S. G. HOUSE

LIQUID FUEL VAPORIZER

STATES PATENT

SAMUEL G. HOUSE, OF MIAMI,

Application filed August 7, 1922. Serial No. 580,354.

To all whom it may concern:

following is a specification.

up or atomizing the liquid or gaseous fuel, thus creating a proper combustion element before it enters the engine cylinders.

30 in the novel combination of elements, conscribed, claimed and illustrated in the accompanying drawings, wherein:

Fig. 2 is a fragmentary plan view of the 40 same;

on line 3—3 of Fig. 2; and

on line 4-4 of Fig. 2.

the numeral 5 designates a conventional car- the valve will be automatically moved to a buretor and 6 the intake manifold of an in-position where the port 14 will register with ternal combustion engine. These elements the bore 11 to permit the ingress of air into 105 do not enter in the invention per se, but the device, entering in such manner as to

resisting metal and of the same configura-Be it known that I, Samuel G. House, a tion as the flanges 7 upon the ends of the citizen of the United States, and a resident intake manifold 6 and the outlet of the carof Miami, in the county of Dade and State buretor 5 and is provided with a central 5 of Florida, have invented a new and useful opening 9. This opening 9 is formed with 60 Liquid-Fuel Vaporizer, and of which the a groove or channel 10 upon one of its side walls, which is disposed eccentrically with My invention relates to automatic liquid respect to the opening 9 and communicates fuel or gas vaporizer for internal combus- with a bore or air inlet 11 extending trans-10 tion engines and its principal object is to versely through this plate or casting and 65 provide an automatic device for breaking opens upon one side thereof, as shown in Fig. 3.

A circular valve 12 is provided for controlling this inlet 11 and is pivoted to the A further object of the invention is to proplate or casting 8 by a set screw 13, the valve 70 vide an automatic vaporizer creating a vor- being provided with an elongated opening tex for use on internal combustion engines, 14 for registration with the bore or air inwhich will automatically conduct unvapor- let 11. An arm 15 extends rearwardly from ized liquid fuel to a point where it will in- the valve 12 and is provided with a longi-20 termingle with air and again carried tudinal slot 16. Plates or castings 17 and 75 through the vaporizer to insure thorough 17^A, the latter nearest the manifold, are disvaporization or atomizing of the mixture. posed upon the opposite faces of the plate or My invention also contemplates a device casting 8 and secured thereto by screws or of this character having an additional air other fastenings 18. Shims or washers 19 25 inlet automatically controlled by a valve are interposed between the opposed faces or 80 operatively connected with the carburetor plates or casting 8 and the plates or castings 17 and 17^A; the opening in 17^A being some-With the preceding and other objects and what smaller than the opening in 17. This advantages in mind, the invention consists affords a rim for the entire center chamber, causing the vortex to complete continuous 85 struction and arrangement of parts and op- circuit for the entire center chamber before erations to be hereinafter more fully de- emitting the thoroughly mixed contents into the motor.

An atomizing element or reticulated sheet Figure 1 is a side elevation of the device 20 of extremely fine mesh is stretched across 90 arranged between the intake manifold and the plate 17^A and extends entirely across the the carburetor of an internal combustion opening 9 in the plate or casting 8, the edges of this sheet 20 being held in a circumferential groove 21 in the inner face of the plate 17^A. Bolt receiving openings 22 are 95 Fig. 3 is a vertical sectional view taken provided in the plates or castings 8, 17 and 17^A, which receive bolts 23 to retain the de-Fig. 4 is a vertical sectional view taken vice between the flanges 7.

The operating arm of the carburetor is Referring in detail to the drawings where- designated at 24 and carries a pin 25, which 100 in similar characters of reference designate is operatively engaged in the slot 16 of the similar parts throughout the several views, arm 15, whereby upon actuation of this arm are shown to illustrate the application of create a circular whirl gathering the gas-element with the air into a vortex motion, hav-My invention consists of an elongated ing its outlet at all times from the center 55 plate or casting 8 fashioned from any heat of the vortex through the gauze into the in- 110

aside from thoroughly mixing the air and gas element, serves to wear the gas globules completely out in the course of their contact with the gauze when repeatedly whirled against same by the herein described vortex motion.

From the disclosure it will be obvious that the gas and air passing through the element 10 20 will be broken up or atomized before it enters the intake manifold of the engine. I wish to emphasize the fact that some of the covering said bore, a liquid receiving chamliquid fuel will, without this device, retain ber positioned adjacent to said bore, said its liquid state and in order to atomize the chamber and bore communicating with each 40 15 same, the groove or channel 10 is provided other, an air passage disposed tangentially to catch this liquefied fuel and prevent its to the bore connecting the chamber with properly atomized.

20 give the liquid fuel retained in the groove said chamber to readily vaporize by the or channel a swirl or twiriing motion and whorling vortex motion imparted, a valve or cause it to create a vortex and strike the atomizing element with sufficient velocity to thoroughly vaporize it.

It is to be understood that the form of my invention, herein shown and described, is to

take manifold. This emphasized vortex be taken as a preferred example of the same, and that various changes in the shape, size and arrangement of parts may be resorted to without departing from the spirit of the invention or the scope of the subjoined claim.

Having thus described my invention, what I claim as new and desire to secure and protect by Letters Patent of the United States, is:

A liquid fuel vaporizer comprising a body, a central bore therein, a reticulated element entrance into the intake manifold until the exterior of the body, the shape of the air passage and chamber forcing air which The incoming air through the bore 11 will enters said chamber to cause liquid fuel in 45 pivotally mounted on one face of said vaporizer and an arcuate port in the valve adapted to register with said air passage.

SAMUEL G. HOUSE.
