AMINE-BASED COMPOUND AND ORGANIC LIGHT-EMITTING DEVICE INCLUDING THE SAME

CROSS-REFERENCE TO RELATED APPLICATION

This application claims priority to and the benefit of Korean Patent Application No. 10-2017-0015690, filed on Feb. 3, 2017, in the Korean Intellectual Property Office, the entire content of which is incorporated herein by reference.

BACKGROUND

1. Field

One or more embodiments relate to an amine-based compound and an organic light-emitting device including the same.

2. Description of the Related Art

Organic light-emitting devices are self-emission devices that produce full-color images, and also have wide viewing angles, high contrast ratios, short response times, and excellent characteristics in terms of brightness, driving voltage, and response speed, as compared to other devices in the art.

The organic light-emitting device may include a first electrode disposed on a substrate, and a hole transport region, an emission layer, an electron transport region, and a second electrode, which are sequentially disposed on the first electrode. Holes provided from the first electrode may move toward the emission layer through the hole transport region, and electrons provided from the second electrode may move toward the emission layer through the electron transport region. Carriers, such as holes and electrons, recombine in the emission layer to produce excitons. These excitons transit (or transition) from an excited state to a ground state, thereby generating light.

The amine-based compound has a structure in which benzene is further condensed at a set (e.g., specific) position of the fluorene and an amine group is not directly linked (e.g., directly chemically bonded) to a benzofluorene core. Due to the inclusion of a linker, a highest occupied molecular orbital (HOMO) energy level is reduced. Thus, when the amine-based compound is used as a hole transport material, an energy level barrier for an emission layer or an additional hole transport layer is reduced, thereby obtaining an effect of a long lifespan.

Therefore, an electronic device (for example, an organic light-emitting device) including the amine-based compound may have a low driving voltage, high current density, and high efficiency.

(1) Synthesis of Intermediate 3-3

10 g of methyl 5-bromo-2-iodobenzoate (3-1) and 5 g of a naphthalene-1-boronic acid (3-2) were diluted with 100 mL of tetrahydrofuran (THF) and 25 mL of water, and 1 g of $Pd(PPh_3)_4$ and 12 g of K_2CO_3 were added thereto dropwise. The reaction vessel was stirred under reflux at a temperature of 65° C. for 6 hours. The reaction vessel was cooled to room temperature and THF was removed therefrom under reduced pressure. Then, an extraction process was performed thereon three times by using ethyl acetate. The resultant was dried by using magnesium sulfate and filtered under reduced pressure. The residue obtained therefrom was purified in substantially the same manner as used to synthesize Intermediate 3-6 to be described below to obtain 8.3 g (83%) of Intermediate 3-3. The obtained compound was identified by LC-MS. $C_{18}H_{13}BrO_2$: M+ 342.2

Example

Comparative Example 1

As an anode, a Corning 15 Ω/cm^2 (1,200 Å) ITO glass substrate was cut to a size of 50 mm×50 mm×0.7 mm, sonicated with isopropyl alcohol and pure water each for 5 minutes, and then cleaned by irradiation of ultraviolet rays and ozone for 30 minutes. Then, the resultant glass substrate was provided to a vacuum deposition apparatus.

2-TNATA was vacuum-deposited on the ITO glass substrate to form a hole injection layer having a thickness of 600 Å, and 4,4'-bis[N-(1-naphthyl)-N-phenylamino]biphenyl (NPB), a hole transport compound, was vacuum-deposited on the hole injection layer to form a hole transport layer having a thickness of 300 Å.

9,10-di(naphthalene-2-yl)anthracene (DNA), a blue fluorescent host, and 4,4'-bis[2-(4-(N,N-diphenylamino)phenyl)vinyl]biphenyl (DPAVBi), a blue fluorescent dopant, were co-deposited on the hole transport layer at a weight ratio of 98:2 to form an emission layer having a thickness of 300 Å.

Evaluation Example

The driving voltage, efficiency, and color purity of the organic light-emitting devices manufactured according to Examples 1 to 11 and Comparative Examples 1 to 3 were measured by using the following methods. Results thereof are shown in Table 2:

Color coordinates: a current-voltage meter (Keithley SMU 236) supplied power and a luminance meter PR650 was used to measure color coordinates.

Luminance: A current-voltage meter (Keithley SMU 236) supplied power and a luminance meter PR650 was used to measure luminance.

Efficiency: A current-voltage meter (Keithley SMU 236) supplied power and a luminance meter PR650 was used to measure efficiency.

Half lifespan indicates an amount of time (hr) that had elapsed when luminance was 50% of initial luminance (100%) at 10 mA/cm^2.

According to one or more embodiments, an organic light-emitting device including the amine-based compound may have a low driving voltage, high efficiency, high luminance, and a long lifespan.
