Race 1, Muskmelon Necrotic Spot Virus (MNSV), and *Aphis gossypii*.

MELON VARIETY NUN 76207 MEM**CROSS-REFERENCE TO RELATED APPLICATION**

This application claims priority to U.S. Provisional Patent Application No. 62/771,424 filed on Nov. 26, 2018, which is hereby incorporated by reference in its entirety.

FIELD OF THE DISCLOSURE

The disclosure relates to the field of plant breeding and, more specifically, to melon variety NUN 76207 MEM. The disclosure further relates to vegetative reproductions of melon variety NUN 76207 MEM, methods for tissue culture of melon variety NUN 76207 MEM and regenerating a plant from such a tissue culture and to phenotypic variants of melon variety NUN 76207 MEM. The disclosure also relates to progeny of melon variety NUN 76207 MEM and the hybrid varieties obtained by crossing melon variety NUN 76207 MEM as a parent line with plants of other varieties or parent lines.

BACKGROUND OF THE DISCLOSURE

The goal of plant breeding is to combine various desirable traits in a single variety. Such desirable traits may include greater yield, resistance to diseases, insects or other pests, tolerance to heat and drought, better agronomic quality, higher nutritional value, enhanced growth rate, and improved fruit properties.

Breeding techniques take advantage of a plant's method of pollination. There are two general methods of pollination: a plant self-pollinates if pollen from one flower is transferred to the same or another flower of the same genotype. A plant cross-pollinates if pollen comes to it from a flower of a different genotype. Plants that have been self-pollinated and selected for (uniform) type over many generations become homozygous at almost all gene loci and produce a uniform population of true breeding progeny of homozygous plants. A cross between two such homozygous plants of different lines produces a uniform population of hybrid plants that are heterozygous for many gene loci. The extent of heterozygosity in the hybrid is a function of the genetic distance between the parents. Conversely, a cross of two plants each heterozygous at a number of loci produces a segregating population of hybrid plants that differ genetically and are not uniform. The resulting non-uniformity makes performance unpredictable.

The development of uniform varieties requires the development of homozygous inbred plants, the crossing of these inbred plants to make hybrids, and the evaluation of the hybrids resulting from the crosses. Pedigree breeding and recurrent selection are examples of breeding methods that have been used to develop inbred plants from breeding populations. Those breeding methods combine the genetic backgrounds from two or more plants or various other broad-based sources into breeding pools from which new lines are developed by selfing and selection of desired phenotypes. The new plants are evaluated to determine which have commercial potential.

One crop species which has been subject to such breeding programs and is of particular value is the melon. It belongs to the Cucurbitacea family and has originated in Asia. The plant is a large and sprawling annual, grown for its fruit. The fruit of most species of *Cucumis melo* is often colored attractively, commonly yellow, orange or red. Melon can

contain black seeds, which are considered undesirable for some uses. Common types include Persian, Honey Dew, Casaba, Crenshaw, Common/Summer and subtypes such as the popular Galia, Canary, Western Shipper or the new Crispy types. Melon is typically consumed fresh as desserts, snacks, or in salads.

One of the leading consumers of melon is the United States with California as the major producer. Melon is available year-round but supply peaks in August and ends in November.

While breeding efforts to date have provided a number of useful melon varieties with beneficial traits, there remains a great need in the art for new varieties with further improved traits. Such plants would benefit farmers and consumers alike by improving crop yields and/or quality. Breeding objectives include varying the color, size, texture and flavor of the fruit, absence of seeds, optimizing flesh thickness, disease or pest resistance, yield, suitability to various climatic circumstances, solid content (% dry matter), sugar content, and storage properties.

SUMMARY OF VARIOUS ASPECTS OF THE DISCLOSURE

The disclosure provides for melon variety NUN 76207 MEM, products thereof, and methods of using the same. NUN 76207 MEM is a Cantaloupe non-sutured melon variety of the Harper subtype with long shelf-life, oval shape, moderate yellow green rind color, and dark orange flesh and is suitable for growing in the open field.

In one aspect, the disclosure provides a seed of melon variety NUN 76207 MEM, wherein a representative sample of said seed has been deposited under Accession Number NCIMB 43532. The disclosure also provides for a plurality of seeds of melon variety NUN 76207 MEM. The melon seed of variety NUN 76207 MEM may be provided as an essentially homogeneous population of melon seed. The population of seed of melon variety NUN 76207 MEM may be particularly defined as essentially free from other seed. The seed population may be grown into plants to provide an essentially homogeneous population of melon plants as described herein.

The disclosure also provides a plant grown from a seed of melon variety NUN 76207 MEM and a plant part thereof.

The disclosure furthermore provides a melon fruit produced on a plant grown from a seed of melon variety NUN 76207 MEM.

In another aspect, the disclosure provides a seed growing or grown on a plant of variety NUN 76207 MEM (i.e., produced after pollination of the flower of melon variety NUN 76207 MEM).

In other aspects, the disclosure provides for a plant part obtained from melon variety NUN 76207 MEM, wherein said plant part is: a fruit, a harvested fruit, a part of a fruit, a leaf, a part of a leaf, pollen, an ovule, a cell, a petiole, a shoot or a part thereof, a stem or a part thereof, a root or a part thereof, a root tip, a cutting, a seed, a part of a seed, seed coat or another maternal tissue which is part of a seed grown on said variety, a hypocotyl, cotyledon, a scion, a stock, a rootstock, a pistil, an anther, or a flower or a part thereof. Fruits are particularly important plant parts. Such plant parts may be suitable for sexual reproduction, vegetative reproduction, or a tissue culture. In another aspect, the plant part obtained from melon variety NUN 76207 MEM is a cell, optionally a cell in a cell or tissue culture. That cell may be grown into a plant of variety NUN 76207 MEM.

In another aspect, the disclosure provides for an inbred variety of NUN 76207 MEM.

In another aspect, the disclosure provides for a hybrid melon variety NUN 76207 MEM. The disclosure also provides for a progeny of melon variety NUN 76207 MEM. In another aspect, the disclosure provides a plant or a progeny retaining all or all but one, two or three of the “distinguishing characteristics” or all or all but one, two or three of the “morphological and physiological characteristics” of melon variety NUN 76207 MEM, and methods for producing that plant or progeny.

In one aspect, the disclosure provides a plant or a progeny having all the physiological and morphological characteristics of variety NUN 76207 MEM when grown under the same environmental conditions. In another aspect, the plant or progeny has all or all but one, two or three of the physiological and morphological characteristics of melon variety NUN 76207 MEM when measured under the same environmental conditions and e.g., evaluated at significance levels of 1%, 5% or 10% significance (which can also be expressed as a p-value) for quantitative characteristics, wherein a representative sample of seed of variety NUN 76207 MEM has been deposited under Accession Number NCIMB 43532. In another aspect, the plant or progeny has all or all but one, two or three of the physiological and morphological characteristics as listed in Tables 1-3 for variety NUN 76207 MEM when measured under the same environmental conditions and e.g., evaluated at significance levels of 1%, 5% or 10% (which can also be expressed as a p-value) for quantitative characteristics.

In another aspect, the plant of variety NUN 76207 MEM, or part thereof, or progeny thereof has 21, 22, or more or all of the following distinguishing characteristics as shown in Table 4 when compared to the Reference Variety: 1) shorter number of days to harvest; 2) weak development of lobes of mature leaf; 3) darker greyish olive green mature leaf color; 4) darker intensity of green color of mature leaf; 5) shorter mature leaf length; 6) thinner mature leaf width; 7) shorter petiole length of mature leaf; 8) longer peduncle length of young fruit; 9) broad elliptic shape of mature fruit in longitudinal section; 10) larger blossom scar diameter; 11) medium sized pistil scar; 12) thinner cork layer; 13) shallow rind net interstices; 14) larger fruit medial; 15) moderate yellow green color of rind (primary) at edible maturity; 16) darker pale yellow color of rind (net) at edible maturity; 17) greenish yellow ground color of skin; 18) pale moderate orange color of flesh near cavity at edible maturity; 19) darker moderate orange color of flesh near center at edible maturity; 20) lighter moderate orange color of flesh near rind at edible maturity; 21) higher penetrometer resistance reading; and 22) larger seed cavity width, when grown under the same environmental conditions.

In another aspect, the plant of melon variety NUN 76207 MEM, or part thereof, or progeny thereof comprises resistance to *Podosphaera xanthii* Race 1, Race 2, Race 5, *Fusarium oxysporum melonis* Race 1, Muskmelon Necrotic Spot Virus (MNSV), and *Aphis gossypii*, measured according to TG104/5 and as shown in Table 3.

In another aspect, the disclosure provides a cell culture of melon variety NUN 76207 MEM, and a plant regenerated from melon variety NUN 76207 MEM, wherein said plant has all the characteristics of melon variety NUN 76207 MEM, when grown under the same environmental conditions, as well as methods for culturing and regenerating melon variety NUN 76207 MEM. Alternatively, a regenerated plant may have one characteristic that is different from melon variety NUN 76207 MEM.

The disclosure also provides a vegetatively propagated plant of variety NUN 76207 MEM having all or all but one, two or three of the morphological and physiological characteristics of melon variety NUN 76207 MEM, when grown under the same environmental conditions as well as methods for vegetatively propagating melon variety NUN 76207 MEM.

In another aspect, the disclosure provides a method of producing a melon plant comprising crossing melon variety NUN 76207 MEM with itself or with another melon variety and selecting a progeny melon plant from said crossing.

The disclosure also provides a method of producing a melon plant derived from melon variety NUN 76207 MEM.

In further aspect, the disclosure provides a method of producing a hybrid melon seed comprising crossing a first parent melon plant with a second parent melon plant and harvesting the resultant hybrid melon seed, wherein said first parent melon plant or second parent melon plant is melon variety NUN 76207 MEM. Also provided is a hybrid melon seed produced from crossing a first parent melon plant and second parent melon plant and harvesting the resultant hybrid melon seed, wherein said first parent melon plant or second parent melon plant is melon variety NUN 76207 MEM. Moreover, the hybrid melon plant grown from the hybrid melon seed is provided.

In another aspect, the disclosure provides a method of introducing a single locus conversion into a plant of variety NUN 76207 MEM, wherein a representative sample of seed of said melon variety has been deposited under Accession Number NCIMB 43532, wherein the plant otherwise retains all of the physiological and morphological characteristics of melon variety NUN 76207 MEM and further comprises the single locus conversion.

In yet another aspect, the disclosure provides a method for introducing a desired trait into melon variety NUN 76207 MEM, said method comprises transforming the plant of variety NUN 76207 MEM with a transgene that confers the desired trait, wherein the transformed plant otherwise has all of the physiological and morphological characteristics of melon variety NUN 76207 MEM and contains the desired trait.

The disclosure also provides a method of producing a modified melon plant with a desired trait, wherein the method comprises mutating a melon plant or plant part of melon variety NUN 76207 MEM, wherein a representative sample of seed of said melon variety has been deposited under Accession Number NCIMB 43532, and wherein the mutated plant otherwise retains all of the physiological and morphological characteristics of melon variety NUN 76207 MEM and contains the desired trait.

In one aspect, the single locus conversion or desired trait is yield, storage properties, color, flavor, size, firmness, enhanced nutritional quality, post-harvest quality, male sterility, herbicide tolerance, insect resistance, pest resistance, disease resistance, environmental stress tolerance, modified carbohydrate metabolism, modified metabolism, or ripening.

In another aspect, the disclosure provides a container comprising the plant, plant part, or seed of melon variety NUN 76207 MEM.

Also provided is a food, a feed, or a processed produced comprising a plant part of melon variety NUN 76207 MEM, wherein the plant part is a fruit or part thereof.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 shows the mature leaf of melon variety NUN 76207 MEM.

5

FIG. 2 shows the mature leaf of the Reference Variety.

FIG. 3 shows the blossom end scar of melon variety NUN 76207 MEM.

FIG. 4 shows the mature fruit of melon variety NUN 76207 MEM and the Reference Variety.

FIG. 5 shows the cross-section of mature fruit of melon variety NUN 76207 MEM and the Reference Variety.

FIG. 6 shows the shape of mature fruit (cross-section) of melon variety NUN 76207 MEM (oval and broad elliptic) and the Reference Variety (oval and medium to broad elliptic).

DEFINITIONS

“Melon” or “muskmelon” refers herein to plants of the species *Cucumis melo*, and fruits thereof. The most commonly eaten part of a melon is the fruit or berry, also known as pepo. The fruit comprises exocarp, mesocarp, endocarp or seed cavity, hypanthium tissue and optionally seed. Exocarp, mesocarp, endocarp or seed cavity, hypanthium tissue, and seed coat of the seed are maternal tissues, so they are genetically identical to the plant on which they grow.

“Cultivated melon” refers to plants of *Cucumis melo* (e.g., varieties, breeding lines or cultivars of the species *C. melo*), cultivated by humans and having good agronomic characteristics.

“Cantaloupe melon” refers to orange-fleshed melons.

The terms “melon plant designated NUN 76207 MEM,” “NUN 76207 MEM,” “NUN 76207,” “NUN 76207 F1,” “76207 MEM,” or “melon 76207,” are used interchangeably herein and refer to a melon plant of variety NUN 76207 MEM, representative seed of which has been deposited under Accession Number NCIMB 43532.

“Plant” includes the whole plant or any part or derivatives thereof, preferably having the same genetic makeup as the plant from which it is obtained.

“Plant part” includes any part of a plant, such as a plant organ (e.g., harvested or non-harvested fruits), a plant cell, a plant protoplast, a plant cell tissue culture or a tissue culture from which a whole plant can be regenerated, a plant cell that is intact in a plant, a clone, a micropropagation, plant callus, a plant cell clump, a plant transplant, a vegetative propagation, a seedling, a fruit, a harvested fruit, a part of a fruit, a leaf, a part of a leaf, pollen, an ovule, an embryo, a petiole, a shoot or a part thereof, a stem or a part thereof, a root or a part thereof, a root tip, a cutting, a seed, a part of a seed, a hypocotyl, a cotyledon, a scion, a graft, a stock, a rootstock, a pistil, an anther, or a flower or part thereof. Seed can be mature or immature. Pollen or ovules may be viable or non-viable. Also, any developmental stage is included, such as seedlings, cuttings prior or after rooting, mature plants or leaves. Alternatively, a plant part may also include a plant seed which comprises maternal tissues of melon variety NUN 76207 MEM and an embryo having one or two sets of chromosomes derived from the parent plant, e.g., from melon variety NUN 76207 MEM. Such an embryo comprises two sets of chromosomes derived from melon variety NUN 76207 MEM, if it is produced from self-pollination of said variety, while an embryo derived from cross-fertilization of melon variety NUN 76207 MEM, will comprise only one set of chromosomes from said variety.

A “seed of NUN 76207 MEM” refers to a melon seed which can be grown into a plant of variety NUN 76207 MEM, wherein a representative sample of viable seed has been deposited under Accession Number NCIMB 43532. A seed can be in any stage of maturity, for example, a mature,

6

viable seed, or an immature, non-viable seed. A seed comprises an embryo and maternal tissues.

An “embryo of NUN 76207 MEM” refers to a “F1 hybrid embryo” as present in a seed of melon variety NUN 76207 MEM, a representative sample of said seed has been deposited under Accession Number NCIMB 43532.

A “seed grown on NUN 76207 MEM” refers to a seed grown on a mature plant of variety NUN 76207 MEM or inside a fruit of melon variety NUN 76207 MEM. The “seed grown on NUN 76207 MEM” contains tissues and DNA of the maternal parent, melon variety NUN 76207 MEM. The “seed grown on NUN 76207 MEM” contains an F1 embryo. When said seed is planted, it grows into a first-generation progeny plant of variety NUN 76207 MEM.

A “fruit of NUN 76207 MEM” refers to a fruit containing maternal tissues of melon variety NUN 76207 MEM, as deposited under Accession Number NCIMB 43532. In one aspect, the fruit contains seed grown on melon variety NUN 76207 MEM. In another aspect, the fruit does not contain seed, so the fruit is parthenocarpic. The skilled person is familiar with methods for inducing parthenocarpy. Those methods comprise chemically or genetically inducing parthenocarpy. Compounds suitable for chemically inducing parthenocarpy comprise auxins, gibberellins and cytokinins. Methods for genetically inducing parthenocarpy comprise the methods described in US 2017/0335339, US 2017/0240913, and US 2017/0071145. A fruit can be in any stage of maturity, for example, a mature fruit in the yellow stage comprising viable seed, or an immature fruit in the edible green stage comprising non-viable seed.

An “essentially homogeneous population of melon seed” is a population of seeds where at least 97%, 98%, 99% or more of the total population of seed are seeds of melon variety NUN 76207 MEM.

An “essentially homogeneous population of melon plants” is a population of plants where at least 97%, 98%, 99% or more of the total population of plants are plants of melon variety NUN 76207 MEM.

The phrase “essentially free from other seed” refers to a population of seed where less than 3%, 2%, 1% or less of the total population of seed is seed that is not a melon seed or, in another aspect, less than 3%, 2%, 1% or less of the total population of seed is seed that is not seed of melon variety NUN 76207 MEM.

“Rootstock” or “stock” refers to the plant selected for its root system, in particular for the resistance of the roots to diseases or stress (e.g., heat, cold, salinity etc.). Generally, the quality of the fruit of the plant providing the rootstock is less important.

“Scion” refers to a part of the plant attached to the rootstock. This plant is selected for its stems, leaves, flowers, or fruits. The scion contains the desired genes to be duplicated in future production by the stock/scion plant and may produce the desired melon fruit.

“Stock/scion” or “grafted plant” refers to a melon plant comprising a rootstock from one plant grafted to a scion from another plant.

“Grafting” refers to attaching tissue from one plant to another plant so that the vascular tissues of the two tissues join together. Grafting may be done using methods known in the art like: 1) Tongue Approach/Approach Graft; 2) Hole Insertion/Terminal/Top Insertion Graft; 3) One Cotyledon/Slant/Splice/Tube Graft; and 4) Cleft/Side Insertion Graft.

“Flavor” refers to the sensory impression of a food or other substance, especially a melon fruit or fruit part (fruit flesh) and is determined mainly by the chemical senses of taste and smell. Flavor is influenced by texture properties

and by volatile and/or non-volatile chemical components (organic acids, lipids, carbohydrates, salts etc.).

“Aroma” refers to smell (or odor) characteristics of melon fruits or fruit parts (fruit flesh).

“Harvest maturity” is referred to as the stage at which a melon fruit is ripe or ready for harvest or the optimal time to harvest the fruit for the market, for processing or for consumption. In one aspect, harvest maturity is the stage which allows proper completion of the normal ripening.

“Harvested plant material” refers herein to plant parts (e.g., fruits detached from the whole plant), which have been collected for further storage and/or further use.

“Yield” means the total weight of all melon fruits harvested per hectare of a particular line or variety. It is understood that “yield” expressed as weight of all melon fruits harvested per hectare can be obtained by multiplying the number of plants per hectare times the “yield per plant”.

“Marketable yield” means the total weight of all marketable melon fruits, especially fruit which is not cracked, damaged or diseased, harvested per hectare of a particular line or variety. A “marketable fruit” is a fruit that has commercial value.

“Refractometer % of soluble solids” refers to the percentage of soluble solids in fruit juice. It is also expressed as °Brix and indicates sweetness. The majority of soluble solids in melon are mainly sugars present in the fruits of melon hence, the correlation with sweetness. Brix can be measured using a Brix meter (also known as Refractometer).

“Netted” skin or rind refers to the presence of reticulate markings called “netting” on the skin. “Non-netted” or “absence of netting” refers to the fruits lacking such netting.

“Ribbed” refers to grooves and raised parts, running approximately straight and parallel form from (near) blossom end to (near) abscission end that are called “ribs.” “Non-ribbed” or “absence of ribbing” refers to the fruits lacking such ribs.

“Cavity” or “seed cavity” refers to the center of the fruit containing the maternal tissues and seeds.

“USDA descriptors” are the plant variety descriptors described for melon in the “Objective description of Variety—Muskmelon/Cantaloupe (*Cucumis melo* L.),” as published by the US Department of Agriculture, Agricultural Marketing Service, Plant Variety Protection Office, Beltsville, Md. 20705 and which can be downloaded from the world-wide web at ams.usda.gov/under_services/plant-variety-protection/pvpo-c-forms under muskmelon. “Non-USDA descriptors” are other descriptors suitable for describing melon.

“UPOV descriptors” are the plant variety descriptors described for melon in the “Guidelines for the Conduct of Tests for Distinctness, Uniformity and Stability, TG/104/5 (Geneva 2006, as last updated in 2014 Apr. 9), as published by UPOV (International Union for the Protection of New Varieties and Plants) and which can be downloaded from the world-wide web at upov.int/edocs/tgdocs/en/tg104.pdf and is herein incorporated by reference in its entirety. Likewise, “UPOV methods” to determine specific parameters for the characterization of melon are described at upov.int.

“Calibration book *Cucumis melo* L.” refers to the calibration book for melon which provides guidance for describing a melon variety, as published by Naktuinbow (December 2020, version 1) and based on the UPOV Guideline TG/104/5 and CPVO (Community Plant Variety Office) Protocol CPVO-TP/104/2.

“RHS” or “RHS color chart” refers to the color chart of the Royal Horticultural Society (UK), which publishes a botanical color chart quantitatively identifying colors by a

defined numbering system. The chart may be purchased from Royal Horticulture Society Enterprise Ltd. RHS Garden; Wisley, Woking; Surrey GU236QB, UK, e.g., the RHS color chart 2007.

“Reference Variety for NUN 76207 MEM” refers herein to variety Fiji F1, a variety from Harris Moran, which has been planted in a trial together with melon variety NUN 76207 MEM. The characteristics of melon variety NUN 76207 MEM were compared to the characteristics of the Reference Variety as shown in Tables 1 and 2. The disease resistances of melon variety NUN 76207 MEM and the Reference Variety are shown in Table 3. The distinguishing characteristics between melon variety NUN 76207 MEM and the Reference Variety are shown in Table 4.

A plant having “all the physiological and morphological characteristics” of a referred-to-plant means a plant showing the physiological and morphological characteristics of the referred-to-plant when grown under the same environmental conditions, preferably in the same experiment; the referred-to-plant can be a plant from which it was derived, e.g., the progeny plant, the progenitor plant, the parent, the recurrent parent, the plant used for tissue- or cell culture, etc. A physiological or morphological characteristic can be a numerical characteristic or a non-numerical characteristic. In one aspect, a plant has “all but one, two or three of the physiological and morphological characteristics” of a referred-to-plant, or “all the physiological and morphological characteristics” of Tables 1-3 or “all or all but one, two or three of the physiological and morphological characteristics” of Tables 1-3.

The physiological and/or morphological characteristics mentioned above are commonly evaluated at significance levels of 1%, 5% or 10% if they are numerical (quantitative), or for having an identical degree (or type) if not numerical (not quantitative), if measured under the same environmental conditions. For example, a progeny plant or a Single Locus Converted plant or a mutated plant of variety NUN 76207 MEM, may have one or more (or all) of the essential physiological and/or morphological characteristics of said variety listed in Tables 1-3, as determined at the 5% significance level (i.e., $p < 0.05$), when grown under the same environmental conditions.

“Distinguishing characteristics” or “distinguishing morphological and/or physiological characteristics” refer herein to the characteristics which distinguish the new variety from other melon varieties, such as the Reference Variety (i.e., are different), when grown under the same environmental conditions. The distinguishing characteristics between melon variety NUN 76207 MEM and its Reference Variety are described herein and can be seen in Table 4. When comparing melon variety NUN 76207 MEM to other varieties, the distinguishing characteristics may be different. In one aspect, the distinguishing characteristics may therefore include one, two, three or more (or all) of the characteristics listed in Tables 1-3. All numerical distinguishing characteristics are statistically significantly different at $p < 0.05$ between melon variety NUN 76207 MEM and the other variety (e.g., the Reference Variety).

Melon variety NUN 76207 MEM has the following distinguishing characteristics when compared to the Reference Variety as shown in Table 4: 1) shorter number of days to harvest; 2) weak development of lobes of mature leaf; 3) darker greyish olive green mature leaf color; 4) darker intensity of green color of mature leaf; 5) shorter mature leaf length; 6) thinner mature leaf width; 7) shorter petiole length of mature leaf; 8) longer peduncle length of young fruit; 9) broad elliptic shape of mature fruit in longitudinal section;

10) larger blossom scar diameter; 11) medium sized pistil scar; 12) thinner cork layer; 13) shallow rind net interstices; 14) larger fruit medial; 15) moderate yellow green color of rind (primary) at edible maturity; 16) darker pale yellow color of rind (net) at edible maturity; 17) greenish yellow ground color of skin; 18) pale moderate orange color of flesh near cavity at edible maturity; 19) darker moderate orange color of flesh near center at edible maturity; 20) lighter moderate orange color of flesh near rind at edible maturity; 21) higher penetrometer resistance reading; and 22) larger seed cavity width, when grown under the same environmental conditions.

Thus, a melon plant “comprising the distinguishing characteristics of melon variety NUN 76207 MEM” (such as a progeny plant) refers herein to a plant which does not differ significantly from said variety in the distinguishing characteristics above. Therefore, in one aspect, the disclosure provides a plant which does not differ significantly from melon variety NUN 76207 MEM in the distinguishing characteristics above.

Similarity and differences between two different plant lines or varieties can be determined by comparing the number of morphological and/or physiological characteristics that are the same (i.e., statistically not significantly different) or that are different (i.e., statistically significantly different) between the two plant lines or varieties using plants grown under the same environmental conditions. A numerical characteristic is considered to be “the same” when the value for a numeric characteristic is not significantly different at the 1% ($p < 0.01$) or 5% ($p < 0.05$) significance level, using one way analysis of variance (ANOVA) or T-test Paired Sample Means, standard methods known to the skilled person. Non-numerical or “degree” or “type” characteristic is considered “the same” when the values have the same “degree” or “type” when scored using USDA and/or UPOV descriptors, if the plants are grown under the same environmental conditions.

The term “traditional breeding techniques” encompasses herein crossing, selfing, selection, doubled haploid production, embryo rescue, protoplast fusion, marker assisted selection, mutation breeding etc. as known to the breeder (i.e., methods other than genetic modification/transformation/transgenic methods), by which, for example, a genetically heritable trait can be transferred from one melon line or variety to another.

“Variety” or “cultivar” means a plant grouping within a single botanical taxon of the lowest rank.

A “plant line” is, for example, a breeding line which can be used to develop one or more varieties. A breeding line is typically highly homozygous.

“Harvested seeds” refer to seeds harvested from a line or variety, e.g., produced after self-fertilization or cross-fertilization and collected.

“Hybrid variety” or “F1 hybrid” refers to the seeds harvested from crossing two inbred (nearly homozygous) parental lines. For example, the female parent is pollinated with pollen of the male parent to produce hybrid (F1) seeds on the female parent.

“Locus” (plural loci) refers to the specific location, place or site of a DNA sequence on a chromosome, where, for example, a gene or genetic marker is found. A locus may confer a specific trait.

“Allele” refers to one or more alternative forms of a gene locus. All of these loci relate to one trait. Sometimes, different alleles can result in different observable phenotypic traits, such as different pigmentation. However, many variations at the genetic level result in little or no observable

variation. If a multicellular organism has two sets of chromosomes, i.e., diploid, these chromosomes are referred to as homologous chromosomes, i.e., diploid. Diploid organisms have one copy of each gene (and therefore one allele) on each chromosome. If both alleles are the same, they are homozygotes. If the alleles are different, they are heterozygotes.

“Genotype” refers to the genetic composition of a cell or organism.

“Phenotype” refers to the detectable characteristic of a plant, cell, or organism, which characteristics are the manifestation of gene expression.

“Haploid” refers to a cell or organism having one set of the two sets of chromosomes in a diploid.

“Diploid” refers to a cell or organism having two sets of chromosomes.

“Triploid” refers to a cell or organism having three sets of chromosomes.

“Tetraploid” refers to a cell or organism having four sets of chromosomes.

“Polyploid” refers to a cell or organism having three or more complete sets of chromosomes.

“Tissue culture” or “cell culture” refers to a composition comprising isolated cells of the same or a different type or a collection of such cells organized into parts of a plant. Tissue culture of melon and regeneration of plants therefrom is well known and widely published (see, e.g., Ren et al., *In Vitro Cell. Dev. Biol. Plant* (2013) 49:223-229; Colijn-Hooymans (1994), *Plant Cell, Tissue and Organ Culture* 39: 211-217). Similarly, methods of preparing cell cultures are known in the art.

“Regeneration” refers to the development of a plant from cell culture or tissue culture or vegetative propagation.

“Vegetative propagation,” “vegetative reproduction,” or “clonal propagation” are used interchangeably herein and mean a method of taking a plant part and inducing or allowing that plant part to form at least roots, and also refer to the plant or plantlet obtained by that method. Optionally, the vegetative propagation is grown into a mature plant. The skilled person is aware of what plant parts are suitable for use in the method.

“Crossing” refers to the mating of two parent plants. The term encompasses “cross-pollination” and “selfing”.

“Selfing” refers to self-pollination of a plant, i.e., the transfer of pollen from the anther to the stigma of the same plant.

“Cross-pollination” refers to the fertilization by the union of two gametes from different plants.

“Backcrossing” is a traditional breeding technique used to introduce a trait into a plant line or variety. The plant containing the trait is called the donor plant and the plant into which the trait is transferred is called the recurrent parent. An initial cross is made between the donor parent and the recurrent parent to produce a progeny plant. Progeny plants which have the trait are then crossed to the recurrent parent. After several generations of backcrossing and/or selfing the recurrent parent comprises the trait of the donor. The plant generated in this way may be referred to as a “single trait converted plant”. The technique can also be used on a parental line of a hybrid.

“Progeny” as used herein refers to a plant obtained from a plant designated NUN 76207 MEM. A progeny may be obtained by regeneration of cell culture or tissue culture or parts of a plant of said variety or selfing of a plant of said variety or by producing seeds of a plant of said variety. In further aspects, progeny may also encompass plants obtained from crossing of at least one plant of said variety

with another melon plant of the same variety or another variety or line, or with wild melon plants. A progeny may comprise a mutation or a transgene. A “first generation progeny” is the progeny directly derived from, obtained from, obtainable from or derivable from the parent plant by, e.g., traditional breeding methods (selfing and/or cross-pollinating) or regeneration (optionally combined with transformation or mutation). Thus, a plant of variety NUN 76207 MEM is the male parent, the female parent or both of a first generation progeny of melon variety NUN 76207 MEM. Progeny may have all the physiological and morphological characteristics of melon variety NUN 76207 MEM, when grown under the same environmental conditions. Using methods such as backcrossing, recurrent selection, mutation or transformation, one or more specific characteristics may be introduced into said variety, to provide or a plant comprising all but 1, 2, or 3 of the morphological and physiological characteristics of melon variety NUN 76207 MEM.

The terms “gene converted” or “conversion plant” or “single locus converted plant” in this context refer to melon plants which are developed by traditional breeding techniques, e.g., backcrossing, or via genetic engineering or through mutation breeding, wherein essentially all of the desired morphological and physiological characteristics of the parent variety or line are recovered, in addition to the one or more characteristics introduced into the parent via e.g., the backcrossing technique (optionally including reverse breeding or reverse synthesis of breeding lines). It is understood that not only the addition of a further characteristic (e.g., addition of gene conferring a further characteristic, such as a disease resistance gene), but also the replacement/modification of an existing characteristic by a different characteristic is encompassed herein (e.g., mutant allele of a gene can modify the phenotype of a characteristic).

Likewise, a “Single Locus Converted (Conversion) Plant” refers to plants developed by plant breeding techniques comprising or consisting of mutation breeding and/or by genetic transformation and/or by traditional breeding techniques, such as backcrossing, wherein essentially all of the desired morphological and physiological characteristics of a melon variety are recovered in addition to the characteristics of the single locus having been transferred into the—variety via abovementioned technique, or wherein the morphological and physiological characteristic of the variety has been replaced/modified in the variety. In case of a hybrid, the gene may be introduced, or modified, in the male or female parental line.

“Transgene” or “chimeric” gene” refers to a genetic locus comprising a DNA sequence which has been introduced into the genome of the plant by transformation. A plant comprising a transgene stably integrated into its genome is referred to as “transgenic plant.”

As used herein, the terms “resistance” and “tolerance” are used interchangeably to describe plants that show no symptoms or significantly reduced symptoms to a specified biotic pest, pathogen, abiotic influence or environmental condition compared to a susceptible plant. These terms are optionally also used to describe plants showing some symptoms but that are still able to produce marketable product with an acceptable yield.

“Average” refers herein to the arithmetic mean.

The term “mean” refers to the arithmetic mean of several measurements. The skilled person understands that the appearance of a plant depends to some extent on the growing conditions of said plant. The mean, if not indicated other-

wise within this application, refers to the arithmetic mean of measurements on at least 15 different, randomly selected plants of a variety or line.

DETAILED DESCRIPTION OF VARIOUS ASPECTS OF THE DISCLOSURE

The disclosure relates to the plant of variety NUN 76207 MEM, wherein a representative sample of seeds of said variety has been deposited under the Budapest Treaty, with Accession number NCIMB 43532. NUN 76207 MEM is a Cantaloupe non-sutured melon variety of the Harper subtype with long shelf-life, oval shape, moderate yellow green rind color and dark orange flesh and is suitable for growing in the open field.

The disclosure further relates to melon variety NUN 76207 MEM, which when compared to its Reference Variety has the following distinguishing characteristics as shown in Table 4: 1) shorter number of days to harvest; 2) weak development of lobes of mature leaf; 3) darker greyish olive green mature leaf color; 4) darker intensity of green color of mature leaf; 5) shorter mature leaf length; 6) thinner mature leaf width; 7) shorter petiole length of mature leaf; 8) longer peduncle length of young fruit; 9) broad elliptic shape of mature fruit in longitudinal section; 10) larger blossom scar diameter; 11) medium sized pistil scar; 12) thinner cork layer; 13) shallow rind net interstices; 14) larger fruit medial; 15) moderate yellow green color of rind (primary) at edible maturity; 16) darker pale yellow color of rind (net) at edible maturity; 17) greenish yellow ground color of skin; 18) pale moderate orange color of flesh near cavity at edible maturity; 19) darker moderate orange color of flesh near center at edible maturity; 20) lighter moderate orange color of flesh near rind at edible maturity; 21) higher penetrometer resistance reading; and 22) larger seed cavity width, where the characteristics are determined at the 5% significance level for plants grown under the same environmental conditions. Also encompassed are parts of that plant.

In one aspect, the plant of variety NUN 76207 MEM or progeny plant thereof, comprises all of the following morphological and/or physiological characteristics (i.e., average values for numerical characteristics, as indicated on the USDA Objective description of variety—melon (unless indicated otherwise)) as shown in Tables 1-3, where the characteristics are determined at the 5% significance level for plants grown under the same environmental conditions. A part of this plant is also provided.

In another aspect, melon variety NUN 76207 MEM, or part thereof, or progeny thereof, comprises resistance to *Podosphaera xanthii* Race 1, Race 2, Race 5, *Fusarium oxysporum melonis* Race 1, Muskmelon Necrotic Spot Virus (MNSV), and *Aphis gossypii*, measured according to UPOV standards described in TG/104/5 and shown in Table 3.

The disclosure further provides a melon plant which does not differ from the physiological and morphological characteristics of the plant of variety NUN 76207 MEM as determined at the 1%, 2%, 3%, 4% or 5% significance level when grown under the same environmental conditions. In a particular aspect, the plants are measured in the same trial (e.g., the trial is conducted as recommended by the USDA or UPOV). The disclosure also comprises a part of said plant, preferably a fruit or part thereof.

The morphological and/or physiological differences between two different individual plants described herein (e.g., between melon variety NUN 76207 MEM and a progeny of said variety) or between a plant of variety NUN 76207 MEM, or progeny of said variety, or a plant having

all, or all but 1, 2, or 3, of the physiological and morphological characteristics of melon variety NUN 76207 MEM, and another known variety can easily be established by growing said variety under the same environmental conditions (in the same field, optionally next to each other), preferably repeated in several locations which are suitable for cultivation of melons, and measuring the morphological and physiological characteristics of a representative number of plants (e.g., to calculate an average value and to determine the variation range/uniformity within the variety). For example, trials can be carried out in Acampo Calif., USA (N 38 degrees 07'261"/W 121 degrees 18' 807", USA), whereby various characteristics, for example, maturity, days from seeding to harvest, plant habit, fertility, leaf shape, leaf lobes, leaf color, fruit shape, blossom scar, shipping quality, fruit abscission, rind net interstices, rind net interlacing, rind net coarseness, rind net distribution, rind color, flesh color, aroma, flavor, refractometer % of soluble solids, seed cavity width and length, disease resistance, and insect resistance, can be measured and directly compared for species of melon.

Also, at-harvest and/or post-harvest characteristics of fruits can be compared, such as cold storage holding quality, post-harvest flesh firmness, and Brix using known methods. (Fruit) Flesh firmness can, for example, be measured using a penetrometer, e.g., by inserting a probe into the fruit flesh and determining the insertion force, or by other methods. Fruit flesh firmness can, for example, be measured using a "FT 327 Penetrometer," available from QA Supplies LLC, 1185 Pineridge Road, Norfolk, Va. 23502.

Thus, the disclosure comprises a melon plant having one, two or three physiological and/or morphological characteristics which are different from those of the plant of variety NUN 76207 MEM, and which otherwise has all the physiological and morphological characteristics of said variety, when determined (e.g., at the 5% significance level for quantitative characteristics or determined by type for non-quantitative characteristics) for plants grown under the same environmental conditions. In one aspect, the different characteristic(s) is/are a result of breeding with melon variety NUN 76207 MEM and selection of a progeny plant comprising one, two, or three characteristics which are different than in melon variety NUN 76207 MEM. In another aspect, the different characteristic is the result of a mutation (e.g., spontaneous mutation of a human induced mutation through, e.g., targeted mutagenesis or traditional mutagenesis such as chemically or radiation induced mutagenesis) or it is a result of transformation.

The disclosure also relates to a seed of melon variety NUN 76207 MEM, wherein a representative sample of said seed has been deposited under the Budapest Treaty, with Accession number NCIMB 43532.

In another aspect, a seed of hybrid variety NUN 76207 MEM is obtainable by crossing the male parent of melon variety NUN 76207 MEM with the female parent of melon variety NUN 76207 MEM and harvesting the seeds produced on the female parent. The resultant seeds of said variety can be grown to produce plants of said variety.

In one aspect, a seed or a plurality of seeds of said variety are packaged into a container of any size or type (e.g., bags, cartons, cans, etc.). The seed may be disinfected, primed and/or treated with various compounds, such as seed coatings or crop protection compounds. The seed produces a plant of variety NUN 76207 MEM.

In another aspect, the disclosure provides a plant grown from a seed of melon variety NUN 76207 MEM and plant part thereof.

The disclosure also provides a melon fruit produced on a plant grown from a seed of melon variety NUN 76207 MEM.

In another aspect, the disclosure provides for a plant part of melon variety NUN 76207 MEM, preferably a fruit or part thereof, a representative sample of seed of said melon variety has been deposited under Accession Number NCIMB 43532.

Also provided is a plant of melon variety NUN 76207 MEM, or a fruit or other plant part thereof, produced from a seed, wherein a representative sample of said seeds has been deposited under the Budapest Treaty, with Accession Number NCIMB 43532.

Also provided is a plant part obtained from variety NUN 76207 MEM, wherein said plant part is a fruit, a harvested fruit, a part of a fruit, a leaf, a part of a leaf, pollen, an ovule, a cell, a petiole, a shoot or a part thereof, a stem or a part thereof, a root or a part thereof, a root tip, a cutting, a seed, a part of a seed, seed coat or another maternal tissue which is part of a seed grown on said variety, a hypocotyl, cotyledon, a scion, a stock, a rootstock, a pistil, an anther, and a flower or a part thereof. Such plant parts may be suitable for sexual reproduction (e.g., a pollen, a flower, an ovary, an ovule, an embryo, etc.), vegetative reproduction (e.g., a cutting, a root, a stem, a cell, a protoplast, a leaf, a cotyledon, a meristem, etc.) or tissue culture (e.g., a leaf, a pollen, an embryo, a cotyledon, a hypocotyl, a cell, a root, a root tip, an anther, a flower, a seed, a stem, etc.). Fruits are particularly important plant parts. Fruits may be parthenocarpic, or seedless, or contain immature or nonviable seeds, or contain viable seeds.

In a further aspect, the plant part obtained from melon variety NUN 76207 MEM, is a cell, optionally a cell in a cell or tissue culture. That cell may be grown into a plant of variety NUN 76207 MEM. A part of melon variety NUN 76207 MEM (or of a progeny of that variety or of a plant having all physiological and/or morphological characteristics but one, two or three of melon variety NUN 76207 MEM) further encompasses any cells, tissues, organs obtainable from the seedlings or plants in any stage of maturity.

The disclosure also provides a tissue or cell culture comprising cells of melon variety NUN 76207 MEM. Such a tissue culture can, for example, be grown on plates or in liquid culture, or be frozen for long term storage. The cells of melon variety NUN 76207 MEM used to start the culture can be selected from any plant part suitable for vegetative reproduction, or in a particular aspect, can be cells of an embryo, meristem, a cotyledon, a hypocotyl, pollen, a leaf, an anther, a root, a root tip, a pistil, a petiole, a flower, a fruit, seed or a stem. In another particular aspect, the tissue culture does not contain somaclonal variation or has reduced somaclonal variation. The skilled person is familiar with methods to reduce or prevent somaclonal variation, including regular reinitiation.

In one aspect, the disclosure provides a melon plant regenerated from the tissue or cell culture of melon variety NUN 76207 MEM, wherein the regenerated plant is not significantly different from melon variety NUN 76207 MEM, in all, or all but one, two or three, of the physiological and morphological characteristics (e.g., determined at the 5% significance level when grown under the same environmental conditions). Optionally, the plant has one, two or three of the physiological and morphological characteristics that are affected by a mutation or by transformation. In another aspect, the disclosure provides a melon plant regenerated from the tissue or cell culture of melon variety NUN 76207 MEM, wherein the plant has all of the physiological

and morphological characteristics of said variety determined (e.g., at the 5% significance level) when grown under the same environmental conditions. Similarity or difference of a characteristic is determined by measuring that characteristic on a representative number of plants grown under the same environmental conditions, determining whether type/degree characteristics are the same and determining whether numerical characteristics are different at the 5% significance level.

Melon variety NUN 76207 MEM or its progeny, or a plant having all physiological and/or morphological characteristics but one, two or three which are different from those of melon variety NUN 76207 MEM, can also be reproduced using vegetative reproduction methods. Therefore, the disclosure provides for a method of producing a plant, or a plant part, of melon variety NUN 76207 MEM, comprising vegetative propagation of said variety. Vegetative propagation comprises regenerating a whole plant from a plant part of melon variety NUN 76207 MEM or from a progeny or from or a plant having all physiological and/or morphological characteristics of said variety but one, two or three different characteristics, such as a cutting, a cell culture or a tissue culture.

The disclosure also provides methods of vegetatively propagating a part of the plant of the variety NUN 76207 MEM. In certain aspects, the method comprises: (a) cultivating tissue or cells capable of being propagated from melon variety NUN 76207 MEM, to obtain proliferated shoots; and (b) rooting said proliferated shoots, to obtain rooted plantlets. Steps (a) and (b) may also be reversed, i.e., first cultivating said tissue to obtain roots and then cultivating the tissue to obtain shoots, thereby obtaining rooted plantlets. The rooted plantlets may then be further grown, to obtain plants. In one aspect, the method further comprises step (c) growing plants from said rooted plantlets. Therefore, the method also comprises regenerating a whole plant from a part of the plant of variety NUN 76207 MEM. In a particular aspect, the part of the plant to be propagated is a cutting, a cell culture or a tissue culture.

The disclosure also provides for a vegetatively propagated plant of variety NUN 76207 MEM (or from progeny of melon variety NUN 76207 MEM or from a plant having all but one, two or three physiological and/or morphological characteristics of melon variety NUN 76207 MEM), wherein the plant has all of the morphological and physiological characteristics of melon variety NUN 76207 MEM, when the characteristics are determined (e.g., at the 5% significance level) for plants grown under the same conditions. In another aspect, the propagated plant has all but one, two or three of the morphological and physiological characteristics of melon variety NUN 76207 MEM, when the characteristics are determined (e.g., at the 5% significance level) for plants grown under the same conditions. A part of said propagated plant or said propagated plant with one, two or three differences is also provided. In another aspect, the propagated plant has all or all but 1, 2, or 3 of the physiological and morphological characteristics of melon variety NUN 76207 MEM (e.g., as listed in Tables 1-3).

In another aspect, the disclosure provides a method for producing a melon plant part, such as a fruit, comprising growing a plant of variety NUN 76207 MEM until it sets at least one fruit, and collecting the fruit. Preferably, the fruit is collected at harvest maturity. In another aspect, the fruit is collected when the seed is ripe. In a particular aspect, all fruits on a truss can be harvested together. In another particular aspect, all fruit on a melon plant can be harvested

at the same time. In other aspects, the disclosure provides for a fruit of melon variety NUN 76207 MEM.

In another aspect, a plant of variety NUN 76207 MEM can be produced by seeding directly in the soil (e.g., the field) or by germinating the seeds in a controlled environment (e.g., greenhouses) and optionally then transplanting the seedlings into the field (see, e.g., <https://anrcatalog.ucanr.edu/pdf/7209.pdf>). For example, a seed is sown into a prepared seed bed in a field where the plant remains for its entire life. Alternatively, the melon seed may be planted through a black plastic mulch. The dark plastic will absorb heat from the sun, warming the soil early. It will also help to conserve moisture during the growing season, controls weeds, and makes harvesting easier and cleaner (see, e.g., <https://anrcatalog.ucanr.edu/pdf/7218.pdf>). Melon can also be grown entirely in greenhouses.

In another aspect, the plant and plant parts of melon variety NUN 76207 MEM and progeny of said variety are provided, e.g., grown from seeds, produced by sexual or vegetative reproduction, regenerated from the above-described plant parts, or regenerated from cell or tissue culture of the melon variety NUN 76207 MEM, in which the reproduced (seed propagated or vegetatively propagated) plant has all of the physiological and morphological characteristics of melon variety NUN 76207 MEM, e.g., listed in Tables 1-3. In one aspect, said progeny of melon variety NUN 76207 MEM can be modified in one, two, or three characteristics, in which the modification is a result of mutagenesis or transformation with a transgene.

In other aspects, the disclosure provides a progeny plant of variety NUN 76207 MEM, such as a progeny plant obtained by further breeding with said variety. Further breeding with melon variety NUN 76207 MEM includes selfing that variety and/or cross-pollinating said variety with another melon plant one or more times. In a particular aspect, the disclosure provides for a progeny plant that retains all of the morphological and physiological characteristics of melon variety NUN 76207 MEM, optionally all or all but one, two or three of the characteristics as listed in Tables 1-3, determined at the 5% significance level for numerical characteristics, when grown under the same environmental conditions. In another aspect, the progeny is a first generation progeny, i.e., the ovule or the pollen (or both) used in the crossing is an ovule or pollen of melon variety NUN 76207 MEM, where the pollen comes from an anther of melon variety NUN 76207 MEM and the ovule comes from an ovary of melon variety NUN 76207 MEM.

In still another aspect, the disclosure provides a method of producing a melon plant, comprising crossing a plant of variety NUN 76207 MEM with a second melon plant at least once, allowing seed to develop and optionally harvesting said progeny seed. The skilled person can select progeny from said crossing. Optionally, the progeny (grown from the progeny seed) is crossed twice, thrice, or four, five, six or seven times, and allowed to set seed. In one aspect, the first "crossing" further comprises planting seeds of a first and a second parent melon plant, often in proximity so that pollination will occur; for example, mediated by insect vectors. Alternatively, pollen can be transferred manually. Where the plant is self-pollinated, pollination may occur without the need for direct human intervention other than plant cultivation. After pollination the plant can produce seed.

The disclosure also provides a method for collecting pollen of melon variety NUN 76207 MEM, comprising collecting pollen from a plant of variety NUN 76207 MEM. Alternatively, the method comprises growing plant of variety NUN 76207 MEM until at least one flower of said

variety contains pollen and collecting the pollen. In a particular aspect, the pollen is collected when it is mature or ripe. A suitable method for collecting pollen comprises collecting anthers or the part of the anther that contains pollen, for example, by cutting the anther or the part of the anther off. Pollen can be collected in a container. Optionally, collected pollen can be used to pollinate a melon flower.

In yet another aspect, the disclosure provides a method of producing a melon plant, comprising selfing melon variety NUN 76207 MEM one or more times, and selecting a progeny melon plant from said selfing. In one aspect, the progeny plant retains all or all but one, two or three of the physiological and morphological characteristics of melon variety NUN 76207 MEM, when grown under the same environmental conditions. In a different aspect, the progeny plant comprises all of the physiological and morphological characteristic of melon variety NUN 76207 MEM of Tables 1-3.

The disclosure also provides a method for developing a melon plant in a melon breeding program, using melon variety NUN 76207 MEM, or its parts as a source of plant breeding material. Suitable plant breeding techniques are recurrent selection, backcrossing, pedigree breeding, mass selection, mutation breeding and/or genetic marker enhanced selection. In one aspect, the method comprises crossing melon variety NUN 76207 MEM, or its respective progeny, or a plant comprising all but 1, 2, or 3 or more of the morphological and physiological characteristics of melon variety NUN 76207 MEM (e.g., as listed in Tables 1-3), with a different melon plant, and wherein one or more offspring of the crossing are subject to one or more plant breeding techniques: recurrent selection, backcrossing, pedigree breeding, mass selection, mutation breeding and genetic marker enhanced selection (see, e.g., Vidaysky and Czosnek, (1998) *Phytopathology* 88(9): 910-4). For breeding methods in general, see, e.g., *Principles of Plant Genetics and Breeding*, 2007, George Acquaah, Blackwell Publishing, ISBN-13: 978-1-4051-3646-4.

In one aspect, pedigree selection is used as a breeding method for developing a melon variety. Pedigree selection is also known as the "Vilmorin System of Selection," see, e.g., Allard, John Wiley & Sons, Inc., 1999, pp. 64-67. In general, selection is first practiced among F₂ plants. In the next season, the most desirable F₃ lines are first identified, then desirable F₃ plants within each line are selected. The following season and in all subsequent generations of inbreeding, the most desirable families are identified first, then desirable lines within the selected families are chosen. A family refers to lines that were derived from plants selected from the same progeny from the preceding generation.

Thus, progeny in connection with pedigree selection are either the generation (seeds) produced from the first cross (F₁) or selfing (Si), or any further generation produced by crossing and/or selfing (F₂, F₃, etc.) and/or backcrossing (BC₁, BC₂, etc.) one or more selected plants of the F₁ and/or Si and/or BC₁ generation (or plants of any further generation, e.g., F₂) with another melon plant (and/or with a wild relative of melon). Progeny may have all the physiological and morphological characteristics of melon variety NUN 76207 MEM when grown under the same environmental conditions and/or progeny may have (be selected for having) one or more of the distinguishing characteristics of melon variety NUN 76207 MEM.

In yet another aspect, the disclosure provides for a method of producing a new melon plant comprising crossing a plant of variety NUN 76207 MEM, or a plant comprising all but one, two, or three of the morphological and physiological

characteristics of melon variety NUN 76207 MEM (as listed in Tables 1-3), or a progeny plant thereof, either as male or as female parent, with a second melon plant (or a wild relative of melon) one or more times, and/or selfing melon plant variety NUN 76207 MEM, or a progeny plant thereof, one or more time, and selecting a progeny melon plant from said crossing and/or selfing. The second melon plant may, for example, be a line or variety of the species *Cucumis melo*, or other *Cucumis* species or even other Cucurbitacea species.

In a further aspect, melon variety NUN 76207 MEM is used in crosses with other, different, melon varieties to produce first generation (F₁) melon hybrid seeds and plants with superior characteristics. In a particular aspect, the disclosure provides a melon seed and a plant produced by crossing a first parent melon plant with a second parent melon plant, wherein at least one of the first or second parent melon plant is melon variety NUN 76207 MEM. In another aspect, the melon seed and plant produced are the first filial generation (F₁) melon seed and plants produced by crossing the plant of melon variety NUN 76207 MEM with another melon plant.

The morphological and physiological characteristics of melon variety NUN 76207 MEM are provided in Tables 1-3, as collected in a trial according to USDA and/or UPOV standards. Encompassed herein is also a plant obtainable from melon variety NUN 76207 MEM (e.g., by selfing and/or crossing and/or backcrossing with said variety and/or progeny of said variety) comprising all or all but one, two or three of the physiological and morphological characteristics of melon variety NUN 76207 MEM listed in Tables 1-3 (as determined at the 5% significance level for numerical characteristics or identical for non-numerical characteristics) when grown under the same environmental conditions and/or comprising one or more (or all; or all except one, two or three) characteristics when grown under the same environmental conditions. The morphological and/or physiological characteristics may vary somewhat with variation in the environment (e.g., temperature, light intensity, day length, humidity, soil, fertilizer use, disease vectors), which is why a comparison under the same environmental conditions is preferred. Colors can best be measured using the Royal Horticultural Society (RHS) Chart.

In another aspect, the disclosure provides a method of producing a plant derived from melon variety NUN 76207 MEM, comprising crossing a plant of variety NUN 76207 MEM either as a male or female parent with a second plant or selfing melon variety NUN 76207 MEM or vegetative reproduction of melon variety NUN 76207 MEM and collecting seeds from said crossing or selfing or regenerating a whole plant from the vegetable cell or tissue culture. Also provided are seeds and/or plants obtained by this method. All plants produced using melon variety NUN 76207 MEM as a parent are within the scope of the disclosure, including plant parts derived from melon variety NUN 76207 MEM.

In further aspects, the method comprises growing a progeny plant of a subsequent generation and crossing the progeny plant of a subsequent generation with itself or a second plant and repeating the steps for additional 3-10 generations to produce a plant derived from melon variety NUN 76207 MEM. The plant derived from melon variety NUN 76207 MEM may be an inbred line and the aforementioned repeating crossing steps may be defined as comprising sufficient inbreeding to produce the inbred line. By selecting plants having one or more desirable traits of the line as well as potentially other selected traits.

The disclosure provides for methods of producing a plant which retain all the morphological and physiological characteristics of a plant described herein. The disclosure also provides for methods of producing a plant comprising all but 1, 2, 3 or more of the morphological and physiological characteristics of melon variety NUN 76207 MEM (e.g., as listed in Tables 1-3), but which are still genetically closely related to said variety. The relatedness can, for example, be determined by fingerprinting techniques (e.g., making use of isozyme markers and/or molecular markers such as Single-nucleotide polymorphism (SNP) markers, amplified fragment length polymorphism (AFLP) markers, microsatellites, minisatellites, Random Amplified Polymorphic DNA (RAPD) markers, restriction fragment length polymorphism (RFLP) markers and others). A plant is "closely related" to melon variety NUN 76207 MEM, if its DNA fingerprint is at least 80%, 90%, 95% or 98% identical to the fingerprint of melon variety NUN 76207 MEM. In a particular aspect, AFLP markers are used for DNA fingerprinting (see, e.g., Vos et al. 1995, Nucleic Acid Research 23: 4407-4414). A closely related plant may have a Jaccard's Similarity index of at least about 0.8, preferably at least about 0.9, 0.95, 0.98 or more (see, e.g., Parvathaneni et al., J. Crop Sci. Biotech. 2011 (March) 14 (1): 39-43). The disclosure also provides a plant obtained or selected by applying these methods on melon variety NUN 76207 MEM. Such a plant may be produced by traditional breeding techniques, or mutation or transformation or in another aspect, a plant may simply be identified and selected amongst plants of said variety, or progeny of said variety, e.g., by identifying a variant of melon variety NUN 76207 MEM, which variant differs from the variety described herein in one, two or three of the morphological and/or physiological characteristics (e.g., characteristics listed in Tables 1-3). In one aspect, the disclosure provides a plant of variety NUN 76207 MEM, having a Jaccard's Similarity index with said variety of at least 0.8, e.g., at least 0.85, 0.9, 0.95, 0.98 or even at least 0.99.

In some aspects, the disclosure provides a melon plant comprising genomic DNA having at least 95%, 96%, 97%, 98% or 99% sequence identity compared to the genomic DNA sequence of a plant of variety NUN 76207 MEM as to be deposited under Accession Number NCIMB 43532. In some aspects, the melon plant further comprises all or all but 1, 2, or 3 of the morphological and physiological characteristics of melon variety NUN 76207 MEM (e.g., as listed in Tables 1-3). In other aspects, the melon plant is a hybrid derived from a seed or plant of variety NUN 76207 MEM.

For the purpose of this disclosure, the "sequence identity" of nucleotide sequences, expressed as a percentage, refers to the number of positions in the two optimally aligned sequences which have identical residues ($\times 100$) divided by the number of positions compared. A gap, i.e., a position in the pairwise alignment where a residue is present in one sequence but not in the other, is regarded as a position with non-identical residues. A pairwise global sequence alignment of two nucleotide sequences is found by aligning the two sequences over the entire length according to the Needleman and Wunsch global alignment algorithm described in Needleman and Wunsch, 1970, J. Mol. Biol. 48(3):443-53). A full implementation of the Needleman-Wunsch global alignment algorithm is found in the needle program in The European Molecular Biology Open Software Suite (see, e.g., EMBOSS, Rice et al., Trends in Genetics June 2000, vol. 16, No. 6. pp. 276-277).

In one aspect, a plant of variety NUN 76207 MEM may also be mutated (by e.g., irradiation, chemical mutagenesis,

heat treatment, etc.) and mutated seeds or plants may be selected in order to change one or more characteristics of said variety. Methods such as TILLING (Targeting Induced Local Lesions in Genomes) may be applied to populations in order to identify mutants.

Similarly, melon variety NUN 76207 MEM may be transformed and regenerated, whereby one or more chimeric genes are introduced into the variety or into a plant comprising all but 1, 2, 3, or more of the morphological and physiological characteristics (e.g., as listed in Tables 1-3). Many useful traits can be introduced into melon variety NUN 76207 MEM by e.g., crossing melon variety NUN 76207 MEM with a transgenic melon plant comprising a desired transgene, as well as by directly introducing a transgene into melon variety NUN 76207 MEM by genetic transformation techniques.

Any pest or disease resistance genes may be introduced into melon variety NUN 76207 MEM, progeny of said variety or into a plant comprising all but 1, 2, or 3 or more of the morphological and physiological characteristics of melon variety NUN 76207 MEM (e.g., as listed in Tables 1-3). Resistance to one or more of the following diseases or pests may be introduced into melon variety NUN 76207 MEM: Bacterial Wilt, Root Rot, Crown Blight, Melon Rust, *Podosphaera xanthii* (*Sphaerotheca fuliginea*) race 1, *Podosphaera xanthii* (*Sphaerotheca fuliginea*) race 2, *Podosphaera xanthii* (*Sphaerotheca fuliginea*) race 3, *Podosphaera xanthii* (*Sphaerotheca fuliginea*) race 5, *Golovinomyces cichoracearum* (*Erysiphe cichoracearum*) race 1, *Verticillium* Wilt, Sulphur Burn, Scab, Downy Mildew, *Fusarium oxysporum* f.sp. *melonis* race 0, *Fusarium oxysporum* f.sp. *melonis* race 1, *Fusarium oxysporum* f.sp. *melonis* race 2, *Fusarium oxysporum* f.sp. *melonis* race 1-2, *Fusarium* Wilt R2, Root Knot (Nematode), Anthracnose, Aphid, Pickle Worm, Darkling Ground Beetle, Banded Cucumber Beetle, Mite, Western Spotted Cucumber Beetle, Melon Leafhopper, Melon Worm, Western Striped Cucumber Beetle and/or Melon Leafminer. Other resistances, against pathogenic viruses (e.g., Melon Necrotic Spot Virus (MNSV) resistance, Cucumber Mosaic Virus (CMV), Zucchini Yellow Mosaic Virus (ZYMV), Papaya Ringspot Virus (PRSV), Watermelon Mosaic Virus (WMV), Squash Mosaic Virus (SMV), fungi, bacteria, nematodes, insects, or other pests may also be introduced, or other traits such as Melon Yellowing associated Virus (MYaV) resistance and Whitefly resistance.

Genetic transformation may, therefore, be used to insert a selected transgene into the melon plants of the disclosure described herein or may, alternatively, be used for the preparation of transgenic melon plants which can be used as a source of the transgene(s), which can be introduced into melon variety NUN 76207 MEM by e.g., backcrossing. A genetic trait which has been engineered into the genome of a particular melon plant may then be moved into the genome of another melon plant (e.g., another variety) using traditional breeding techniques which are well known in the art. For example, backcrossing is commonly used to move a transgene from a transformed melon variety into an already developed melon variety and the resulting backcross conversion plant will then comprise the transgene(s).

Any DNA sequences, whether from a different species or from the same species, which are inserted into the genome using transformation, are referred to herein collectively as "transgenes." A "transgene" also encompasses antisense, or sense and antisense sequences capable of gene silencing. Thus, the disclosure also relates to transgenic plants of melon variety NUN 76207 MEM. In some aspects, a trans-

genic plant of melon variety NUN 76207 MEM may contain at least one transgene but could also contain at least 1, 2, 3, 4, or more transgenes.

Plant transformation involves the construction of an expression vector which will function in plant cells. Such a vector comprises DNA comprising a gene under control of, or operatively linked to a regulatory element active in plant cells (e.g., promoter). The expression vector may contain one or more such operably linked gene/regulatory element combinations. The vector may be in the form of a plasmid and can be used alone or in combination with other plasmids to provide transformed melon plants using transformation methods to incorporate transgenes into the genetic material of the melon plant(s). Transformation can be carried out using standard methods, such as *Agrobacterium tumefaciens* mediated transformation, electroporation, biolistics particle delivery system, or microprojectile bombardment, followed by selection of the transformed cells and regeneration into plants.

Plants can also be genetically engineered, modified, or manipulated to express various phenotypes of horticultural interest. Through the transformation of melon, the expression of genes can be altered to enhance disease resistance, insect resistance, herbicide resistance, stress tolerance, horticultural quality, and other traits. Transformation can also be used to insert DNA sequences which control or help control male sterility or fertility restoration. DNA sequences native to melon as well as non-native DNA sequences can be transformed into melon and used to alter levels of native or non-native proteins. Various promoters, targeting sequences, enhancing sequences, and other DNA sequences can be inserted into the genome for the purpose of altering the expression of proteins. Reduction of the specific activity of specific genes (also known as gene silencing or gene suppression) is desirable for several aspects of genetic engineering in plants.

Genome editing is another method recently developed to genetically engineer plants. Specific modification of chromosomal loci or targeted mutation can be done through sequence-specific nucleases (SSNs) by introducing a targeted DNA double strand break in the locus to be altered. Examples of SSNs that have been applied to plants are: finger nucleases (ZFNs), transcription activator-like effector nucleases (TALENs), engineered homing endonucleases or meganucleases, and clustered regularly interspaced short palindromic repeats (CRISPR)/CRISPR-associated protein 9 (Cas9), see, e.g., Songstad, et. al., Critical Reviews in Plant Sciences, 2017, 36:1, 1-23.

Thus, the disclosure provides a method of producing a melon plant having a desired trait comprising mutating the plant or plant part melon variety NUN 76207 MEM and selecting a plant comprising the desired trait, wherein the mutated plant retains all or all but one, two or three of the morphological and physiological characteristics of melon variety NUN 76207 MEM, optionally as described for each variety in Tables 1-3, and contains the desired trait and wherein a representative sample of seed of said variety has been deposited under Accession Number NCIMB 43532. In a further aspect, the desired trait is yield, storage properties, color, flavor, size, firmness, enhanced nutritional quality, post-harvest quality, male sterility, herbicide tolerance, insect resistance, pest resistance, disease resistance, environmental stress tolerance, modified carbohydrate metabolism, modified metabolism, or ripening, or the mutation occurs in the intense gene.

The disclosure also provides a method for inducing a mutation in melon variety NUN 76207 MEM, comprising:

- a. exposing the seed, plant or plant part or cell of melon variety NUN 76207 MEM, to a mutagenic compound or to radiation, wherein a representative sample of seed of said melon variety has been deposited under Accession Number NCIMB 43532;
- b. selecting the seed, plant or plant part or cell of melon variety NUN 76207 MEM, having a mutation; and
- c. optionally growing and/or multiplying the seed, plant or plant part or cell of melon variety NUN 76207 MEM, having the mutation.

The disclosure also provides a method of producing a melon plant having a desired trait, wherein the method comprises transforming the melon plant with a transgene that confers the desired trait, wherein the transformed plant otherwise retains all of the physiological and morphological characteristics of the plant of variety NUN 76207 MEM and contains the desired trait. Thus, a transgenic melon plant is provided which is produced by the method described above, wherein the plant comprises the desired trait and all of the physiological and morphological characteristics of the plant of variety NUN 76207 MEM.

In another aspect, the disclosure provides a method of producing a progeny of plant of variety NUN 76207 MEM further comprising a desired trait, said method comprising transforming the plant of melon variety NUN 76207 MEM with at least one transgene that confers the desired trait and/or crossing the plant of melon variety NUN 76207 MEM with a transgenic melon plant comprising a desired transgene so that the genetic material of the progeny that resulted from the cross contains the desired transgene(s). Also encompassed is the progeny produced by this method.

A desired trait (e.g., gene(s) conferring pest or disease resistance, or tolerance for protection, etc.) can be introduced into melon variety NUN 76207 MEM, or progeny of said variety, by transforming said variety or progeny of said variety with a transgene that confers the desired trait, wherein the transformed plant retains all or all but one, two or three of the morphological and/or physiological characteristics of melon variety NUN 76207 MEM, or the progeny of said variety, and contains the desired trait. In another aspect, the transformation or mutation confers a trait wherein the trait is yield, storage properties, color, flavor, size, male sterility, herbicide tolerance, insect resistance, pest resistance, disease resistance, environmental stress tolerance, modified carbohydrate metabolism, modified protein metabolism, ripening, or the mutation occurs in the intense gene. In a particular aspect, the specific transgene may be any known in the art, including, a polynucleotide sequence conferring resistance to imidazolinone, sulfonylurea, glyphosate, glufosinate, triazine, benzonitrile, cyclohexanedione, phenoxy propionic acid and L-phosphinothricin or a polynucleotide conferring resistance to Bacterial Wilt, Root Rot, Crown Blight, Melon Rust, *Podosphaera xanthii* (*Sphaerotheca fuliginea*) race 1, *Podosphaera xanthii* (*Sphaerotheca fuliginea*) race 2, *Podosphaera xanthii* (*Sphaerotheca fuliginea*) race 3, *Podosphaera xanthii* (*Sphaerotheca fuliginea*) race 5, *Golovinomyces cichoracearum* (*Erysiphe cichoracearum*) race 1, *Verticillium* Wilt, Sulphur Burn, Scab, Downy Mildew, *Fusarium oxysporum* f.sp. *melonis* race 0, *Fusarium oxysporum* f.sp. *melonis* race 1, *Fusarium oxysporum* f.sp. *melonis* race 2, *Fusarium oxysporum* f.sp. *melonis* race 1-2, *Fusarium* Wilt R2, Root Knot (Nematode), Anthracnose, Aphid, Pickle Worm, Darkling Ground Beetle, Banded Cucumber Beetle, Mite, Western Spotted Cucumber Beetle, Melon Leafhopper, Melon Worm, Western Striped Cucumber Beetle and/or Melon Leafminer. Other resistance genes, against patho-

genic viruses (e.g., Melon Necrotic Spot Virus (MNSV) resistance, Cucumber Mosaic Virus (CMV), Zucchini Yellow Mosaic Virus (ZYMV), Papaya Ringspot Virus (PRSV), Watermelon Mosaic Virus (WMV), Squash Mosaic Virus (SMV), fungi, bacteria, nematodes, insects, or other pests may also be introduced, or other traits such as Melon Yellowing associated Virus (MYaV) resistance and Whitefly resistance.

By crossing and/or selfing, (one or more) single traits may be introduced into melon variety NUN 76207 MEM (e.g., using backcrossing breeding schemes), while retaining the remaining morphological and physiological characteristics of said variety and/or while retaining one or more or all distinguishing characteristics. A single trait converted plant may thereby be produced. For example, disease resistance genes may be introduced, genes responsible for one or more quality traits, yield, etc. Both single genes (e.g., dominant or recessive) and one or more QTLs (quantitative trait loci) may be transferred into melon variety NUN 76207 MEM by breeding with said variety.

In another aspect, the disclosure provides a method of introducing a single locus conversion or single trait conversion or a desired trait into melon variety NUN 76207 MEM, comprising introducing a single locus conversion, single trait conversion, or a desired trait in at least one of the parents of melon variety NUN 76207 MEM, and crossing the converted parent with the other parent of melon variety NUN 76207 MEM, to obtain seed of said variety.

In another aspect, the step of introducing a single locus conversion, single trait conversion, or a desired trait in at least one of the parent plants comprises:

- a. crossing the parental line of melon variety NUN 76207 MEM, with a second melon plant comprising the single locus conversion, the single trait conversion, or the desired trait;
- b. selecting F1 progeny plants that comprise the single locus conversion, the single trait conversion, or the desired trait;
- c. crossing said selected progeny plants of step b) with the parental line of step a), to produce a backcross progeny plant;
- d. selecting backcross progeny plants comprising the single locus conversion, the single trait conversion, or the desired trait and otherwise all or all but one, two or three of the morphological and physiological characteristics the parental line of step a) to produce selected backcross progeny plants; and
- e. optionally repeating steps c) and d) one or more times in succession to produce selected second, third or fourth or higher backcross progeny plants comprising the single locus conversion, the single trait conversion, or the desired trait and otherwise all or all but one, two or three of the morphological and physiological characteristics the parental line of step a) to produce selected backcross progeny plants, when grown in the same environmental conditions.

The disclosure further relates to plants obtained by this method.

Alternatively, a single trait converted plant or single locus converted plant may be produced by:

- a. obtaining a cell or tissue culture of cells of melon variety NUN 76207 MEM;
- b. genetically transforming or mutating said cells;
- c. growing the cells into a plant; and
- d. optionally selecting the plant that contains the single locus conversion, the single trait conversion, or the desired trait.

In another aspect, the disclosure provides a method of introducing a single locus conversion or single trait conversion or a desired trait into melon variety NUN 76207 MEM, comprising:

- a. obtaining a combination of a parental lines of melon variety NUN 76207 MEM, optionally through reverse synthesis of breeding lines;
- b. introducing a single locus conversion, a single trait conversion, or a desired trait in at least one of the parents of step a); and
- c. crossing the converted parent with the other parent of step a) to obtain seed of melon variety NUN 76207 MEM.

In another method, the step of introducing a single locus conversion, single trait conversion, or a desired trait in at least one of the parents comprises genetically transforming or mutating cells the parental line of melon variety NUN 76207 MEM, growing the cells into a plant; and optionally selecting plants that contain the single locus conversion, the single trait conversion, or the desired trait.

In any of the above methods, where the single locus conversion concerns a trait, the trait may be yield or pest resistance or disease resistance. In one aspect, the trait is disease resistance and the resistance is conferred to Bacterial Wilt, Root Rot, Crown Blight, Melon Rust, *Podosphaera xanthii* (*Sphaerotheca fuliginea*) race 1, *Podosphaera xanthii* (*Sphaerotheca fuliginea*) race 2, *Podosphaera xanthii* (*Sphaerotheca fuliginea*) race 3, *Podosphaera xanthii* (*Sphaerotheca fuliginea*) race 5, *Golovinomyces cichoracearum* (*Erysiphe cichoracearum*) race 1, *Verticillium* Wilt, Sulphur Burn, Scab, Downy Mildew, *Fusarium oxysporum* f.sp. *melonis* race 0, *Fusarium oxysporum* f.sp. *melonis* race 1, *Fusarium oxysporum* f.sp. *melonis* race 2, *Fusarium oxysporum* f.sp. *melonis* race 1-2, *Fusarium* Wilt R2, Root Knot (Nematode), Anthracnose, Aphid, Pickle Worm, Darkling Ground Beetle, Banded Cucumber Beetle, Mite, Western Spotted Cucumber Beetle, Melon Leafhopper, Melon Worm, Western Striped Cucumber Beetle and/or Melon Leafminer. Other resistances, against pathogenic viruses (e.g., Melon Necrotic Spot Virus (MNSV) resistance, Cucumber Mosaic Virus (CMV), Zucchini Yellow Mosaic Virus (ZYMV), Papaya Ringspot Virus (PRSV), Watermelon Mosaic Virus (WMV), Squash Mosaic Virus (SMV), fungi, bacteria, nematodes, insects, or other pests may also be introduced, or other traits such as Melon Yellowing associated Virus (MYaV) resistance and Whitefly resistance.

The disclosure also provides a plant having one, two or three physiological and/or morphological characteristics which are different from those of melon variety NUN 76207 MEM and which otherwise has all the physiological and morphological characteristics of said variety, wherein a representative sample of seed of said melon variety has been deposited under Accession Number NCIMB 43532. In particular, variants are encompassed which differ from melon variety NUN 76207 MEM, in none, one, two or three of the characteristics mentioned in Tables 1-3 are encompassed.

The disclosure also provides a plant comprising at least a first set of the chromosomes of melon variety NUN 76207 MEM, a sample of seed has been deposited under Accession Number NCIMB 43532, optionally further comprising a single locus conversion. In another aspect, the single locus conversion confers a trait wherein the trait is yield, storage properties, color, flavor, size, firmness, enhanced nutritional quality, post-harvest quality, male sterility, herbicide tolerance, insect resistance, pest resistance, disease resistance,

environmental stress tolerance, modified carbohydrate metabolism, modified metabolism, or ripening.

In one aspect, the disclosure provides a haploid plant and/or a doubled haploid plant of melon variety NUN 76207 MEM, or a plant having all but one, two or three physiological and/or morphological characteristics of melon variety NUN 76207 MEM, or progeny of any of these. Haploid and doubled haploid (DH) plants can, for example, be produced by cell or tissue culture and chromosome doubling agents and regeneration into a whole plant. DH production chromosome doubling may be induced using known methods, such as colchicine treatment or the like. In one aspect, the method comprises inducing a cell or tissue culture with a chromosome doubling agent and regenerating the cells or tissues into a whole plant.

In another aspect, the disclosure comprises a method for making doubled haploid cells of melon variety NUN 76207 MEM, comprising making doubled haploid cells from haploid cells from the plant or plant of melon variety NUN 76207 MEM with a chromosome doubling agent such as colchicine treatment (see, e.g., Nikolova and Niemirowicz-Szczytt (1996) *Acta Soc Bot Pol* 65:311-317).

In another aspect, the disclosure provides for haploid plants and/or doubled haploid plants derived from melon variety NUN 76207 MEM that, when combined, make a set of parents of melon variety NUN 76207 MEM. The haploid plant and/or the doubled haploid plant of variety NUN 76207 MEM can be used in a method for generating parental lines of melon variety NUN 76207 MEM.

The disclosure also provides methods for determining the identity of parental lines of plants described herein, in particular the identity of the female line. US2015/0126380, which is hereby incorporated by reference, relates to a non-destructive method for analyzing maternal DNA of a seed. In this method, the DNA is dislodged from the seed coat surface and can be used to collect information on the genome of the maternal parent of the seed. This method for analyzing maternal DNA of a seed comprises contacting a seed with a fluid to dislodge DNA from the seed coat surface, and analyzing the DNA thus dislodged from the seed coat surface using methods known in the art. The skilled person is thus able to determine whether a seed has grown on a plant of a plant of variety NUN 76207 MEM, or is a progeny of said variety, because the seed coat of the seed is a maternal tissue genetically identical to melon variety NUN 76207 MEM. In one aspect, the disclosure relates to a maternal tissue of melon variety NUN 76207 MEM. In another aspect, the disclosure relates to a melon seed comprising a maternal tissue of melon variety NUN 76207 MEM. In another particular aspect, the disclosure provides a method of identifying the female parental line of melon variety NUN 76207 MEM by analyzing the seed coat of a seed of that variety. In another aspect, the skilled person can determine whether a seed is grown on melon variety NUN 76207 MEM, by analyzing the seed coat or another maternal tissue of said seed.

Using methods known in the art such as “reverse synthesis of breeding lines” or “reverse breeding”, it is possible to produce parental lines for a hybrid plant such as melon variety NUN 76207 MEM. A skilled person can take any individual heterozygous plant (called a “phenotypically superior plant” in Example 2 of US2015/0245570 hereby incorporated by reference in its entirety; melon variety NUN 76207 MEM is such plant) and generate a combination of parental lines (reverse breeding parental lines) that, when crossed, produce the variety NUN 76207 MEM. It is not necessary that the reverse breeding parental lines are iden-

tical to the original parental lines. Such new breeding methods are based on the segregation of individual alleles in the spores produced by a desired plant and/or in the progeny derived from the self-pollination of that desired plant, and on the subsequent identification of suitable progeny plants in one generation, or in a limited number of inbred cycles. Such a method is known from US2015/0245570 or from Wijnker et al., *Nature Protocols* Volume: 9, Pages: 761-772 (2014) DOI: doi:10.1038/nprot.2014.049. Thus, the disclosure provides a method for producing parental lines for a hybrid organism (e.g., melon variety NUN 76207 MEM), comprising in one aspect: a) defining a set of genetic markers present in a heterozygous form (H) in a partially heterozygous starting organism; b) producing doubled haploid lines from spores of the starting organism; c) genetically characterizing the doubled haploid lines thus obtained for the said set of genetic markers to determine whether they are present in a first homozygous form (A) or in a second homozygous form (B); and d) selecting at least one pair of doubled haploid lines that have complementary alleles for at least a subset of the genetic markers, wherein each member of the pair is suitable as a parental line for the hybrid organism.

In another aspect, the method for producing parental lines for hybrid organisms, e.g., of melon variety NUN 76207 MEM, which when crossed reconstitute the genome of melon variety NUN 76207 MEM, comprising:

- a) defining a set genetic markers that are present a heterozygous form (H) in a partially heterozygous starting organism;
- b) producing at least one further generation from the starting organism by self-pollination (e.g., F2 or F3 generation);
- c) selecting at least one pair of progeny organisms in which at least one genetic marker from the set is present in a complementary homozygous forms (B vs. A, or A vs. B); and
- d) optionally repeating steps b) and c) until at least one pair of progeny organisms that have complementary alleles for at least a subset of the genetic markers has been selected as parental lines for a hybrid.

The disclosure relates to a method of producing a combination of parental lines of a plant of variety NUN 76207 MEM, comprising making doubled haploid cells from haploid cells from said plant or a seed of that plant; and optionally crossing these parental lines to produce and collecting seeds. In another aspect, the disclosure relates to a combination of parental lines produced by this method. In still another aspect, the combination of parental lines can be used to produce a seed or plant of variety NUN 76207 MEM, when these parental lines are crossed. In still another aspect, the disclosure relates to a combination of parental lines from which a seed or plant having all physiological and/or morphological characteristics of melon variety NUN 76207 MEM (when the characteristics are determined at the 5% significance level for plants grown under the same conditions).

The disclosure also provides a combination of parental lines which, when crossed, produce a seed or plant having all physiological and/or morphological characteristics of melon variety NUN 76207 MEM, but one, two or three characteristics which are different (when grown under the same environmental conditions), as well as a seed or plant having all physiological and/or morphological characteristics of melon variety NUN 76207 MEM, but one, two or three characteristics which are different (when the characteristics are determined at the 5% significance level for plants grown under the same conditions).

In another aspect, a combination of a male and a female parental line of NUN 76207 MEM can be generated by methods described herein, for example, through reverse synthesis of breeding lines.

In another aspect, the disclosure provides a method of determining the genotype of a plant described herein comprising detecting in the genome (e.g., a sample of nucleic acids) of the plant at least a first polymorphism or an allele. The skilled person is familiar with many suitable methods of genotyping, detecting a polymorphism or detecting an allele including SNP (Single Nucleotide Polymorphism) genotyping, restriction fragment length polymorphism identification (RFLP) of genomic DNA, random amplified polymorphic detection (RAPD) of genomic DNA, amplified fragment length polymorphism detection (AFLP), polymerase chain reaction (PCR), DNA sequencing, allele specific oligonucleotide (ASO) probes, and hybridization to DNA microarrays or beads. Alternatively, the entire genome could be sequenced. The method may, in certain embodiments, comprise detecting a plurality of polymorphisms in the genome of the plant, for example, by obtaining a sample of nucleic acid from a plant and detecting in said nucleic acids a plurality of polymorphisms. The method may further comprise storing the results of the step of detecting the plurality of polymorphisms on a computer readable medium.

Also provided is a plant part obtained from variety NUN 76207 MEM (or from progeny of said variety or from a plant having all or all but one, two, or three of the physiological and morphological characteristics which are different from those of melon variety NUN 76207 MEM) or from a vegetatively propagated plant of variety NUN 76207 MEM (or from its progeny or from a plant having all or all but one, two, or three of the physiological and morphological characteristics which are different from those of melon variety NUN 76207 MEM), wherein said plant part is a fruit, a harvested fruit, a part of a fruit, a leaf, a part of a leaf, pollen, an ovule, a cell, a petiole, a shoot or a part thereof, a stem or a part thereof, a root or a part thereof, a root tip, a cutting, a seed, a part of a seed, seed coat or another maternal tissue which is part of a seed grown on said variety, a hypocotyl, cotyledon, a scion, a stock, a rootstock, a pistil, an anther, and a flower or a part thereof.

A part of the plant of variety NUN 76207 MEM (or of progeny of said variety or of a plant having all physiological and/or morphological characteristics but one, two or three which are different from those of said variety) encompasses any cells, tissues, organs obtainable from the seedlings or plants, such as but not limited to: a melon fruit or a part thereof, a cutting, hypocotyl, cotyledon, seed coat, pollen and the like. Such parts can be stored and/or processed further.

The disclosure also provides for a food product, a feed product, or a processed product comprising or consisting of a plant part described herein. Preferably, the plant part is a melon fruit or part thereof and/or an extract from a fruit or another plant part described herein comprising at least one cell of melon variety NUN 76207 MEM. The food or feed product may be fresh or processed, e.g., dried, grinded, powdered, pickled, chopped, cooked, roasted, in a sauce, in a sandwich, pasted, puréed or concentrated, juiced, sliced, canned, steamed, boiled, fried, blanched or frozen, etc.

Such a plant part of melon variety NUN 76207 MEM can be stored and/or processed further. The disclosure thus also provides for a food or a feed product comprising one or more of such parts, such as canned, chopped, cooked, roasted, in a sauce, in a sandwich, pasted, puréed or concentrated, juiced, frozen, dried, pickled, or powdered melon fruit from

melon variety NUN 76207 MEM or from progeny of said variety, or from a derived variety, such as a plant having all but one, two or three physiological and/or morphological characteristics of melon variety NUN 76207 MEM.

The disclosure further provides for food or feed products comprising part, or part of progeny of melon variety NUN 76207 MEM, or part of a plant having all but one, two, or three of the physiological and morphological characteristics of melon variety NUN 76207 MEM, comprising one or more of such parts, optionally processed (e.g., canned, chopped, cooked, roasted, in a sauce, in a sandwich, pasted, pureed or concentrated, juiced, frozen, dried, pickled, or powdered).

In another aspect, the plant, plant part or seed of melon variety NUN 76207 MEM is inside one or more containers. For example, the disclosure provides containers such as cans, boxes, crates, bags, cartons, Modified Atmosphere Packaging, films (e.g., biodegradable films), etc. comprising a plant or part of a plant (fresh and/or processed) or a seed of melon variety NUN 76207 MEM. In a particular aspect, the container comprises a plurality of seeds of melon variety NUN 76207 MEM, or a plurality of plant parts of melon variety NUN 76207 MEM.

In another aspect, the disclosure provides for a melon fruit of variety NUN 76207 MEM, or part of a fruit of said variety. The fruit can be in any stage of maturity, for example, immature or mature. In another aspect, the disclosure provides for a container comprising or consisting of a plurality of harvested melon fruits or parts of fruits of said variety, or fruits of progeny thereof, or fruits of a derived variety.

Marketable fruits are generally sorted by size and quality after harvest. Alternatively, the fruits can be sorted by expected shelf life, pH or Brix.

Melons may also be grown for use as rootstocks (stocks) or scions. Typically, different types of melons are grafted to enhance disease resistance, which is usually conferred by the rootstock, while retaining the horticultural qualities usually conferred by the scion. It is not uncommon for grafting to occur between cultivated melon varieties and related melon species. Methods of grafting and vegetative propagation are well-known in the art.

In another aspect, the disclosure provides to a plant comprising a rootstock or scion of melon variety NUN 76207 MEM.

Development of Melon Variety NUN 76207 MEM

The hybrid variety NUN 76207 MEM was developed from a male and female proprietary inbred line of Nunhems B.V. The female and male parents were crossed to produce hybrid (F1) seeds of melon variety NUN 76207 MEM. The seeds of melon variety NUN 76207 MEM can be grown to produce hybrid plants and parts thereof (e.g., melon fruit). The hybrid variety NUN 76207 MEM can be propagated by seeds or vegetatively.

The hybrid variety is uniform and genetically stable. This has been established through evaluation of horticultural

characteristics. Several hybrid seed production events resulted in no observable deviation in genetic stability. Coupled with the confirmation of genetic stability of the respective female and male parents the Applicant has concluded that melon variety NUN 76207 MEM is uniform and stable.

Deposit Information

A total of 2500 seeds of the hybrid variety NUN 76207 MEM has been deposited and accepted according to the Budapest Treaty by Nunhems B.V. on Dec. 18, 2020, at the NCIMB Ltd., Ferguson Building, Craibstone Estate, Bucksburn, Aberdeen AB21 9YA, United Kingdom (NCIMB). The deposit has been assigned NCIMB number 43532. A statement indicating the viability of the sample has been provided. A deposit of melon variety NUN 76207 MEM and of the male and female parent line is also maintained at Nunhems B.V.

The deposit will be maintained in NCIMB for a period of 30 years, or 5 years after the most recent request, or for the enforceable life of the patent whichever is longer and will be replaced if it ever becomes nonviable during that period. Access to the deposits will be available during the pendency of this application to persons determined by the Director of the U.S. Patent Office to be entitled thereto upon request. Subject to 37 C.F.R. § 1.808(b), all restrictions imposed by the depositor on the availability to the public of the deposited material will be irrevocably removed upon the granting of the patent. Applicant does not waive any rights granted under this patent on this application or under the Plant Variety Protection Act (7 U.S.C. § 2321 et seq.). Accordingly, the requirements of 37 CFR § 1.801-1.809 have been satisfied.

Characteristics of Melon Variety NUN 76207 MEM

The most similar variety to NUN 76207 MEM refers to variety Fiji F1, a variety from Harris Moran. In Tables 1-2, a comparison between melon variety NUN 76207 MEM and the Reference Variety are shown based on a trial in Acampo, Calif., USA. Seeding date: Jun. 13, 2019; Harvesting date: Sep. 5, 2019. In Table 3, the disease resistances of melon variety NUN 76207 MEM and the Reference Variety are shown. In Table 4, the distinguishing characteristics between melon variety NUN 76207 MEM and the Reference Variety are presented.

One replication of 20 plants per variety, from which at least 15 plants or plant parts were randomly selected and were used to measure characteristics. For numerical characteristics, averages were calculated. For non-numerical characteristics, the type/degree were determined.

In one aspect, the disclosure provides a plant having the physiological and morphological characteristics of melon variety NUN 76207 MEM as presented in Tables 1-3.

TABLE 1

Objective Description of Melon Variety NUN 76207 MEM and the Reference Variety (USDA Descriptors)		
Characteristics	Application variety (NUN 76207 MEM)	Reference Variety (Fiji F1)
Type:	Cantaloupe	Cantaloupe
Persian, Honey Dew, Casaba, Crenshaw, Common/Summer, Other	Long Shelf life	Long Shelf life
Area of best adaptation in USA:	Arizona, California	Arizona, California
Southeast, Northeast/North Central, Southwest, Most Areas, East coast		
Maturity:	85 days	90 days

TABLE 1-continued

Objective Description of Melon Variety NUN 76207 MEM and the Reference Variety (USDA Descriptors)		
Characteristics	Application variety (NUN 76207 MEM)	Reference Variety (Fiji F1)
Days from seeding to harvest		
Plant:		
Fertility:	Monoecious	Monoecious
Andromonoecious, Monoecious, Gynoecious, Other		
Habit:	Vine	Vine
Vine, Semi-bush, Bush		
Leaf (mature blade of third leaf:		
Shape:	Reniform	Reniform
Orbicular, Ovate, Reniform (Cordate)		
Lobes:	Shallowly lobed	Shallowly lobed
Not Lobed, Shallowly Lobed, Deeply Lobed		
Color:	Dark green	Medium green
Light Green (Honey Dew), Medium Green, Dark Green (Rio Gold)	(RHS N137A)	(RHS N137C)
Length (mm):	12.79 mm	13.69 mm
Width (mm):	15.29 mm	16.42 mm
Surface:	Scabrous	Scabrous
Pubescent, Glabrous, Scabrous		
Fruit (at edible maturity):		
Length (cm):	16.75 cm	16.69 cm
Diameter (cm):	14.20 cm	13.69 cm
Weight (gram):	1,673.60 g	1,770.67 g
Shape:	Oval	Oval
Oblate, Oval, Round, Elongate- Cylindrical, Spindle, Acorn		
Surface:	Netted	Netted
Smooth, Netted, Corrugated, Warty		
Blossom Scar:	Conspicuous	Conspicuous
Obscure, Conspicuous		
Rib Presence:	Absent	Absent
Absent, Present		
Shipping Quality:	Excellent	Excellent
Poor (Home Garden), Fair (Short Distance Shipping), Excellent (Long Distance Shipping)		
Fruit Abscission:	When overripe	When overripe
When Ripe, When Overripe, Do Not Abscise		
Rind Net:		
Net Presence:	Abundant	Abundant
Absent, Sparse, Abundant		
Distribution:	Covers entire	Covers entire
Spotty, Covers Entire Fruit		
Coarseness:	Medium	Medium
Fine, Medium Coarse, Very Coarse		
Interlacing:	Complete	Complete
None, Some, Complete		
Interstices:	Shallow	Shallow to medium
Shallow, Medium Deep, Deep		
Rind Texture:		
Texture:	Firm	Firm
Soft, Firm, Hard		
Thickness at Medial (mm):	43.33 mm	39.40 mm
Rind Color:		
Rind Color at Edible Maturity:		
Primary Color:	Moderate yellow green	Greyish yellow green
	(RHS 147C)	(RHS 194B)
Net Color:	Darker pale yellow	Pale yellow
	(RHS 161C)	(RHS 161D)
Flesh (at edible maturity):		
Color Near Cavity:	Pale moderate orange	Lighter Moderate orange
	(RHS 168D)	(RHS N167C)
Color in Center:	Darker moderate orange	Moderate greyed-orange
	(RHS 167B)	(RHS 167C)

TABLE 1-continued

Objective Description of Melon Variety NUN 76207 MEM and the Reference Variety (USDA Descriptors)		
Characteristics	Application variety (NUN 76207 MEM)	Reference Variety (Fiji F1)
Color Near Rind:	Lighter moderate orange (RHS N167C)	Darker moderate orange (RHS 167B)
Refractometer % Soluble Solids (Center of Flesh):	13.86%	13.30%
Aroma: Absent, Faint, Strong	Absent	Absent
Flavor: Mild, Somewhat Spicy, Very Spicy	Mild	Mild
Seed Cavity:		
Length (mm):	118.69 mm	116.05 mm
Width (mm):	63.47 mm	58.86 mm
Shape in X-Section: Circular, Triangular	Triangular	Triangular

TABLE 2

Objective Description of Melon variety NUN 76207 MEM and the Reference Variety (Non-USDA Descriptors)		
Characteristics	Application variety (NUN 76207 MEM)	Reference Variety (Fiji F1)
Leaf (mature blade of 3 rd leaf):		
Development of lobes: Weak, medium, strong	Weak	Very weak to weak
Length of terminal lobe: Short, medium, long	Short	Short
Dentation of margin: Weak, medium, strong	Very weak	Very weak
Blistering: Weak, medium, strong	Very weak	Very weak
Intensity of green color: Light, medium, dark	Dark	Medium to dark
Size: Small, medium, large	Medium	Medium
Petiole attitude: Erect, semi-erect, horizontal	Semi-erect	Semi-erect
Petiole length (mm):	98.76 mm	110.24 mm
Petiole width (mm):	6.85 mm	6.66 mm
Young fruit (unripe fruit, before the color change):		
Length of peduncle (mm):	44.38 mm	39.19 mm
Thickness of peduncle 1 m from fruit: Thin, medium, thick	Medium	medium
Thickness of peduncle (mm):	8.16 mm	8.09 mm
Fruit (at edible maturity):		
Ratio of length/diameter (cm):	1.18 cm	1.21 cm
Position of maximum diameter: Toward stem end, ata middle, toward blossom end	At middle	At middle
Shape in longitudinal section: Flattened, round, egg-shaped, elliptic, elongated	Broad elliptic	Medium to broad elliptic
Shape of base: Pointed, rounded, truncate	Rounded	Rounded
Shape of apex: Pointed, rounded, truncate	Rounded	Rounded
Blossom scar diameter (mm):	23.07 mm	21.38 mm
Size of pistil scar: Small, medium, large	Medium	Small to medium
Creasing of surface: Absent or very weak, weak, medium, strong, very strong	Absent or very weak	Absent or very weak
Cork formation: Absent, present	Present	Present

TABLE 2-continued

Objective Description of Melon variety NUN 76207 MEM and the Reference Variety (Non-USDA Descriptors)		
Characteristics	Application variety (NUN 76207 MEM)	Reference Variety (Fiji F1)
Thickness of cork layer: Very thin, thin, medium, thick, very thick	Thin	Thin to medium
Pattern of cork formation: Dots only, dots and linear, linear only, linear and netted, netted only	Netted only	Netted only
Density of pattern of cork formation: Very sparse, medium, dense, very dense	Dense	Dense
Strength of attachment of peduncle at maturity: Very weak, weak, medium, strong, very strong	Medium	Medium
Rind color:		
Ground color of skin: White, yellow, green, gray	Greenish yellow	Yellowish
Intensity of ground color of skin: Thin, medium, dark	Light	Medium
Density of dots: Absent or very sparse, sparse, medium, dense, very dense	Absent	Absent
Density of patches: Absent or very sparse, sparse, medium, dense, very dense	Absent or very sparse	Absent or very sparse
Size of patches: Small, medium, large	Very small	Very small
Warts: Absent, present	Absent	Absent
Flesh (at edible maturity):		
Width of flesh in longitudinal section (at a position of maximum fruit diameter): Thin, medium, thick	Medium	Medium
Penetrometer (kg): Seeds:	3.77 kg	2.41 kg
Size: Small, medium, large	Small to medium	Small to medium
Shape: Not pine-nut shape, pine-nut shape	Pine nut	Pine nut
Color: Whitish, cream yellow	Whitish	Whitish

The invention claimed is:

1. A plant, plant part, or seed of melon variety NUN 76207 MEM, wherein a representative sample of seed of said melon variety has been deposited under Accession Number NCIMB 43532.

2. The plant part of claim 1, wherein said plant part is a leaf, pollen, an ovule, a cell, a fruit, a scion, a root, a rootstock, a cutting, or a flower.

3. A seed that produces the plant of claim 1.

4. A seed grown on the plant of claim 1, wherein the plant grown from said seed does not differ from the plant of claim 1 when the numerical characteristics are determined at the 5% significance level or identical for non-numerical characteristics when grown under the same environmental conditions, and wherein a representative sample of seed of melon variety NUN 76207 MEM has been deposited under Accession Number NCIMB 43532.

5. A melon plant or part thereof having all of the physiological and morphological characteristics of the plant of claim 1.

6. A melon plant or a part thereof derived from the plant of claim 1 which does not differ from the plant of claim 1 in the characteristics listed in Tables 1-3, when the numerical characteristics are determined at the 5% significance level or identical for non-numerical characteristics when grown under the same environmental conditions, and wherein a representative sample of seed of melon variety NUN 76207 MEM has been deposited under Accession Number NCIMB 43532.

7. A tissue or cell culture comprising regenerable cells of the plant or plant part of claim 1.

8. The tissue or cell culture according to claim 7, comprising cells or protoplasts derived from a plant part suitable for vegetative reproduction, wherein the plant part is an embryo, a meristem, a fruit, a leaf, pollen, an ovule, a cell, a petiole, a shoot, a stem, a root, a root tip, a cutting, a hypocotyl, a cotyledon, a scion, a stock, a rootstock, a pistil, an anther, a flower, a seed, a stem, or a stalk.

9. A melon plant regenerated from the tissue or cell culture of claim 7, wherein the plant has all of the physiological and morphological characteristics of the plant of

43

variety NUN 76207 MEM, when the numerical characteristics are determined at the 5% significance level or identical for non-numerical characteristics for plants grown under the same environmental conditions, and wherein a representative sample of seed of said melon variety has been deposited under Accession Number NCIMB 43532.

10. A method of producing the plant claim 1 or a part thereof, said method comprising vegetatively propagating at least a part of the plant of melon variety NUN 76207 MEM, wherein a representative sample of seed of said melon variety has been deposited under Accession Number NCIMB 43532.

11. The method of claim 10, wherein said vegetative propagation comprises regenerating a whole plant from said part of the plant of melon variety NUN 76207 MEM, wherein a representative sample of seed of said melon variety has been deposited under Accession Number NCIMB 43532.

12. The method of claim 10, wherein said part is a cutting, a cell culture, or a tissue culture.

13. A vegetatively propagated plant or a part thereof produced by the method of claim 10, wherein the plant or part thereof has all of the physiological and morphological characteristics of the plant of melon variety NUN 76207 MEM, when the numerical characteristics are determined at the 5% significance level or identical for non-numerical characteristics for plants grown under the same environmental conditions, and wherein a representative sample of seed of said melon variety has been deposited under Accession Number NCIMB 43532.

14. A method of producing a melon plant, said method comprising crossing the plant of claim 1 with a second plant at least once, and selecting a progeny melon plant from said crossing and optionally allowing the progeny melon plant to form seed.

15. A method of producing a melon plant, said method comprising crossing melon plants and harvesting the resultant seed, wherein at least one melon plant is the plant of claim 1, wherein a representative sample of seed of said melon variety NUN 76207 MEM has been deposited under Accession Number NCIMB 43532.

16. A first generation progeny plant of the plant of claim 1, obtained by selfing or cross-pollinating the plant of claim 1 with another melon plant, wherein said progeny plant has all of the physiological and morphological characteristics of the plant of melon variety NUN 76207 MEM, when the numerical characteristics are determined at the 5% significance level or identical for non-numerical characteristics for plants grown under the same environmental conditions, and wherein a representative sample of seed of said melon variety has been deposited under Accession Number NCIMB 43532.

17. A melon plant derived from the plant of claim 1 having one physiological or morphological characteristic which is different from the plant of claim 1 and which otherwise has all the physiological and morphological characteristics of the plant of melon variety NUN 76207 MEM, when the characteristics are determined at the 5% significance level for plants grown under the same environmental conditions, and wherein a representative sample of seed of said melon variety has been deposited under Accession Number NCIMB 43532.

18. A method of introducing a single locus conversion into the plant of claim 1, comprising:

- a. crossing the plant of claim 1 with a second melon plant comprising a desired single locus to produce F1 progeny plants;

44

- b. selecting F1 progeny plants that have the single locus to produce selected F1 progeny plants;
- c. crossing the selected F1 progeny plants with melon variety NUN 76207 MEM to produce backcross progeny plants;
- d. selecting backcross progeny plants that have the single locus and otherwise comprise all of the physiological and morphological characteristics of melon variety NUN 76207 MEM to produce selected backcross progeny plants; and
- e. repeating steps (c) and (d) one or more times in succession to produce selected second or higher backcross progeny plants that comprise the single locus and otherwise comprise all of the physiological and morphological characteristics of melon variety NUN 76207 MEM, wherein a representative sample of seed of said variety has been deposited under Accession Number NCIMB 43532.

19. The method of claim 18, wherein the single locus confers yield, storage properties, color, flavor, size, firmness, enhanced nutritional quality, post-harvest quality, male sterility, herbicide tolerance, insect resistance, pest resistance, disease resistance, environmental stress tolerance, modified carbohydrate metabolism, modified metabolism, or ripening.

20. A melon plant produced by the method of claim 18, wherein the plant otherwise has all of the morphological and physiological characteristics of the plant of melon variety NUN 76207 MEM, further comprising the single locus conversion.

21. A method of producing doubled haploid cells of the plant of claim 1, said method comprising making doubled haploid cells from haploid cells from the plant or seed of melon variety NUN 76207 MEM, wherein a representative sample of seed of said melon variety has been deposited under Accession Number NCIMB 43532.

22. A method of grafting the scion or rootstock, comprising attaching tissue from the scion or rootstock of claim 2 to the tissue of a second plant, and optionally regenerating a plant therefrom.

23. A container comprising the plant, plant part, or seed of claim 1.

24. A food product, or a feed product, or a processed product comprising the plant part of claim 2, wherein the plant part is a fruit or a part thereof.

25. A method of introducing a desired trait into the plant of claim 1, comprising transforming the plant of claim 1 with a transgene that confers the desired trait, wherein the desired trait is yield, storage properties, color, flavor, size, firmness, enhanced nutritional quality, post-harvest quality, male sterility, herbicide tolerance, insect resistance, pest resistance, disease resistance, environmental stress tolerance, modified carbohydrate metabolism, modified metabolism, or ripening.

26. A melon plant produced by the method of claim 25, wherein the transformed plant otherwise retains all of the morphological and physiological characteristics of melon variety NUN 76207 MEM and contains the desired trait.

27. A method of producing a modified melon plant, said method comprising mutating the melon plant or plant part of claim 1, and selecting a mutated plant with a desired trait, wherein the mutated plant contains the desired trait and otherwise retains all of the physiological and morphological characteristics of melon variety NUN 76207 MEM, when the numerical characteristics are determined at the 5% significance level or identical for non-numerical characteristics for plants grown under the same environmental con-

45

ditions, wherein a representative sample of seed of said melon variety has been deposited under Accession Number NCIMB 43532, and wherein the desired trait is yield, storage properties, color, flavor, size, firmness, enhanced nutritional quality, post-harvest quality, male sterility, herbicide tolerance, insect resistance, pest resistance, disease resistance, environmental stress tolerance, modified carbohydrate metabolism, modified metabolism, or ripening, or the mutation occurs in the intense gene.

28. A method of producing a melon fruit, said method comprising growing the plant of claim 1 until it sets at least one fruit and collecting at least one fruit.

29. A method of collecting pollen of the plant of claim 1, said method comprising growing the plant of claim 1 until at least one flower contains pollen and collecting the pollen.

30. A method for determining the genotype of the plant of claim 1, said method comprising obtaining a sample of nucleic acids from said plant and detecting in said nucleic acid a plurality of polymorphisms, thereby determining the

46

genotype of the plant and storing the results of detecting the plurality of polymorphisms on a computer readable medium.

31. A method of producing a melon plant derived from the plant of claim 1 comprising:

- a. preparing a progeny melon plant derived from melon variety NUN 76207 MEM by crossing the plant of claim 1 with itself or with a second melon plant;
- b. crossing the progeny plant with itself or a second melon plant to produce seed of a progeny plant of a subsequent generation;
- c. growing a progeny plant of a subsequent generation from said seed and crossing the progeny plant of a subsequent generation with itself or a second melon plant; and
- d. repeating steps (b) and/or (c) for at least one more generation to produce a melon plant derived from melon variety NUN 76207 MEM.
