UNITED STATES PATENT OFFICE.

FREDERICK D. TRYON, OF NEW YORK, N. Y.

ADJUSTABLE BACK REST FOR BABY CARRIAGES.

Application filed April 22, 1927. Serial No. 185,750.

This invention relates to improvements in baby carriages and more particularly to adjustable back rests for such carriages.

One of the objects of the invention is to provide a back rest for baby carriages consisting of the usual upholstered back cushion hingedly supported at the top thereof by the front wall of the carriage.

Another object of the invention is to provide a back rest of this nature, adapted to be adjusted into a position to permit the child to rest its back thereon and assume a comfortable sitting or partly reclining position.

A further object of the invention is to provide a back rest for baby carriages that may be adjusted from the inside of the carriage, without disturbing the front wall thereof.

Other objects and novel features in construction of my invention will become more apparent as the specification proceeds.

In the drawings forming a part of this specification:

Figure 1 is a perspective view of a baby carriage with my improved back rest embodied therein and

Figure 2 is a fragmental sectional view of the front or head portion of the carriage showing my improved back rest.

Referring to the drawings in detail, 5 indicates a baby carriage provided with a bed flooring 6 providing supporting means for a sectional mattress or cushions 7. To the front wall 8 of the carriage near the top thereof there is hingedly supported an upholstered head and back rest 9, which is normally maintained in the position shown in full lines in Fig. 2. The said back rest may be provided with a backing board 10

to which there is secured a brace 11 normally in a folded position in a pocket 12 in the wall 8. By removing the cushion 7 at the extreme left the rest may be raised up and the cushion is then replaced, the brace is unfolded and the head rest is brought down on the cushion and maintained thereon in the dot and dash position indicated in Fig. 2 by the brace 11.

From the above it will be seen that I have provided a back rest for baby carriages that may be readily adjusted to various positions from the inside of the carriage to allow the child to assume a supine, sitting or reclining position without disturbing the front wall.

From the above it will be seen that I have provided a simple and efficient back rest for baby carriages, that without disturbing the wall to which the said rest is supported, the same may readily be adjusted to various positions so that a child therein may comfortably assume a supine, sitting and reclining position.

Having described my invention what I claim as new and desire to secure by Letters Patent is:

A baby carriage comprising a body, a bedding supporting floor in the body, an inwardly extensible and adjustable back rest hingedly supported on the front wall of the carriage and maintained in normal position thereon by the bedding and a foldable brace on the back rest cooperating with the front wall of the carriage to maintain the said back rest in an inclined position and resting on the bedding when the said back rest is extended.

In testimony whereof I hereunto affix my signature.

FREDERICK D. TRYON.
