UNITED STATES PATENT OFFICE

MESSAGE PROTECTOR

Application filed February 14, 1929. Serial No. 339,929.

This invention relates to what may be termed a message protector, and has for an object to provide a mechanism for grouping symbols to be used on bark checks, code mes-5 sages or other messages or on any communication to indicate its authenticity and accuracy.

Another object of the invention is to provide an improved machine to be used in con-10 nection with checks or other messages, the machine presenting a mechanism wherein an almost indefinite number of combinations may be used to group symbols or numbers to be printed on the check or other message.

A further object is to provide a message protector capable of computing simultane-

to provide a machine to be operated by the hand, the arrangement being such that printgreat number of combinations and thereby present an indication or code message or symbol to be applied to checks or other messages to indicate their accuracy and authen-30 ticity, or to translate a proposed message into cipher and back again.

A further additional object is to provide an improved machine for converting a message into a cipher message and for re-converting the cipher message into the original form of message.

In the accompanying drawings,—

Figure 1 is a perspective view of a message 40 protector disclosing an embodiment of the invention;

Figure 2 is a longitudinal vertical sectional view through Figure 3 approximately on line 2—2;

Figure 3 is a horizontal sectional view through Figure 2 on line 3-3, the same disclosing in top plan the mechanism of the protector shown in Figure 1;

Figure 4 is a transverse sectional view through Figure 2 on line 4-4;

Figure 5 is a transverse sectional view through Figure 2 on line 5-5;

Figure 6 is a sectional view similar to the right-hand part of Figure 5 but showing the parts in a shifted position;

Figure 7 is an enlarged detail fragmentary perspective view of part of one of the chains shown in Figure 3;

Figure 8 is a fragmentary sectional view through Figure 2 approximately on the line 69 8-8; and

Fig. 9 is an illustration of a check.

Referring to the accompanying drawings by numerals 1 indicates a casing enclosing the various mechanism shown in Figures 3 to 8 65 inclusive. This casing is provided with openously the numerical values or equivalent ings 2, 3, 4, 5, 6 and 7, which openings act as symbols of one or more linear functions of a windows through which certain parts of the proposed sequence of numbers, the evalua- mechanism shown in Figure 3 may be viewed. ²⁰ tion being effected with respect to a modulus. As illustrated in Figures 5 and 6 a trans- 70 An additional object, more specifically, is parent member 8 is provided in each window so as to permit an inspection of the wheels arranged beneath the respective windows ing members are provided and positioned while keeping dust and dirt from the interior so that they may be shifted according to a of the casing. As shown in Figure 1, there 75 are disclosed six knobs, namely, knobs 9, 10, 11, 12, 13 and 14. These knobs are connected to suitable shafts hereinafter fully described, whereby the mechanism may be operated by the hand from the exterior of the casing. An 80 opening 15 is provided and acts as an entrance for a check or other article. An opening 16 is provided through which the presser or impact plate 17 moves when the knob 18 is struck or forced downwardly. This action 85 takes place when a number or symbol is to be printed on a check or other article inserted through slot 15. As illustrated particularly in Figure 4, the plate 17 is formed integral with or rigidly secured to the arm 18 pivotal- 90 ly mounted at 19 on casing 1 and normally held in an elevated position by a spring 20. The printing mechanism will be hereinafter fully described and may be of any suitable or desired type. As shown in the drawings, a 95 ribbon 21 (Figure 2) is provided and is adapted to be wound on rollers 22 and 23. The roller 22 has shaft 24 extending to the exterior of the casing 1, as shown in Figure 1, and a suitable knob 25 is connected therewith, 100

at any time. Similarly, a shaft 26 is con- wheel 31 is furthest from knob 9 and actuatnected with roller 23 and is provided with a ing wheel 32 is intermediate the other actuatknob 27 whereby the ribbon may be moved in ing wheels. In regard to shaft 35, the small bon and associated parts simulates rather while the large actuating wheel 32 is interclosely the usual action of an ordinary type- mediate and the medium-sized actuating

writer. wheels or rollers 28, 29 and 30 and the angle arranged in various orders as shown in Fig. 75 of rotation of these wheels depends upon the ure 3, but, if desired, could be arranged in number of the various knobs 9 to 14 and cer- some other order without departing from tain other parts fully described hereinafter. the spirit of the invention. Associated with The printing wheels 28, 29 and 30 carry dif- each of the actuating wheels furthest from 15 ferent numbers or symbols which are adapted their respective knobs 9 to 14 is a lock or 80 to print on the check or other article. As clutch 47. This lock or clutch may consist shown in Figure 3, the printing wheel 28 is merely of a plate 48 having a number of disclosed with the number 68 thereon said spaced pins 49 extending therefrom adapted number facing upwardly, while printing to fit in between certain of the teeth of the 20 wheels 29 and 30 are provided with numbers actuating wheels when the knobs 9 to 14 are 85 40 and 100 respectively. When the presser forced to a position against the casing 1, as plate 17 is actuated all of these numbers shown in Figure 3. This arrangement locks will be simultaneously printed on the check the various shafts 34 to 39 inclusive, so that and a legend will therefore be provided upon they cannot be rotated. In order to rotate any 25 a check which will be, in the present instance, of these shafts the knob connected therewith 29 "1,004,068". On each of the printing wheels must be pulled outwardly a sufficient distance 28 to 30 there are provided numbers "00" to to disengage the clutch 47 from the adjacent "100", but for the lack of space all of these actuating wheel. In order that the printing numbers have not been shown but only a few wheels 28 to 30 inclusive may be caused to in order to illustrate the principle involved. function properly means have been provided 95 These numbers are provided for the reason that they agree with the various mechanisms hereinafter described, and particularly with tudinally as the knob is pulled outwardly. As the toothed or actuating wheels 31, 32 and 33 shown in Figures 5 and 6, the various code 35 upon each of the shafts 34, 35, 36, 37, 38 and wheels 50, 51, 52, 53, 54 and 55 are provided 100 wheel 31 with 303 teeth. The indicating or clusive and all these pawls are rigidly seanswer wheels 40, 41 and 42 should each be cured to a freely rockable shaft 58 journaled 105 provided with 101 teeth. It is to be under in suitable bearings near each end of the scribed with a specific number of teeth, but, pulled outwardly, as shown in Figure 6, the 45 changed, following certain mathematical and swings the pawl from the position shown 110 principles, and the same or other desirable re- in Figure 5 to the position shown in Figure 6. be have been used and it will be understood that ing the abutments 56 of all the other pawls 115 respective tubular shafts 44, 45 and 46 are has been pushed back the next knob or any 120 to telescopically fit into each other, so that in either direction. the answer wheels 40 to 42 inclusive will be Coacting with each of the answer or rearrangement will permit each of the printing wheels 28 to 30 to be independently moved in either direction. As shown in Figure 3, shaft 34 has rigidly secured thereto respective actuating wheels 31 to 33 and these actu-

ating wheels are arranged so that actuating

whereby the roller 22 may be rotated by hand wheel 33 is nearest to the knob 9, actuating a reverse direction. The action of the rib- actuating wheel 33 is furthest from knob 10, 70 wheel 31 is nearest knob 10. The actuating It is aimed to rotate the various printing wheels on the shafts 36 to 39 inclusive are for locking all of the shafts 34 to 39 inclusive except the one which has been moved longi-39. As one example, the actuating wheel 33 with flanges coacting with the stop or extenshould be provided with 101 teeth, the actu-sion 56 of the respective pawls 57. There is ating wheel 32 with 202 and the actuating a pawl 57 for each of the wheels 50 to 55 instood that a specific structure is being de- casing 1. When the knob 9, for instance, is if desired, the number of teeth could be outer edge of the wheel strikes the pawl 57 sults secured. Also, instead of using num- This will result in the movement of the abutbers, letters or other symbols could be used, ment 56 to a position in back of the flange but for the purpose of description numbers of wheel 50, and also will result in positionwhen the printing wheels 28 to 30 are men- to a position in front of the various flanges tioned, numbers, symbols or legends of any so that the knobs, shafts and associated parts kind may be used thereon. As shown in Fig- of all the remaining mechanisms cannnot be ure 4, a shaft 43 is provided on which the moved outwardly. As soon as the knob 9 mounted, said tubular shafts being positioned knob may be pulled outwardly and rotated

properly spaced, as shown in Figure 3. This mainder wheels 40 to 42 inclusive are driving means, as for instance, chains 59, 60 and 61, 125 said chains being continually in mesh respectively with the answer wheels 40, 41 and 42. These chains are supported on suitable idlers 63 and are preferably made endless, as shown in Figure 2. Normally the various actuating 130

wheels 31 to 33 inclusive are out of mesh with so that two numerals will appear in the winthese chains and are only brought into mesh dows or openings 2, 3, 4, 5, 6 and 7 simultanewhen any of the knobs 9 to 14 inclusive are ously. The bank and the person drawing the moved outwardly. It will thus be seen that check are provided with identical code sheets 5 when a knob is moved outwardly the parts and with devices embodying the invention. 70 associated therewith are disengaged from the The person drawing the check will draw the lock 47 and at the same time engage with the same in the usual manner, giving the check a respective chains 59 to 61 inclusive. Each number, date, and indicating thereon the sum of these chains is formed as shown, for in- of money to be paid, and then operate the stance, in Figures 7 and 8. From these fig-machine to secure a code number, which num- 75 ures it will be observed that an ordinary ber is stamped on the check. Where the check chain structure is provided having pins or 65 is drawn, as shown in Fig. 9, the number of projections 62 spaced apart a proper distance the check, the sum in dollars and the date form to receive the teeth of the actuating wheels 31 the means for guiding the drawer of the check to 33 inclusive. If, for instance, knob 9 is in manipulating the device. After the check 80 pulled outwardly and then rotated one revo- has been drawn the drawer takes down the lution the actuating wheel 33 would natural- chart and finds that the number 1 indicates 56 ly rotate one revolution and move its chain on the code wheels 50 to 55 and the numbers forwardly a distance equal to 101 teeth. The 28, 5, 86, 26, 28 represent on the code wheels 20 actuating wheel 40 will rotate through the 51 to 55 the respective numbers 99, 01, 12, 72 85 same angle, as it is of the same size and has and 64. Having ascertained from the chart the same number of teeth. While this is tak- that 1 indicates 56 he disregards the 42¢ of ing place the actuating wheel 32 will per- the check and starts with 1 from the \$128.00 form one complete rotation, but as it has 202 indicated. Knob 9 is pulled outwardly and 25 teeth the chain associated therewith will be moved so that the answer wheel 41 will rotate two revolutions. While these two operations are taking place a third operation will be taking place, namely, actuating wheel 31 30 will rotate one revolution and as it has 303 teeth answer wheel 42 will rotate three times. If knob 9 is not rotated a complete revolution but only a part of a revolution a proportionate action of the various wheels will take 25 place. After knob 9 has been rotated, as desired, it is returned to its former position, as shown in Figure 3, and then knob 10 is pulled outwardly and rotated, as desired. This action is repeated for all of the knobs and then the check or other article is moved into the casing through slot 15. The printing is then done by merely striking the knob 18. The check is then removed and a number will be found thereon agreeing with the combination produced by the various numbers of the knobs 9 to 14 inclusive. This number is really in effect the remainder or answer left over from the various additions, subtractions and other actions performed by the mecha-50 nism described.

When the device is in actual use it may be operated by persons in a bank or by persons anywhere. Where the device is used as a check or safety guard for checks drawn on the check, and third, by the date of the check.
banks one device is necessary for the bank. If any one of these numbers on the check 120 and one for the person drawing the check. were changed the particular knob involved Also, in addition to having identical devices, would be rotated a greater or less number of the bank and the person drawing the check times, and consequently, the final number or should have a code sheet giving arbitrary remainder on the printing wheels would not values to the numbers or symbols on the code be the same. This would indicate to the bank 125 wheels 50 to 55. It will be understood that when they use the same system as the drawer, these code wheels carry numbers similar to that someone had tampered with the check. the numbers on printing wheels 28 to 30, said It will be understood that the drawer uses

rotated until 56 comes opposite window 2, as 90 shown in Figure 3. Knob 9 is then pushed in and knob 10 pulled outwardly and rotated in either direction until the numeral 99 appears opposite the window. Knob 10 is then pushed back and knob 11 pulled out and rotated until 95 the numeral 01 appears opposite the window. Knob 11 and associated parts are returned to their former position and knob 12 pulled out and rotated until the numeral 12 appears opposite the window. Knob 12 is returned and 100 knob 13 pulled outwardly and rotated until the numeral 72 appears opposite the window. Knob 13 is returned and knob 14 pulled outwardly and rotated until the numeral 64 appears opposite the window. In the code 1 105 equals 56 and this 1 is taken from the \$128.00 found on the check. The next two numerals, namely, 28 are used in connection with knob 10. The numeral 5 in the number of the check is then used for knob 11 and this is fol-110 lowed by knob 12, utilizing the number 86 which forms the latter part of the number of the check. The number 26 in the date is utilized for knob 13, while the last two numbers, 28 of the date are utilized for knob 14. 115 It will thus be seen that the number of knobs 9 to 14 is controlled, first, by the number of dollars indicated, second, by the number of the check, and third, by the date of the check. numbers being preferably from 00 to 100. the figures on the check as mentioned, in or-Where numbers are used they are arranged der to secure the proper symbol or legend to

numbers on the check and if the symbol or er's machine, that is, he operates knobs 9 to legend secured on their printing wheels is the 14 inclusive (Figure 1) in the manner alsame as the symbol produced by the drawer ready described, so that the letters X, R, S, 70 the bank is satisfied that the check is authen- M, Y, R, appear in the openings 2, 3, 4, 5, tic. The operation of the device has been de- 6, 7, respectively. Because the sizes of the scribed in respect to checks, as the device is actuating wheel have been chosen according particularly adapted to be used in connection to certain mathematical principles, his mawith checks, but it is to be understood that the device can be used with telegraph messages cisely the sequence which the sender placed either in plain language or in code or on any in his machine. By applying to this sepapers and documents where authenticity and accuracy are necessary. It will, therefore, 15 be understood that when the word "check" is used these other uses are understood.

Where the device is planned to be em-20 it is planned to have as many chains and be varied at will according to certain math- 85 say for illustration, six by six. The twenty- wheels on each shaft. For some purposes six letters of the alphabet (or a greater or only one printing wheel is necessary and one 25 other alphabets are employed) will appear shaft, while in other instances two shafts 90 on the code wheels 50 to 55 inclusive (Fig- or even more than six may be used.
