COLLAR STAY

Filed Dec. 5, 1932

## UNITED STATES PATENT OFFICE

BEN B. MANASTER, OF CHICAGO, ILLINOIS

COLLAR STAY

Application filed December 5, 1932. Serial No. 645,663.

This invention relates to a collar stay designed and constructed for use in connection vention in applied position. with soft shirt collars to hold and retain the wings of a collar in an extended position, and 5 has for its principal object the provision of a novel structure of this character which will be highly efficient in use and economical in manufacture.

Among the several objects of this invention 10 is to provide a collar stay which is adaptable of which are provided upstanding extensions 55 for use on collar wings of various lengths, and which includes a simple and inexpensive structure for bearing the collar engaging member and the means for limiting penetra-15 tion of the penetrating means of the collar stay against portions of the collar wings engaged by the collar engaging member and limiting means whereby the wings will remain in an extended position with the creases 20 and wrinkles or the like removed therefrom.

Other objects will appear hereinafter. The invention consists in the novel combination and arrangement of parts to be hereinafter described and claimed.

The invention will be best understood by reference to the accompanying drawing showing the preferred form of construction, and in which:

Fig. 1 is a perspective view of a collar and 30 necktie showing my collar stay in applied position;

Fig. 2 is a plan view of the collar stay embodying my invention;

Fig. 3 is an enlarged fragmentary sectional 35 detail view of the same; and

Fig. 4 is a plan view of a collar stay embodying my invention illustrating a modified form of construction over the collar stay illustrated in Fig. 2.

Referring to the drawing in which the preferred form of construction of my invention is illustrated, a collar is indicated at 10, and associated with this collar is a necktie 11. This collar and necktie do not constitute a part of my invention, but are illustrated in the opposite end portion bears against the bead 90

drawing for the purpose of showing my in-

This collar 10 includes wings 12 having points 13. The collar also comprises an outer fold 14 and an inner fold or neckband 15 pro- 50 vided by folding the material from which the collar is made on a fold line 16.

My invention as illustrated in Figs. 1 to 3 inclusive includes a cross bar 17 at the ends or humps 18 which are designed and intended to bear against the collar at the fold line 16 or at a point near such fold line. This cross bar may be modified in shape and design without depreciating from the operation and 60 function of my invention, and any well known cross bar now commercially in use may be substituted therefor.

This cross bar 17 further includes parallel portions 19 which may be termed, for con- 65 venience, fingers. The end portions 20 of these fingers preferably project into one end portion of tubular members 21 and are secured therein by any suitable manner, such as, for example, if desired by means of solder 70 22 or the like.

Each end portion 21 of the tubular members has formed thereon a bead 23 for reasons which will hereinafter be apparent. Each tubular member has provided therein a longi- 75 tudinally extending slot 24.

Mounted with an end portion thereof slidably arranged in the tubular member is a leg element 25, and this leg element adjacent one end thereof is formed to provide a projection 80 26 which is adapted to be engaged by the thumb of the hand to facilitate adjusting the leg member relative to the tubular member. This projection 26 operates in the slot 24 and serves the additional function of preventing 85 rotation of the leg member 25 within the tubular member 21. Embracing the tubular member 21 is an expansion spring 27, one end of which engages the projection 26 while the

23 whereby this spring will be placed under tension when the leg member 25 is moved

inwardly within the tube 21.

The end portion 28 of the leg member 25 5 has formed therein a loop 29 terminating into a penetrating point 30, the loop 29 functioning to limit penetration of the penetrating point 30 into the points 13 of the wings 12.

By this structure the distance between the 10 cross bar and the penetrating point 30 may be varied at the will of the user so that the dispensing with the necessity of the manu-15 facturer keeping in stock collar stays which are adaptable for use upon collar wings of a length equivalent to the distance between the collar engaging cross bar and the penetrating points.

It is obvious from the structure herein set forth that if desired the other portion of the cross bar between the extensions or humps 18 may be dispensed with, in which instance each collar stay will consist of the extension or 25 humps 18 together with the leg member 25 and tube 21 and their associated elements.

The structure illustrated in Fig. 4 is substantially the same as that illustrated in Fig. 2, with the exception that the projections 26 30 extend outwardly from the tubular members 21 instead of inwardly as shown in Fig. 2.

In both forms of construction the spring 27 serves to normally project the leg 25 into its extreme extended position, and when the 35 collar stay is applied to the collar, this spring will create a bearing of the extension 18 and the loop 29 against the portions of the collar engaged by these elements, thereby stretching the wings 12 so as to remove creases or 40 wrinkles therefrom and to prevent the points of the wings from curling outwardly or upwardly.

While I have illustrated and described the preferred form of construction for carrying 45 my invention into effect, this is capable of variation and modification without departing from the spirit of the invention. I, therefore, do not wish to be limited to the precise details of construction set forth, but desire to 50 avail myself of such variations and modifications as come within the scope of the appended claims.

Having thus described my invention, what I claim as new and desire to protect by Letters

55 Patent is:

1. A stay for use on collar wings including a leg member comprising sections adjustably connected together whereby to compensate for variation in lengths of the collar wings, 60 means providing said connection, and means for urging said sections into extended position with respect to each other.

2. A stay for use on collar wings including a U-shaped member providing a cross-bar and

justably connected together whereby to compensate for variation in lengths of the collar wings, means providing said connection, and means for urging said sections into extended

position with respect to each other.

3. A stay for use on collar wings including a leg member comprising sections adjustably connected together whereby to compensate for variation in lengths of the collar wings, one of said sections being provided with 75 means for connection with the point of a colcollar stay may be applied to the wings of lar wing, means providing said connection, soft collars of various lengths and thereby and means for urging said sections into extended position with respect to each other.

4. A stay for use on collar wings including 80 a U-shaped member providing a cross bar and leg members each comprising sections adjustably connected together whereby to compensate for variation in lengths of the collar wings, one of said sections being provided 85 with means for connection with the point of a collar wing, means providing said connection, and means for urging said sections into extended position with respect to each other.

5. A stay for use on collar wings including 90 a leg member comprising sections adjustably connected together whereby to compensate for variation in lengths of the collar wings, means providing said connection, means for urging said sections into extended position 95 with respect to each other, and thumb engaging means provided by one of said sections for moving said one of said sections in a retracted position against said urging means.

6. A stay for use on collar wings including 100 a U-shaped member providing a cross bar and leg members each comprising sections adjustably connected together whereby to compensate for variation in lengths of the collar wings, means providing said connection, 105 means for urging said sections into extended position with respect to each other, and thumb engaging means provided by one of said sections for moving said one of said sections in a retracted position against said urg- 110

ing means.

7. A stay for use on collar wings including a leg member comprising sections adjustably connected together whereby to compensate for variation in lengths of the collar wings, 115 one of said sections being provided with means for connection with the point of a collar wing, means providing said connection, means for urging said sections into extended position with respect to each other, and thumb engaging means provided by one of said sections for moving said one of said sections in a retracted position against said urging means.

8. A stay for use on collar wings including a U-shaped member providing a cross bar and leg members each comprising sections adjustably connected together whereby to compensate for variation in lengths of the 65 leg members each comprising sections ad- collar wings, one of said sections being pro-

vided with means for connection with the with means cooperating with the tubular connection, means for urging said sections element from said tubular member and said into extended position with respect to each leg element being provided with collar pene-5 other, and thumb engaging means provided trating means. by one of said sections for moving said one 14. A collar stay comprising a leg portion, of said sections in a retracted position against

said urging means.

9. A collar stay for use on collar wings 10 comprising a substantially U-shaped member lower end of said leg portion, a leg element 75 15 for longitudinal movement in the tubular from said tubular member and said leg ele- 80 20 point of a collar wing.

10. A collar stay for use on collar wings comprising a substantially U-shaped member providing a cross bar with parallelly ex-25 tubular members having connection with the ends of said portions, leg elements mounted for longitudinal movement in the tubular members and having means cooperating with the tubular members to prevent detachment 30 therefrom and said leg members being prosaid leg elements for projecting said leg ele-35 ments in an extended position.

11. A collar stay for use on collar wings comprising a substantially U-shaped member providing a cross bar with parallelly extended portions at opposite ends thereof, tu-40 bular members having connection with the ends of said portions, leg elements mounted for longitudinal movement in the tubular members and having means cooperating with the tubular members to prevent detachment

45 therefrom.

12. A collar stay for use on collar wings comprising a substantially U-shaped member providing a cross bar with parallelly extended portions at opposite ends thereof, tubular 50 members having connection with the ends of said portions, leg elements mounted for longitudinal movement in the tubular members and having means cooperating with the tubular members to prevent detachment there-55 from, and means associated with the tubular members and acting upon said leg elements for projecting said leg elements in an extended position.

13. A collar stay comprising a leg por-60 tion, the upper end of which is being adapted to engage a collar at the fold line thereof, erating with said connecting means to hold a tubular member having connection with said leg members against axial movement the lower end of said leg portion, a leg ele- relative to said connecting means and said

point of a collar wing, means providing said member to prevent detachment of the leg

the upper end of which is being adapted to engage a collar at the fold line thereof, a tubular member having connection with the providing a cross bar with parallelly ex- having a portion thereof slidably arranged tended portions at opposite ends thereof, in the tubular member and provided with tubular members having connection with the means cooperating with the tubular member ends of said portions, leg elements mounted to prevent detachment of the leg element members and having means cooperating with ment being provided with collar penetratthe tubular members to prevent detachment ing means, and means associated with the therefrom and said leg members being pro- tubular member and acting upon said leg vided with means for connection with the element to urge said leg element in an extended position with respect to the tubular 85 member.

15. A collar stay comprising a leg portion, the upper end of which is being adapted tended portions at opposite ends thereof, to engage a collar at the fold line thereof, a tubular member having connection with 90 the lower end of said leg portion, a leg element having a portion thereof slidably arranged in the tubular member and provided with means cooperating with the tubular member to prevent detachment of the leg elevided with means for connection with the ment from said tubular member and said point of a collar wing, and means associated leg element being provided with collar penewith the tubular members and acting upon trating means, and a spring member embracing the tubular member and acting upon the leg element to project said leg element in an extended position with respect to the tubular member.

16. A collar stay for use on collar wings including a leg portion the upper end of which being adapted to engage a collar at the fold line thereof, a tubular member connected to said leg portion and having a longitudinal slot formed therein, a leg element having a portion thereof slidable in the tubular member and provided with a portion projecting through said slot to provide a thumb engaging element and to hold said leg element against rotation relative to said tubular member, and means acting upon 115 said leg element for projecting said leg element in an extended position with respect

to said tubular member.

17. A collar stay for the wings of a soft collar including a collar engaging member, 120 leg members adjustably connected to the collar engaging member and provided with collar penetrating means, means providing said connection between the collar engaging member and said leg members, means coop. 125 ment having a portion thereof slidably ar- collar engaging member, and means for yield-65 ranged in the tubular member and provided ably holding said leg members in projected 130

position relative to said collar engaging means.

18. A collar stay for collar wings comprising in combination a collar engaging member, leg members having collar penetrating means and means for limiting penetration of said penetrating means, means providing adjustable connection between the leg members and collar engaging member, and means for bearing said collar engaging member and said limiting means against portions of the wing engaged by the collar engaging member and the limiting means when said stay is in applied position upon said collar wings.

In testimony whereof, I affix my signature. BEN B. MANASTER.
