CROSS-REFERENCE

This application is a continuation of International Application No. PCT/CN2022/128916, filed Nov. 1, 2022, which claims the benefit of International Application No. PCT/CN2021/128243, filed Nov. 2, 2021 and International Application No. PCT/CN2022/117034, filed Sep. 5, 2022; which are incorporated herein by reference in their entirety.

BACKGROUND

SARS-CoV-2 (also known as 2019-nCoV or COVID-19) first appeared in 2019. Symptoms linked with the disease include fever, myalgia, cough, dyspnea, and fatigue (Huang et al., 2020). Currently, there is no treatment available for SARS-CoV-2. Nevertheless, treatments with well-known drugs such as chloroquine or investigational drugs such as remdesivir are suggested for this disease (Colson et al., 2020; Wang et al., 2020). A cocktail of human immunodeficiency virus (HIV) drugs, lopinavir/ritonavir is also being investigated as a therapy for SARS-CoV-2 as they exhibited anti-coronavirus effect in vitro (Que et al., 2003; Chu et al., 2004; Chan et al., 2015; Li and De Clercq, 2020).

SARS-CoV-2 is a beta-coronavirus and is member of the family Coronaviridae, which comprises the largest positive-sense, single-stranded RNA viruses. (Cui et al., 2019). The virus contains four non-structural proteins: papain-like (PL^{pro}) and 3-chymotrypsin-like (3CL^{pro}) proteases, RNA polymerase and helicase (Zumla et al., 2016). Both proteases (PL^{pro} and 3CL^{pro}) are involved with transcription and replication of the virus. Amongst the four types, the 3CL^{pro} is considered to be mainly involved in the replication of the virus (de Wit et al., 2016). 3CL^{pro} hydrolyses the viral polyproteins ppla and pplab to produce functional proteins during coronavirus replication. A study reported that the cysteine protease 3CL^{pro} of SARS-CoV-2 showed 96% sequence similarity with that of SARS-CoV (Xu et al., 2020). Because of its highly conserved sequence and essential functional properties, 3CL^{pro} has been validated as a potential target for the development of drugs to treat SARS-CoV-2.

Because viable treatments remain elusive, there is a need for a compound and/or method for inhibiting SARS-CoV-2 and for a treatment for a subject infected with the SARS-CoV-2.

DETAILED DESCRIPTION

Definitions

In the following description, certain specific details are set forth in order to provide a thorough understanding of various embodiments. However, one skilled in the art will understand that the disclosure may be practiced without these details. In other instances, well-known structures have not been shown or described in detail to avoid unnecessarily obscuring descriptions of the embodiments. Unless the context requires otherwise, throughout the specification and claims which follow, the word “comprise” and variations thereof, such as, “comprises” and “comprising” are to be construed in an open, inclusive sense, that is, as “including, but not limited to.” Further, headings provided herein are for convenience only and do not interpret the scope or meaning of the claimed disclosure.

Further Forms of Compounds Disclosed Herein Isomers/Stereoisomers

In some embodiments, the compounds described herein exist as geometric isomers. In some embodiments, the compounds described herein possess one or more double bonds. The compounds presented herein include all cis, trans, syn, anti, entgegen (E), and zusammen (Z) isomers as well as the corresponding mixtures thereof. In some situations, the compounds described herein possess one or more chiral centers and each center exists in the R configuration, or S configuration. The compounds described herein include all diastereomeric, enantiomeric, and epimeric forms as well as the corresponding mixtures thereof. In additional embodiments of the compounds and methods provided herein, mixtures of enantiomers and/or diastereoisomers, resulting from a single preparative step, combination, or interconversion are useful for the applications described herein. In some embodiments, the compounds described herein are prepared as their individual stereoisomers by reacting a racemic mixture of the compound with an optically active resolving

agent to form a pair of diastereoisomeric compounds, separating the diastereomers and recovering the optically pure enantiomers. In some embodiments, dissociable complexes are preferred. In some embodiments, the diastereomers have distinct physical properties (e.g., melting points, boiling points, solubilities, reactivity, etc.) and are separated by taking advantage of these dissimilarities. In some embodiments, the diastereomers are separated by chiral chromatography, or preferably, by separation/resolution techniques based upon differences in solubility. In some embodiments, the optically pure enantiomer is then recovered, along with the resolving agent, by any practical means that would not result in racemization.

In certain embodiments wherein the patient's condition does not improve, upon the doctor's discretion the administration of the compounds are administered chronically, that is, for an extended period of time, including throughout the duration of the patient's life in order to ameliorate or otherwise control or limit the symptoms of the patient's disease or condition.

In certain embodiments wherein a patient's status does improve, the dose of drug being administered is temporarily reduced or temporarily suspended for a certain length of time (i.e., a "drug holiday"). In specific embodiments, the length of the drug holiday is between 2 days and 1 year, including by way of example only, 2 days, 3 days, 4 days, 5 days, 6 days, 7 days, 10 days, 12 days, 15 days, 20 days, 28 days, or more than 28 days. The dose reduction during a drug holiday is, by way of example only, by 10%-100%, including by way of example only 10%, 15%, 20%, 25%, 30%, 35%, 40%, 45%, 50%, 55%, 60%, 65%, 70%, 75%, 80%, 85%, 90%, 95%, and 100%.

Once improvement of the patient's conditions has occurred, a maintenance dose is administered if necessary. Subsequently, in specific embodiments, the dosage, or the frequency of administration, or both, is reduced, as a function of the symptoms, to a level at which the improved disease, disorder or condition is retained. In certain embodiments, however, the patient requires intermittent or daily treatment on a long-term basis upon any recurrence of symptoms.

The amount of a given agent that corresponds to such an amount varies depending upon factors such as the particular compound, disease condition and its severity, the identity

(e.g., weight, sex) of the subject or host in need of treatment, but nevertheless is determined according to the particular circumstances surrounding the case, including, e.g., the specific agent being administered, the route of administration, the condition being treated, and the subject or host being treated.

In general, however, doses employed for adult human treatment are typically in the range of 0.01 mg-5000 mg per day. In one aspect, doses employed for adult human treatment are from about 1 mg to about 1000 mg per day. In one embodiment, the desired dose is conveniently presented in a single dose or in divided doses administered simultaneously or at appropriate intervals, for example as two, three, four or more sub-doses per day.

In one embodiment, the daily dosages appropriate for the compound described herein, or a pharmaceutically acceptable salt thereof, are from about 0.01 to about 50 mg/kg per body weight. In some embodiments, the daily dosage, or the amount of active in the dosage form are lower or higher than the ranges indicated herein, based on a number of variables in regard to an individual treatment regime. In various embodiments, the daily and unit dosages are altered depending on a number of variables including, but not limited to, the activity of the compound used, the disease or condition to be treated, the mode of administration, the requirements of the individual subject, the severity of the disease or condition being treated, and the judgment of the practitioner.

Toxicity and therapeutic efficacy of such therapeutic regimens are determined by standard pharmaceutical procedures in cell cultures or experimental animals, including, but not limited to, the determination of the LD₁₀ and the ED₉₀. The dose ratio between the toxic and therapeutic effects is the therapeutic index and it is expressed as the ratio between LD₅₀ and ED₅₀. In certain embodiments, the data obtained from cell culture assays and animal studies are used in formulating the therapeutically effective daily dosage range and/or the therapeutically effective unit dosage amount for use in mammals, including humans. In some embodiments, the daily dosage amount of the compounds described herein lies within a range of circulating concentrations that include the ED₅₀ with minimal toxicity. In certain embodiments, the daily dosage range and/or the unit dosage amount varies within this range depending upon the dosage form employed and the route of administration utilized.

In any of the aforementioned aspects are further embodiments in which the effective amount of the compound described herein, or a pharmaceutically acceptable salt thereof, is: (a) systemically administered to the mammal; and/or (b) administered orally to the mammal; and/or (c) intravenously administered to the mammal; and/or (d) administered by injection to the mammal; and/or (e) administered topically to the mammal; and/or (f) administered non-systemically or locally to the mammal.

In any of the aforementioned aspects are further embodiments comprising single administrations of the effective amount of the compound, including further embodiments in which (i) the compound is administered once a day; or (ii) the compound is administered to the mammal multiple times over the span of one day.

In any of the aforementioned aspects are further embodiments comprising multiple administrations of the effective amount of the compound, including further embodiments in which (i) the compound is administered continuously or intermittently: as in a single dose; (ii) the time between multiple administrations is every 6 hours; (iii) the compound is administered to the mammal every 8 hours; (iv) the compound is administered to the subject every 12 hours; (v)

the compound is administered to the subject every 24 hours. In further or alternative embodiments, the method comprises a drug holiday, wherein the administration of the compound is temporarily suspended or the dose of the compound being administered is temporarily reduced; at the end of the drug holiday, dosing of the compound is resumed. In one embodiment, the length of the drug holiday varies from 2 days to 1 year.

Combination

Disclosed herein are methods of treating a disease or disorder associated with SARS-COV-2 using a compound disclosed herein, or a pharmaceutically acceptable salt, solvate, or stereoisomer thereof, in combination with an additional therapeutic agent.

In some embodiments, the additional therapeutic agent is administered at the same time as the compound disclosed herein. In some embodiments, the additional therapeutic agent and the compound disclosed herein are administered sequentially. In some embodiments, the additional therapeutic agent is administered less frequently than the compound disclosed herein. In some embodiments, the additional therapeutic agent is administered more frequently than the compound disclosed herein. In some embodiments, the additional therapeutic agent is administered prior than the administration of the compound disclosed herein. In some embodiments, the additional therapeutic agent is administered after the administration of the compound disclosed herein.

In some embodiments, the additional therapeutic agent is an interferon, such as interferon alpha, or a pegylated interferon, such as PEG-intron or Pegasus. In some embodiments, this combination provides a greater clinical benefit than dosing either the interferon, pegylated interferon or the compound disclosed herein alone. Examples of greater clinical benefits include a larger reduction in symptoms, a faster time to alleviation of symptoms, reduced lung pathology, a larger reduction in the amount of SARS coronavirus in the patient (viral load), and decreased mortality.

The SARS coronavirus infects cells which express p-glycoprotein. In some embodiments, the compounds disclosed herein are p-glycoprotein substrates. In some embodiments, compounds which inhibit the SARS coronavirus which are also p-glycoprotein substrates are dosed with a p-glycoprotein inhibitor. Examples of p-glycoprotein inhibitors include verapamil, vinblastine, ketoconazole, nelfinavir, ritonavir, and cyclosporine. The p-glycoprotein inhibitors act by inhibiting the efflux of the compounds disclosed herein out of the cell. The inhibition of the p-glycoprotein based efflux will prevent reduction of intracellular concentrations of the compound disclosed herein due to p-glycoprotein efflux. Inhibition of the p-glycoprotein efflux will result in larger intracellular concentrations of the compound disclosed herein. In some embodiments, dosing a SARS coronavirus infected patient with the compound disclosed herein and a p-glycoprotein inhibitor lower the amount of the compound disclosed herein required to achieve an efficacious dose by increasing the intracellular concentration of the compound disclosed herein.

Among the agents that may be used to increase the exposure of a mammal to a compound disclosed herein are those that can inhibit at least one isoform of the cytochrome P450 (CYP450) enzymes. The isoforms of CYP450 that may be beneficially inhibited include, but are not limited to, CYP1A2, CYP2D6, CYP2C9, CYP2C19 and CYP3A4. In

91

some embodiments, the compounds disclosed herein include compounds that are CYP3A4 substrates and are metabolized by CYP3A4. In some embodiments, dosing a SARS coronavirus infected patient with a compound that is a CYP3A4 substrate and a CYP3A4 inhibitor, such as ritonavir, nelfinavir or delavirdine, will reduce the metabolism of the compound by CYP3A4. This will result in reduced clearance of the compound and increased plasma concentrations. In some embodiments, the reduced clearance and higher plasma concentrations result in a lower efficacious dose of compound disclosed herein.

Example A: In Vitro Assay (SARS-CoV-2 M^{pro} Enzymatic Assay)

The C-His6-tagged SARS-CoV-2 MPRO (NC_045512) was cloned, expressed in *E. coli*, and purified by WuXi. The substrate of Dabcyl-KTSAVLQIISGFRKME-(Edans) was synthesized by Genscript. The assay buffer contained 20 mM of Tris-HCl (pH=7.3), 100 mM of NaCl, 1 mM of EDTA, 5 mM of TCEP and 0.1% BSA. The final concentrations of the Mpro protein and substrate were 25 nM and M, respectively, in the MPRO enzymatic assay. Reference compound GC376 was provided by WuXi AppTec and was included in each plate to ensure assay robustness. Test compounds were tested at single dose or 10 doses titration, in duplicate. Compounds were added to an assay plate (384w format) using ECHO, in duplicate wells. The final concentration is 10 μM for the single dose experiment. As for the full dose response experiment, samples were 3-fold serially diluted starting from 25 μM for 10 doses and added to an assay plate, in duplicate wells. The final concentrations (M) of each compound was 25, 8.33, 2.778, 0.926, 0.309, 0.103, 0.034, 0.011, 0.0038, and 0.0013. MPRO protein (25 μL, 30 nM) was added to an assay plate containing test compounds using a Multidrop. The test compound and MPRO protein were pre-incubated at RT for 30 min. Then, substrate (5 μL, 150 μM) was added to an assay plate. For 100% inhibition controls (HPE, high percent effect), 1 μM of GC376 was added. For no inhibition controls (ZPE, zero percent effect), the same volume of DMSO was added. The final DMSO concentration was 1%. Each activity testing point had a relevant background control without the enzyme to remove the fluorescence interference of the compound. After 60 min incubation at 30° C., the fluorescence signal

(RFU) was detected using a microplate reader M2e (SpectraMax) at Ex/Em=340 nm/490 nm.

The inhibition activity was calculated using the formula below, IC₅₀ values were calculated using the Inhibition % data.

$$\text{Inhibition \%} = \frac{((\text{CPD}-\text{BGHPE})-(\text{ZPE}-\text{BGZPE}))}{((\text{HPE}-\text{BGHPE})-(\text{ZPE}-\text{BGZPE}))} \times 100$$

where, HPE is high percent effect controls (1 μM of GC376+enzyme+substrate); ZPE is zero percent effective controls (enzyme+substrate, no compound); CPD is compound activity testing wells (compound+enzyme+substrate; and BG is background control wells (no enzyme).

IC₅₀ values of compounds were calculated with the GraphPad Prism software using the nonlinear regression model of log(inhibitor) vs. response-variable slope (four parameters). Representative biochemical data is presented in Table 2.

Example B: In Vitro Antiviral Cell-Based Assay (Live SARS-CoV-2)

CellTiter-Glo® Luminescent Assay for Determination of CC₅₀ of Each Compound in Cell Cultures:

Multiple cell lines can be used depending on customer's request. For each cell line, 4×10⁴ cells/well in a 96-well plate are incubated with 7 concentrations (depending on its water solubility and using 2-fold dilution) in triplicate of the

individual compound for 24 h, 48 h, 72 h, respectively. After that, addition of substrate for cell viability will be performed, followed by luminance detection 10 min later. The 50% cytotoxic concentrations (CC₅₀) of the antiviral agents will be calculated by SigmaPlot (Systat Software Inc., San Jose, Calif., USA) in an Excel add-in ED50V10.

SARS-CoV-2 Viral Load Reduction Assay:

Multiple cell lines can be used depending on customer's request. Also, different variants of concern (e.g. alpha, gamma, kappa, and delta etc.) can be included according to the customer's request. For each cell line, cells will be infected by 0.1 MOI SARS-CoV-2 for 1 h. After that, the infectious inoculum will be replaced with drug-containing medium which is serial-diluted (7 concentrations). The culture supernatants of the SARS-CoV-2-infected cells are harvested at 48 h post-inoculation (hpi) for qRT-PCR analysis of viral RNA load. A total of 140 μL of culture supernatant will be lysed with 560 μL of AVL buffer, which is subsequently extracted for total RNA with the QIAamp viral RNA mini kit (Qiagen, Hilden, Germany). qRT-PCR will be used for quantitation of SARS-CoV-2 replication using the QuantiNova Probe RT-PCR kit (Qiagen) with a LightCycler 480 Real-Time PCR System (Roche). Each 20 μL reaction mixture is 10 μL of 2× QuantiNova Probe RT-PCR Master Mix, 1.2 μL of RNase-free water, 0.2 μL of QuantiNova Probe RT-Mix, 1.6 μL each of 10 M forward and reverse primer, 0.4 μL of M probe, and 5 μL of extracted RNA as the template. Reactions will be incubated at 45° C. for 10 min for reverse transcription, 95° C. for 5 min for denaturation, follow by 45 cycles of 95° C. for 5 s and 55° C. for 30 s. Signal detection and measurement are taken in each cycle after the annealing step. The cycling profile end with a cooling step at 40° C. for 30 s. The primers and probe sequences are against the RNA-dependent RNA polymerase/helicase (RdRP/Hel) gene region of SARS-CoV-2: Forward primer: 5'-CGCATAACAGTCTTRCAGGCT-3'; Reverse primer: 5'-GTGTGATGTTGAWATGACATGGTC-3'; specific probe: 5'-FAM TTAAGATGTGGTGCTTGCAT-ACGTAGAC-IABkFQ-3'.

Plaque Reduction Assay

Different variants of concern of SARS-CoV-2 (e.g. alpha, gamma, delta, and kappa etc.) can be included according to the customer's request. VeroE6 cells will be seeded at 2×10⁵ cells/well in 24-well tissue culture plates on the day before carrying out the assay. After 24 h of incubation, 50 plaque-forming units (PFU) of SARS-CoV-2 will be added to the cell monolayer and the plates are further incubated for 1 h at 37° C. in 5% CO₂ before removal of unbound viral particles by aspiration of the media and washing once with DMEM. Monolayers are then overlaid with media containing 1.5% low melting agarose (Cambrex Corporation, East Rutherford, N.J., USA) in DMEM and appropriate concentrations of individual compound (5 concentrations), inverted and incubated as above for another 72 h. The wells are then fixed with 10% formaldehyde (BDH, Merck, Darmstadt, Germany) overnight. After removal of the agarose plugs, the monolayers are stained with 0.7% crystal violet (BDH, Merck) and the plaques counted. The percentage of plaque inhibition relative to the control (i.e., without the addition of

193

compound) wells will be determined for each antiviral agent concentration. EC50 was calculated using a sigma plot (SPSS) in an Excel add-in ED50V10. The plaque reduction assay experiments are performed in triplicate.
