· · · ·

INVENTOR: Carles R. Eline,

Patented Nov. 18, 1924.

UNITED STATES PATENT OFFICE.

CHARLES R. KLINE, OF READING, PENNSYLVANIA.

COMBINATION ELECTRIC AND COAL BOILER.

Application filed February 14, 1923. Serial No. 618,890.

To all whom it may concern:

the city of Reading, county of Berks, State tion of these instrumentalities as herein of Pennsylvania, have invented a new and shown and described. ⁵ useful Combination Electric and Coal Boiler. of which the following is a specification.

tion of a combined electrically heated and being sectioned vertically to show the col-10 composed of sections held in assembled position by any suitable means, the interior of said sections being heated by a coal grate, Figure 2 represents on an enlarged scale, while the water legs or water spaces of the a section on line 2-2 Figure 1. boiler are provided preferably on each side Figure 3 represents, on an enlarged scale, 65 with electrically heated units or elements, the outer end of the heating unit seen in which are constructed and supported, so as Figure 2, showing the manner of assembling to provide for expansion and contraction the electrical heated unit and its casing, with respect to the boiler sections in a novel within the outer boiler section. manner.

20

organized and that my invention is not limit-Be it known that I. CHARLES R. KLINE, of ed to the precise arrangement and organiza-

Figure 1 represents a perspective view of a sectional electrically heated boiler embody-My invention relates to a novel construc- ing my invention, the front boiler section coal heated boiler, wherein the latter may be location of the electrically heated units with 60 respect to the water spaces or water legs of the boiler.

Figure 4 represents on an enlarged scale 70 It further consists of a novel construction a vertical section on line 4-4 Figure 2,

water spaces provided with electrically heat- end of the casing of the electrical heating ed units, whose outer ends are constructed and insulated in a novel manner, the interior of said sections being provided with a coal grate, whereby either coal or electricity may be employed independently or simultaneously as the heating medium or agent.

It further consists of a novel construction 30 of an electrically heated unit or element and a novel manner of assembling and supporting the same and its adjuncts with respect to the boiler sections to be heated.

It further consists of a novel manner of 35 supporting the ends of the electrically heated unit, whereby the requisite expansion and contraction is permitted and leakage of the water from the outer section of the boiler is prevented.

40 of construction and advantage, all as will be boiler, composed of a series of vertical sechereinafter set forth and pointed out in the tions, which are tied together by side rods,

of a sectional boiler, having the water legs or showing the manner of supporting the inner element.

Figure 5 represents a section on line 5-5 75 Figure 3.

Figure 6 represents a perspective view showing the outer end of a heating element and its adjuncts.

Figure 7 represents a sectional view of 80 the end of one of the electrically heated units showing also an insulating covering door therefor.

Similar numerals of reference indicate corresponding parts.

Referring to the drawings:----

It will be understood that my invention, in its broad aspects, is capable of adaptation to a horizontal or a vertical sectional boiler,.

and in the present instance I have shown the 90 It further consists of other novel features same in conjunction with a vertical sectional

tion, I have shown in the accompanying is customary. In illustrating the adaptation drawings forms thereof which are at pres- of my invention to this type of boiler, I have ent preferred by me, since they will give in shown a sectional boiler 1 as composed of the practice satisfactory and reliable results, al- front section 2, a rear section 3 and the inrious instrumentalities of which my inven- latter may be increased or diminished action consists can be variously arranged and cording to requirements.

the water communication between the sec-For the purpose of illustrating my inventions being effected by means of nipples, as 95 though it is to be understood that the va- termediate sections 4, the number of which 100

5 designates the upright water leg or water jacket at each side of the sections, and the water communication between the various sections is effected by means of the side **5** nipples 6, and the upper series of central nipples 7. Between the water legs 5 is located the combustion chamber 8 having the grate 9 and the ash pit 10:

1,515,954

11 designates horizontally disposed rods, 10 which hold the various sections in assembled position. In adapting the water holding sections, of the conventional type to my heating coil or resistance 19 will at once beinvention, I preferably form on each side come highly heated, and by reason of its pothereof the enlarged water holding chamber sition within the water legs or jackets 5 of 15 12 in each water leg, which is effected by bulging out the outer wall of the section, as indicated at 13, and within this chamber 12 on each side, I locate the heating ele- be at once created. ment or unit 14, which comprises the metal- It will thus be seen that by my invention 20 lic or other casing or tube 15, having its in- I am enabled to heat a sectional boiler of ported upon the V-shaped lug or shelf 17, coal or both simultaneously or independentwhich may be cast upon or secured to the ly and in case of the scarcity of coal, elecinterior of the rear section 3. Within the tricity which is usually available in modern 25 tube 15, I locate the core 18, which is made homes, may be employed solely as the heatof any suitable material and around this ing medium. core, I wind one or more of the resistance By my novel manner of supporting the incoils or electrically heated elements 19. The ner and outer ends of the electrical heating outer end of the tube 15 is closed by the por- units or elements, it is apparent that ample so celain or other non-conducting plug 20, provision is made for expansion or contracsages 21 and 22 therein, which serve as con- the provision of the stuffing box at the front duits for the ends of the conductors and of the front section, provision is made for merge into the vertical passages 23 and 24, 35 respectively, as will be understood from Figure 5. The plug 20 has a tight or driving fit in the outer end of the pipe or casing 15, so that air is excluded from the latter. Above or upon the outer end of the hori-40 zontal pipe 15, I locate the pair of vertical insulating pipes 25 in which are located the terminals 26 and 27 of the conductors or wires which form the heating element so that they will be properly insulated and protected. It will be seen that the inner end of the casing 15, by reason of its manner of support on the V-shaped shelf 17, is free to move slightly longitudinally to provide for expansion and contraction, and in order to so provide for expansion at the outer end of the casing 15, I employ the construction seen in Figures 2 and 3, wherein the outer end of the tube 15 is located in a stuffing box composed of the gland 28 and the pack-55 ing 29, it being apparent that when said gland 28 is tightened, there will be no leakage of water from the front section 2 and, at the same time, there will be provided means for permitting the expansion of the 60 outer end of the tube 15 of the electrically heated element or unit 14. It will be understood that the conductors 26 and 27 are provided with an electric switch or button or controlling device of

any suitable or conventional type, so that 65 the circuit of the resistance coil or coils 19 can be opened and closed, as may be desired. The operation is as follows:---

When it is desired to heat the heater by coal, the latter is supplied to the grate 9 in 70 the usual manner.

In case of a scarcity of coal and it is desired to heat the heater by electricity, it is only necessary to close the circuit, formed by the conductors 26 and 27, whereupon the 75 the boiler, the heat of the electrical elements will be instantly applied to the water in the 80 water legs and an effective circulation will ner end closed as indicated at 16 and sup- the conventional type either by electricity or 85 90 which has the horizontal channels or pas- tion of the heating unit or element, and by 95 permitting expansion outwardly of the heating elements, and, at the same time, preventing any leakage of water from the front sec- 100 tion. The entire boiler is preferably provided with a covering of nonconducting material, the portion of the latter on the front section being indicated at 30, Figure 7, and the out- 105 er ends of the electrical heating elements are insulated by a door 31 provided with a nonconducting lining 32, which may be hinged and locked in position in any suitable manner, as seen in full lines in Figure 7, and in 110 dotted lines in Figure 4. While I have but one electrical heating element in each water leg, it will be apparent that more may be employed and they may be located higher or lower in the water legs, as may be desired. 115 It will be understood that the casing 15 containing the heating element is completely immersed in or surrounded by water, as will be understood from Figure 2, and that the electric heating element or unit may be in- 120 serted into or removed from the casing according to requirements without disturbing the position of the casing in the boiler, whereby a burnt out unit can be readily removed without emptying the water out of 125 the whole heating system, including the boiler, radiators and pipes common thereto. While I have shown the core of the heating

1,515,954

unit and the outer casing 15, as being cylindrical, it will be apparent that other shapes may be employed.

It will be further understood that the di-5 mensions of the water chamber in which the casing 15 is located, will be enough larger than the outer dimensions of said casing so that a free circulation of the water to be heated will be permitted at all times around 10 the heater casing and within the water legs. Having thus described my invention what I claim as new and desire to secure by Letters Patent, is:---15 ter holding sections, provided with a grate, ing through said nipples, and comprising said sections, and comprising a casing, surrounded by water except at its front end, and containing a core and a resistance coil, a sup-20 port on one of said sections for said casing, front section through which the front of through the front section and movably secured therein, and a tightfitting closure for terminals of said coil. the outer end of said casing. 2. In a device of the character stated, wa-25 an electrical heating element positioned in joined by laterally disposed nipples, in such said sections, and comprising a casing, sur- a manner as to permit the free circulation rounded by water except at its front end, and of water in and through the chamber so containing a core and a resistance coil, a sup- formed, an electric heating element passing the outer end of the latter protruding outer casing containing a resistance coil, a through the front section and movably se- trough shaped shelf on the interior of said cured therein, and a tight fitting closure for rear section and supporting the inner end 35 the outer end of said casing, in combination of said casing, a stuffing box in said front of said casing. 3. In a device of the character stated, wa- casing and a protecting casing for the terter holding sections, provided with a grate, minals of said coil, in combination with an 40 an electrical heating element enclosed in a insulated door for closing the front end of casing immersed in water, positioned in said the electric heating element. sections, and comprising a casing closed at 7. In a device of the character stated, an its inner end, and containing a core and a electric heating element, comprising a meresistance coil, an internal support on one tallic tube closed at one end, and having a 45 of said sections, receiving the inner end of tight fitting non-conducting plug at the holding section, through which the outer end tical channels, a core in said tube, a resistof said casing protrudes, a closure for the ance coil on said core, the terminals of said outer end of said casing having passages coil being contained in said channels and therein for the ends of the resistance coil and upright pipes on said tube made of insulatpipes on the outer end of said casing com- ing material through which said terminals 115 posed of insulating material, through which pass. the terminals of said resistance coil pass. 8. In apparatus of the character stated, 4. In a device of the character stated, the combination of a compartment contain-55 water holding sections, provided with a ing liquid the temperature of which congrate, an electrical heating element posi- ventionally is raised by combustion, with an 120 tioned in said sections, and comprising a electrical heating element the major portion casing immersed in water, closed at its inner of which is immersed in said liquid for diend, and containing a core and a resistance rect heating thereof, whereby the two ele-60 coil, an internal support on one of said sec- ments of heat may be selectively and indetions, receiving the inner end of said cas- pendently employed with substantially 125 ing, a stuffing box in the outer water hold- equal temperature raising results. ing section, through which the outer end of 9. In apparatus of the character stated the said casing protrudes, a closure for the outer combination of a compartment containing

end of said casing having passages therein 65 for the ends of the resistance coil and pipes on the outer end of said casing made of insulating material, through which the terminals of said resistance coil pass, in combination with an insulating door, covering 70 the end of said heating element. 5. In a device of the character stated, a sectional boiler composed of front and rear and intermediate sections having water legs, joined by laterally disposed nipples, in 75 such a manner as to permit the free circulation of water in and through the chamber 1. In a device of the character stated, wa- so formed, an electric heating element passan electrical heating element positioned in an outer casing containing a resistance coil, 80 a trough shaped shelf on the interior of said front section and supporting the inner end of said casing, a stuffing box in said the outer end of the latter protruding said casing passes, a closure for the front of 85 said casing and a protecting casing for the 6. In a device of the character stated, a sectional boiler composed of front and rear ter holding sections, provided with a grate, and intermediate sections having water legs, 90 port on one of said sections for said casing, through said nipples, and comprising an 95 with a gland and packing for the outer end section through which the front of said cas- 100 ing passes, a closure for the front of said 105 said casing, a stuffing box in the outer water other end provided with horizontal and ver- 110
