MICHEL EDOUARD JEAN ANTOINE CUYPERS, OF LONDON, ENGLAND. BUILDING FORMED OF FRAMES, SECTIONS, OR ELEMENTS.

Application filed July 18, 1923. Serial No. 652,309.

To all whom it may concern: Be it known that I, MICHEL EDOUARD JEAN ANTOINE CUYPERS, of 88 North End 5 of the Queen of the Netherlands, have in- posts f are positioned on the selected lines cments in Buildings Formed of Frames, Sections, or Elements, of which the following is a specification. This invention relates to buildings in 10 which the walls are formed of standardized panels or elements. The object of this invention is to provide improved panels or elements of the 15 simplest nature that will give the necessary rigidity and durability and that will, at the same time, enable the walls of the buildings to conform to a standardized plan system and to be effectively erected on an improved 20 foundation with a minimum of labour and

necessarily be 5 by 4, and in some cases the rectangles may be squares. The walls are constructed of a combina-Road, London, N. W. 11, England, a subject tion of posts and elements or panels. The 60 vented certain new and useful Improve- of the plan at the occurrence of every intersecting line a or b, that is at g. The posts f are square in cross section, except for grooves \bar{h} , and are of a width equal to the 65 width of the elements or panels excluding any additional plaster coatings that may be provided as hereinafter described. The panels or elements are of lengths that will fill the distance between the posts f, and are 70therefore of two standard lengths whose ratios are 5 by 4. The panels or elements comprise rectangular wooden frames which form the edges of the panels or elements, and comprise two horizontal members j and two vertical members k. Vertical coating boards l are provided on one side of the frames and horizontal coating boards m are provided on the other side. The horizontal frame members j^{-80} are slightly offset to the vertical members \tilde{k} ring to the accompanying drawings in to permit of the ends of the coating boards on either side extending to the full length of the element or panel, while the side edges of the coating boards which are adjacent to 85the frame members lie flush with the side of the frame members. Thus one side n of each of the frame members j and k is left exposed, the other side o is covered by the ends of coating boards, and each of the 90 edges of the elements are formed by an edge of the frame member together with the ends of the coating boards on one side. The vertical edges of the elements are flat, except for grooves r which register with the 95 grooves h when the elements are placed between the posts f to allow of the insertion of tongue boards. The horizontal edges of the elements are each provided with a longitudinal ridge s formed on the members j 100 flush with the side n. The longitudinal ridges s are square in cross section, and of a width equal to half the thickness of the member j together with the thickness of the coating boards on the side o. 105The elements used for the construction of the external walls of a building may be provided with additional coatings on the external surface. In Fig. 2 of the drawings, the elements are provided with a coating u of 110 roughcast plaster or stucco which is held in position and spaced apart from the adjacent

expense. Buildings made in accordance with this invention are characterized by the features set forth in the following claims, and exem-25 plified by the following description, referwhich,

Fig. 1 is a plan; Fig. 2 is a vertical section taken through 30 the foundation, and part of an outside wall; Fig. 3 is a similar section taken through the foundation and an inside wall; and Fig. 4 is a horizontal section taken on the line 4-4 of Fig. 2.

In the method of construction illustrated 35 in the accompanying drawings, which is one example of an embodiment of this invention, the walls are laid out so as to conform to selected lines of a plan having longitudinal 40 lines a and transverse lines b forming rectangles whose sides are 5 by 4 units in length. The selected lines c, on which the walls are constructed, are drawn heavily for distinction from the remainder. By means 45 of this plan system a variety of plan shapes may be conceived in which the lengths of all the longitudinal walls are multiples of a standard length, the standard length being the length of a longitudinal side of one of 50 the rectangles formed by the lines a and b. Similarly the lengths of all the transverse walls are multiples of the length of a transverse side of one of the rectangles. It is to be understood that the ratio be-55 tween the lengths of the longitudinal and transverse sides of the rectangles need not

1,516,084

coating boards l by suitably disposed wood zontal members forming the four edges of forcing members which strengthen the recvertical members k.

strips so as to leave an air space v. the element, vertical coating boards on one The space between the two board coatings side and horizontal coating boards on the of the elements may be provided with rein- other side of the frame, a longitudinal ridge on the top and bottom edges of the element, 70 tangular frames and to which the coating a face of said longitudinal ridges being flush boards l and m may be secured intermedi- with the side of the element, and being ately of their ends; for instance I may pro-square in cross section and of a width equal vide a central vertical reinforcing member to half the thickness of the rectangular which is positioned mid-way between the frame with its coating boards on either side. 75 3. In a building, walls formed of the com-The foundation of the building is formed bination of elements, each of said elements of a solid concrete bed x on which flooring comprising a rectangular frame having two boards 2 are laid. The edges of the founda- vertical members and two horizontal mem-15 tion are provided with ridges 3 which fit the bers forming the four edges of the element, 80 lower edges of the wall elements forming vertical coating boards on one side and horizontal coating boards on the other side of the frame, and a longitudinal ridge on the top and bottom edges of the element, a the internal walls of the building a longi- face of said longitudinal ridges being flush 85 with the side of the element; and of a post disposed between the vertical edges of adjacent elements. 4. In a building, walls disposed to conform to selected lines of a plan having lon- 90 gitudinal and transverse lines forming rectangles, said walls comprising the combination of posts disposed on the selected lines at the occurrence of each intersecting line; and of an element of standard length filling 95 The height of each of the wall elements is the distance between each two adjacent equal to the distance between the floors of posts, each of said elements comprising a the building; the elements resting on one rectangular frame having two vertical members and two horizontal members forming the four edges of the element, vertical coat- 100 ing boards on one side and horizontal coating boards on the other side of the frame, and a longitudinal ridge on the top and bottom edges of the element, a face of said longitudinal ridges being flush with the side 105 of the element. 5. In a building, walls formed of elements each comprising a rectangular frame having two vertical members and two horizontal members forming the four edges of the ele- 110 ment, vertical coating boards on one side and horizontal coating boards on the other side of the frame, a longitudinal ridge on the top and bottom edges of the element, a face of said longitudinal ridges being flush with the 115 side of the element; and floors carried by joists which enter the walls so that the ends of the joists lie flush with the edges of the longitudinal ridges, and filling pieces completing the spaces between the horizontal 120 edges of the wall elements. $\check{6}$. In a building, walls formed of the combination of elements, each of said elements comprising a rectangular frame having two vertical members and two horizontal mem- 125 bers forming the four edges of the element, vertical coating boards on one side and horizontal coating boards on the other side of the frame, a longitudinal ridge on the top and bottom edges of the element, a face of 130

the external walls so that the ridge s occurs on the inside surface of the wall and rests on the flooring boards 2. At the location of tudinal ridge is formed by means of a wooden member 4 secured to the flooring and which fits the lower edge of the wall element, the longitudinal ridge s resting ", on the flooring boards 2. The sides of the ridges 3 and member 4 which contact with the sides 9 of the longitudinal ridges s indicate the location of the axes of the walls which conform to the lines c of the plan ::0 system.

floor carrying the floor above. Joists 7 car-5.5 rying the upper floors are located between the wall elements, and the spaces left between the wall elements above and below the joists are completed by filling pieces 8. The joists 7 enter the walls to an extent such that their ends coincide with the plan 40axes of the wall; that is the ends of the joists lie flush with the sides 9 of the longitudinal ridges s. When the joists 7 are on the same side of the wall as the longitudinal ridges s, the ridges s contact with the 45joists; but when the joists 7 are on the opposite side of the wall to the ridges s, filling pieces 10 of a height equal to the ridges \overline{s} are interposed between the elements and the 50 joists. What I claim and desire to secure by Letters Patent is;-

1. In a building, an element for forming the walls comprising a rectangular frame

- 55 having two vertical members and two horizontal members forming the four edges of the element, vertical coating boards on one side and horizontal coating boards on the other side of the frame, and a longitudinal 60 ridge on the top and bottom edges of the element, a face of said longitudinal ridges being flush with the side of the element.
- 2. In a building, an element for forming the walls comprising a rectangular frame 65 having two vertical members and two hori-
