(57) **ABSTRACT**

The present disclosure discloses a system and method for establishing a network of nodes and participants for dynamic management of media content rights. The system comprises a plurality of nodes configured to interact with each other in accordance with a defined protocol, and a plurality of instances of a distributed media rights transaction ledger associated with a respective node in a communication network. At least one node associated with a corresponding participant interacts with one of remaining nodes of the plurality of nodes associated with a participant which owns media content and maintains control over enforcement of media content rights associated with the media content. A plurality of media content rights transactions between the plurality of nodes is managed by the plurality of nodes in accordance with the defined protocol and categorized and defined based on the defined protocol in each instance of the distributed media rights transaction ledger.

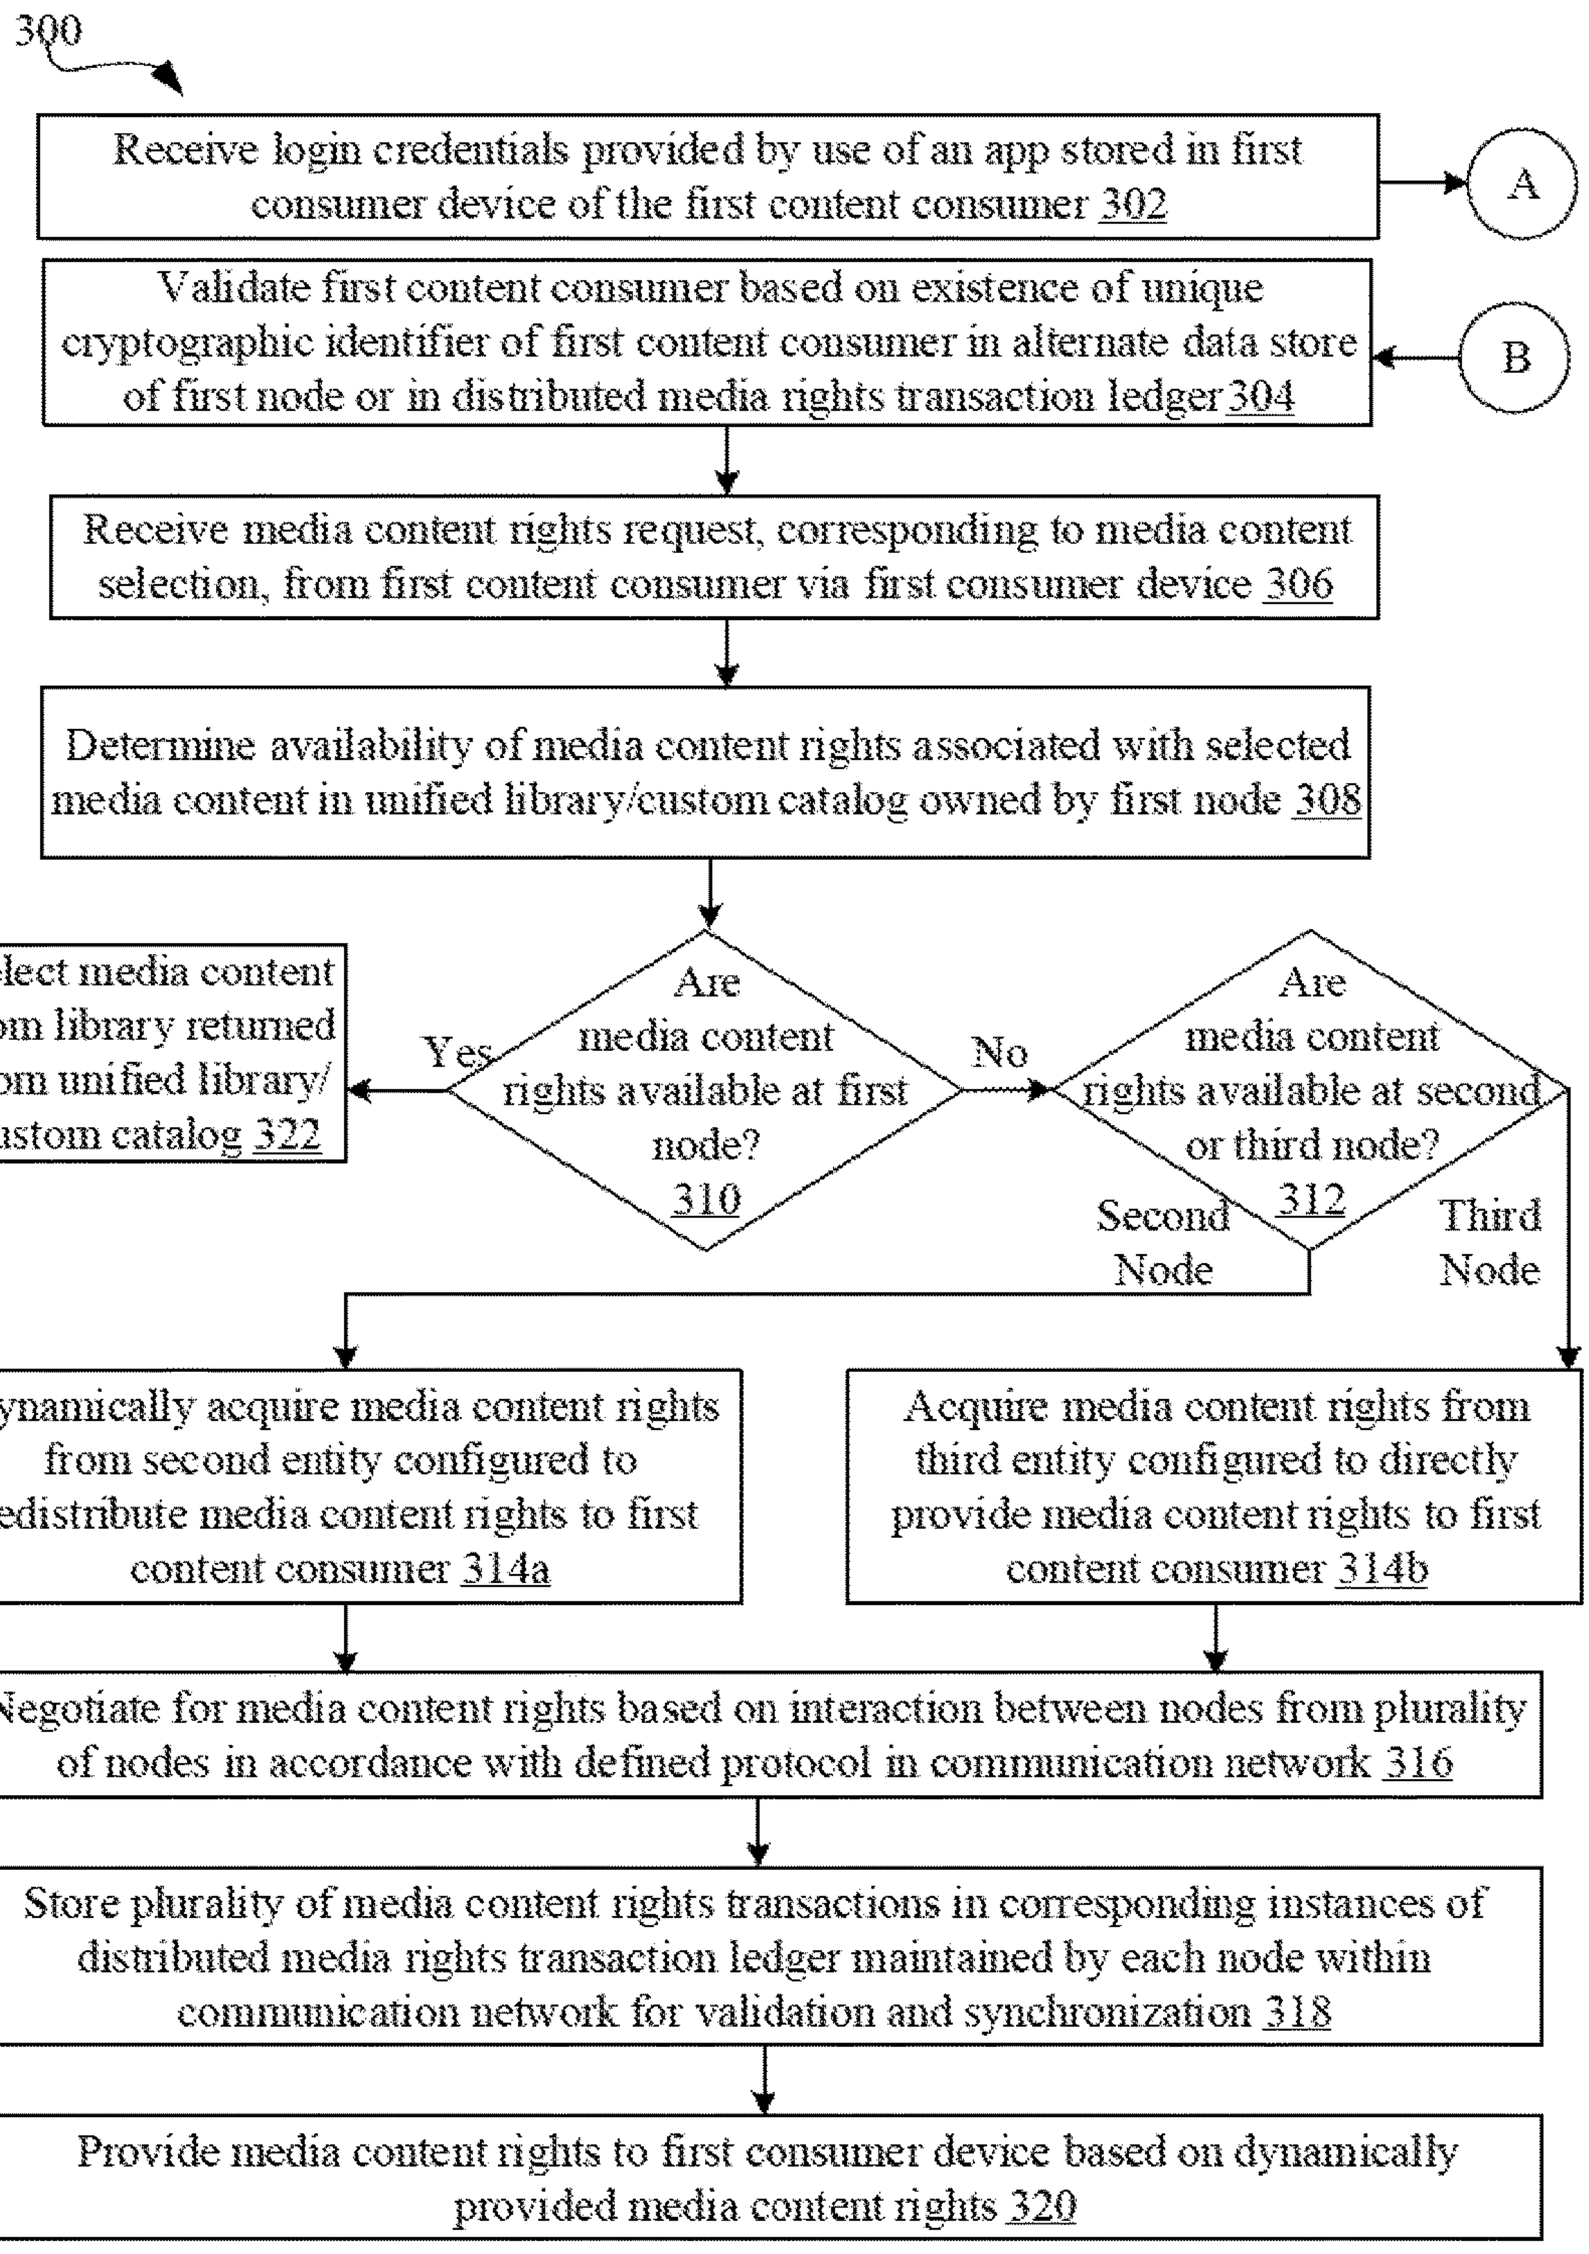
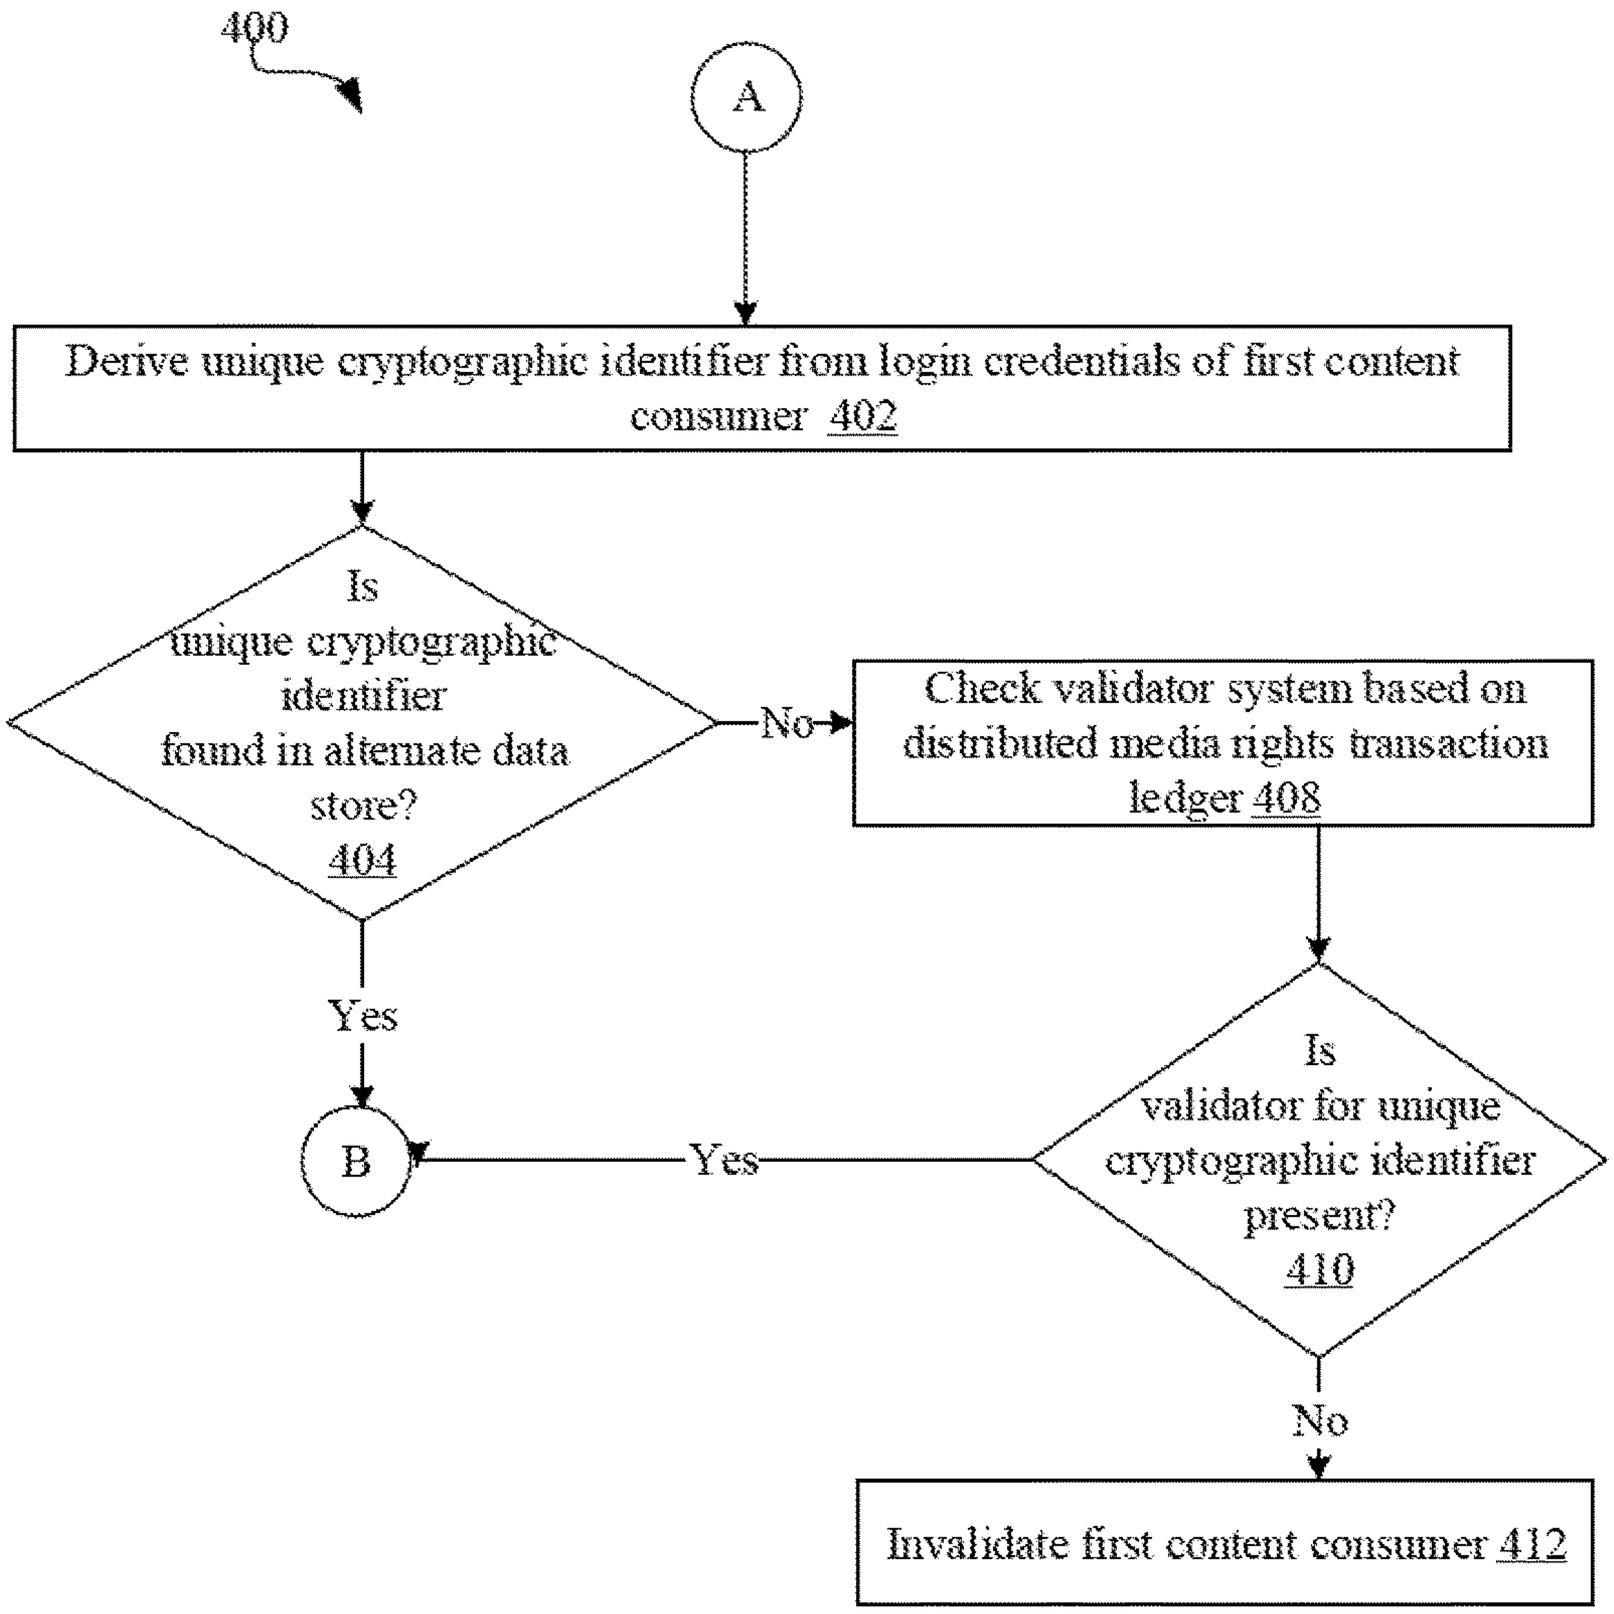
FIG. 2



300
Receive login credentials provided by use of an app stored in first consumer device of the first content consumer 302
A
Validate first content consumer based on existence of unique cryptographic identifier of first content consumer in alternate data store of first node or in distributed media rights transaction ledger 304
B
Receive media content rights request, corresponding to media content selection, from first content consumer via first consumer device 306
Determine availability of media content rights associated with selected media content in unified library/custom catalog owned by first node 308
Are media content rights available at first node? 310
Yes
Select media content from library returned from unified library/ custom catalog 322
No
Are media content rights available at second or third node? 312
Second Node
Third Node
Dynamically acquire media content rights from second entity configured to redistribute media content rights to first content consumer 314a
Acquire media content rights from third entity configured to directly provide media content rights to first content consumer 314b
Negotiate for media content rights based on interaction between nodes from plurality of nodes in accordance with defined protocol in communication network 316
Store plurality of media content rights transactions in corresponding instances of distributed media rights transaction ledger maintained by each node within communication network for validation and synchronization 318
Provide media content rights to first consumer device based on dynamically provided media content rights 320

FIG. 3



400
A
Derive unique cryptographic identifier from login credentials of first content consumer 402
Is unique cryptographic identifier found in alternate data store? 404
No
Check validator system based on distributed media rights transaction ledger 408
Yes
B
Yes
Is validator for unique cryptographic identifier present? 410
No
Invalidate first content consumer 412

FIG. 5

SYSTEM TO ESTABLISH A NETWORK OF NODES AND PARTICIPANTS FOR DYNAMIC MANAGEMENT OF MEDIA CONTENT RIGHTS

CROSS-REFERENCE TO RELATED APPLICATIONS/INCORPORATION BY REFERENCE

[0001] This patent application makes reference to, and claims priority to U.S. Provisional Application Ser. No. 62/616,216, filed on Jan. 11, 2018.

[0002] The above-referenced patent application is hereby incorporated herein by reference in its entirety.

FIELD OF TECHNOLOGY

[0003] Certain embodiments of the disclosure relate to a media content rights management system for digital media and television content. More specifically, certain embodiments of the disclosure relate to a dynamic acquisition, re-distribution, enforcement, and tracking of media content rights using a distributed media rights transaction ledger.

BACKGROUND

[0004] Advancements in the field of digital media industry, digital media content rights management, and television and broadcasting sector have led to development of various technologies and broadcasting platforms that are revolutionizing the way consumer devices access and consume media content. Usually, broadcasting platforms refer to the types of networks that are used to deliver the media content to the consumers. Currently, all the broadcasting platforms, such as analog terrestrial broadcast, digital terrestrial broadcast, direct-to-home satellite broadcast, cable, Internet Protocol (IP), and over-the-top television (OTT), compete and strive to increase their appeal in order to gain wider audience.

[0005] The television viewing market is no longer exclusively concerned with whether media content services are viewed on a dedicated television or another device capable of playing media content. As a result of penetration of new technologies in the television and broadcasting sector, it is evident that the future success of television broadcasting will be dependent on the ability of a network provider to simplify access to the content that consumers demand.

[0006] Increased competition has led the broadcast providers, the media content owners, and the media content re-distributors to handle multiple channels, associated media content rights, and modes of delivery at the same time, which in turn have added unparalleled levels of complexity. This requires installation of large infrastructures and resources to maintain uninterrupted content delivery for existing channel and also meet the ever-increasing demand of new channels.

[0007] Currently, clearance and negotiations of media content rights are very time consuming and backed by readily inaccessible/unusable data. Further, multiple content libraries by various entities, require separate subscriptions and make it difficult for users to navigate to content of their choice freely without having individual subscription. From content consumer's perspective, there are multiple content libraries available from different service providers that are increasing in number day-by-day, thereby making it difficult for the content consumers to add and manage different subscriptions to consume the content of their choice. Furthermore, third-party measurement of viewership of a media content may be costly, myopic, and often not available for all platforms. There is no mechanism to precisely track media content rights and royalties for various entities. Further, isolated media content catalogs and third-party dependencies to estimate viewership for a media content, such as a TV show, to plan for future advertisement inventory needs and obligations, increase complexities. This in turn increases re-work and requires installation of large infrastructures and resources to maintain uninterrupted media content delivery for existing channels and limits the ability of the broadcaster or distributor to change content and/or provide customized content in real time or near-real time.

[0008] Thus, a new and advanced ecosystem may be desirable where all the stakeholders, such as the content owners, the content distributors and re-distributors, gateways, and the end consumers, can functionally interact with each other quickly and securely for acquisition, re-distribution, enforcement, and overall tracking of content rights to provide simplified and customized access to the content that consumers demand.

[0009] Further limitations and disadvantages of conventional and traditional approaches will become apparent to one of skill in the art, through comparison of such systems with some aspects of the present disclosure as set forth in the remainder of the present application with reference to the drawings.

BRIEF SUMMARY OF THE DISCLOSURE

[0010] Systems and/or methods are provided for establishing a network of nodes and participants for dynamic management of media content rights, substantially as shown in and/or described in connection with at least one of the figures, as set forth more completely in the claims.

[0011] These and other advantages, aspects and novel features of the present disclosure, as well as details of an illustrated embodiment thereof, will be more fully understood from the following description and drawings.

BRIEF DESCRIPTION OF SEVERAL VIEWS OF THE DRAWINGS

[0012] FIG. **1** is a block diagram that illustrates an exemplary system for establishing a network of nodes and participants for dynamic management of media content rights, in accordance with an exemplary embodiment of the disclosure.

[0013] FIG. **2** depicts exemplary block diagrams for various systems of a distributed communication network **106** in the ecosystem **100** of FIG. **1**, in accordance with an exemplary embodiment of the disclosure.

[0014] FIG. **3** depicts a flow chart illustrating exemplary operations for establishing a network of nodes and participants for dynamic management of media content rights in the ecosystem **100** of FIG. **1**, in accordance with an exemplary embodiment of the disclosure.

[0015] FIG. **4** depicts a flow chart illustrating exemplary operations for validation of an identity of a content consumer in a communication network of the ecosystem **100** of FIG. **1**, in accordance with an exemplary embodiment of the disclosure.

[0016] FIG. **5** is a conceptual diagram illustrating an example of a hardware implementation for a system employing a processing system for establishing a network of nodes

and participants for dynamic management of media content rights, in accordance with an exemplary embodiment of the disclosure.

DETAILED DESCRIPTION OF THE DISCLOSURE

[0017] Certain embodiments of the disclosure may be found in a method and system for establishing a network of nodes and participants for dynamic management of media content rights. Various embodiments of the disclosure provide a method and system that simplifies and secures the acquisition, re-distribution, enforcement, and tracking of media content rights using a distributed media rights transaction ledger in a cost-effective and seamless manner. Various embodiments of the disclosure provide a mechanism by which all the participants, such as the content owners, distributors, and the content consumers, may functionally interact with each other seamlessly and securely to enable simplified, unified, and customized access to the media content that content consumers demand by simplifying the overall flow of media content rights. The disclosed method and system further provide an ability for dynamic and on-the-fly negotiation of media content rights, contractual obligations, and preparation of custom catalogs to provide new and customized media asset offerings in cost-effective manner and enhanced viewer experience to reinvigorate the digital media and television content broadcasting industry.

[0018] In accordance with various embodiments of the disclosure, a system is provided for establishing a network of nodes and participants for dynamic management of media content rights. In an embodiment, the system may comprise a plurality of nodes configured to interact with each other in accordance with a defined protocol in a communication network. At least one node of the plurality of nodes, associated with a corresponding participant, interacts with one of remaining nodes of the plurality of nodes associated with a participant which owns media content and maintains control over enforcement of media content rights associated with the media content. The at least one node of the plurality of nodes may be configured to manage at least one media content rights transaction of a plurality of media content rights transactions with one or more remaining nodes of the plurality of nodes. The plurality of media content rights transactions may be managed by the plurality of nodes in accordance with the defined protocol in the communication network. The system may further comprise a plurality of instances of a distributed media rights transaction ledger associated with a respective node of the plurality of the nodes. Each instance of the distributed media rights transaction ledger may include the plurality of media content rights transactions categorized and defined based on the defined protocol.

[0019] FIG. **1** is a block diagram that illustrates an exemplary system for establishing a network of nodes and participants for dynamic management of media content rights, in accordance with an exemplary embodiment of the disclosure. Referring to FIG. **1**, there is shown a network of nodes and participants, hereinafter "ecosystem **100**", for dynamic management of media content rights, in accordance with an exemplary embodiment of the disclosure. The ecosystem **100** may comprise a plurality of nodes **102***a*, . . . , **102***n* that are communicatively coupled to each other. There is shown a distributed media rights transaction ledger **104** that remain distributed and synchronized with the plurality of nodes **102***a*, . . . , **102***n*, in a communication network **106**. There is further shown a plurality of participants **108***a*, . . . , **108***n* and **110***a*, . . . , **110***n*, that may be associated with corresponding nodes from the plurality of nodes **102***a*, . . . , **102***n*. One or more nodes from the plurality of nodes **102***a*, . . . , **102***n* may be configured to manage a plurality of media content rights transactions **112***a*, . . . , **112***n* with one or more remaining nodes of the plurality of nodes **102***a*, . . . , **102***n*. The plurality of participants **108***a*, . . . , **108***n* and **110***a*, . . . , **110***n* include a plurality of entities **108***a*, . . . , **108***n* and a plurality of content consumers **110***a*, . . . , **110***n*. There is further shown a plurality of consumer devices **114***a*, . . . , **114***n* associated with respective content consumers of the plurality of content consumers **110***a*, . . . , **110***n*. The distributed communication network **106** may be communicatively coupled to the plurality of content consumers **110***a*, . . . , **110***n* via a network **116**.

[0020] The ecosystem **100** may provide an online platform for creation of a digital marketplace where new media markets, such as a content trading markets, may emerge. Such a digital marketplace for media content rights may then be realized based on a defined protocol or a method which defines a standard for the plurality of nodes **102***a*, . . . , **102***n* to communicatively couple and interact with each other. The defined protocol may be configured to establish a network of the plurality of nodes **102***a*, . . . , **102***n*, and the plurality of participants **108***a*, . . . , **108***n* and **110***a*, . . . , **110***n* upon which media content rights may be acquired, redistributed, constraints enforced, transferred or consumed. Among the plurality of participants **108***a*, . . . , **108***n* and **110***a*, . . . , **110***n* of the ecosystem **100**, a simplified, secured, real-time, and fail-safe tracking of the media content rights is ensured. In accordance with an embodiment, a media content right associated with a media content may be an electronic implementation of a legal contract designed to allow only authorized redistribution of the digital media content and restrict the ways the media content is consumed.

[0021] The plurality of nodes **102***a*, . . . , **102***n* may correspond to a server or a service that may be configured to execute an implementation of the defined protocol for joining the communication network **106**. In accordance with some embodiments, a node of the plurality of nodes **102***a*, . . . , **102***n* may be a software application that includes a set of instructions for defining rules for the programmatic implementation of the defined protocol. In accordance with other embodiments, a node of the plurality of nodes **102***a*, . . . , **102***n* may be a hardware device in which the software application is executed. The hardware device may be owned by an entity, for example, a content owner or a content distributor. The plurality of nodes **102***a*, . . . , **102***n* may be further configured to maintain a copy of the distributed media rights transaction ledger **104** and may create, distribute, execute, and validate media content rights transactions on/from the communication network **106**. In accordance with an embodiment, each node of the plurality of nodes **102***a*, . . . , **102***n* may be further configured to maintain a corresponding instance of the distributed media rights transaction ledger **104** and communicate the corresponding instance of the distributed media rights transaction ledger **104** to the one or more remaining nodes upon request.

[0022] At least one node of the plurality of nodes **102***a*, . . . , **102***n*, such as a second node **102***b*, a third node **102***c*, or a verifier node **102***n*, may be further configured to verify the one or more media content rights transactions of the plural-

ity of media content rights transactions **112***a*, . . . , **112***n* communicated by the one or more remaining nodes of the plurality of nodes **102***a*, . . . , **102***n*. In accordance with an embodiment, the verification may be based on verifying the identity and signature of the sender entity, such as the first entity **108***a* associated with the first node **102***a*.

[0023] In accordance with an embodiment, the at least one node of the plurality of nodes **102***a*, . . . , **102***n*, such as the second node **102***b*, the third node **102***c*, or the verifier node **102***n*, may be further configured to reject a set of invalid media content rights transactions from the one or more media content rights transactions. In accordance with an embodiment, the rejection may be based on the un-verified identity and signature of the sender entity, such as the first entity **108***a* associated with the first node **102***a* and create new media content rights transactions on behalf of at least one of a content consumer, content distributor, or content owner. The new media content rights transactions may be communicated to the one or more remaining nodes.

[0024] In accordance with an embodiment, negotiations for media content rights for media content, for example a media asset, between two or more entities, such as a content distributor or a content owner, include media content rights transactions. Each entity dictates corresponding terms of agreement for the media content. The media content rights transactions may occur in a sequence, forming a sequence of events. In some embodiments, the negotiations for the media content rights may occur in the communication network **106**, where each media content rights transaction may be broadcasted to the entire communication network **106** (i.e., to all the nodes of the plurality of nodes **102***a*, . . . , **102***n* in the communication network **106**). In other embodiments, the negotiations for the media content rights may be done mutually, where two or more nodes respective to each entity may communicate by issuing transactions directly to one another instead of broadcasting media content rights transactions to the entire communication network **106**. In this regard, one or more media content rights transactions may be private media content rights transactions between two entities for which private channels may be created via nodes of the plurality of nodes **102***a*, . . . , **102***n* to communicate the private media content rights transactions between the two entities. This type of media content rights transaction may form a sister collection of media content rights transactions between the two entities. This may prevent excess traffic (distribution and validation of transactions) on the communication network **106** (of other nodes outside of the negotiation) and frees up other nodes to handle core traffic. However, every set of such mutual negotiations ends with one media content rights transaction on the distributed media rights transaction ledger **104** that dictates a contract between two or more entities over media content rights to agreed media content, such as one or more media assets, which may include some or all of the data referenced in the private media content rights transactions in a clear or encrypted form.

[0025] In accordance with an embodiment, at least one node of the plurality of nodes **102***a*, . . . , **102***n* may be further configured to determine (or discover) one or more new nodes which joined the communication network **106** within a defined time period, and communicate information associated with the plurality of nodes **102***a*, . . . , **102***n* to the one or more new nodes. Thus, each node may be further configured to communicate media content rights transactions to other nodes, regardless of whether the media content rights transactions originate with the node or were communicated to it by other nodes. This way, any given media content rights transaction may be disseminated to all nodes on the communication network **106**. The at least one node of the plurality of nodes **102***a*, . . . , **102***n* may be further configured to enforce an adherence of the plurality of nodes **102***a*, . . . , **102***n* to the protocol by refusing or accepting to communicate with the plurality of nodes **102***a*, . . . , **102***n*.

[0026] In accordance with an embodiment, a node of the plurality of nodes **102***a*, . . . , **102***n* may be configured to act as an electronic gateway or a proxy for a consumer device associated with a content consumer to connect with at least one node of the plurality of nodes **102***a*, . . . , **102***n*. In this regard, the node is accessible to consumer devices via an application programming interface (API) which allows the content consumers to interact with the communication network **106**. The entity that belongs to a first node, such as a gateway, and acting on behalf of the content consumer, may acquire media content rights and gather metadata surrounding available media content. The purpose of a node proxying a content consumer, such as one of the plurality of content consumers **110***a*, . . . , **110***n*, to the communication network **106** is to allow rapid scaling of the number of content consumers without the need to scale the count of nodes.

[0027] Such node of the plurality of nodes **102***a*, . . . , **102***n* may be further configured to determine an identity of the content consumer from credentials of the content consumer. In accordance with an embodiment, the identity may be derived from a globally unique cryptographic identifier associated with the content consumer. The node may be further configured to determine that the identity of the content consumer exists in an alternate data store that is created based on at least a corresponding instance of the distributed media rights transaction ledger **104**. The alternate data store may include a set of transactions of the plurality of media content rights transactions **112***a*, . . . , **112***n* that correspond to records of a plurality of content consumers that joins the communication network as new content consumers. The node may be configured to validate the content consumer based on the existence of the identity of the content consumer in the alternate data store.

[0028] In accordance with an embodiment, the at least one node may be further configured to enforce a plurality of constraints associated with the one or more media content rights defined in at least one transaction of the plurality of media content rights transactions **112***a*, . . . , **112***n* for a participant to acquire, distribute, or consume content associated with the one or more media content rights. In accordance with an embodiment, each node may represent at least one participant on the communication network **106** based on signed transactions originated from the node with a cryptographic signature of corresponding participant.

[0029] In accordance with an embodiment, a node of the plurality of nodes **102***a*, . . . , **102***n* may be responsible and configured to communicate corresponding instance of the distributed media rights transaction ledger **104**, to other requesting nodes in the communication network **106**. Accordingly, a new node may be configured to share the same distributed media rights transaction ledger history with any/all other nodes as well, which allows auditing an instance of the distributed media rights transaction ledger **104** associated with corresponding node. In other words, each node may append corresponding media content rights

transactions, as well as media content rights transactions from other nodes in its own instance of the distributed media rights transaction ledger **104**.

[0030] The distributed media rights transaction ledger **104** may correspond to a consensus of replicated, shared, and synchronized digital data, for example the plurality of media content rights transactions **112***a*, . . . , **112***n*, geographically spread across multiple sites, countries, or institutions. The distributed media rights transaction ledger **104** has no central administrator or centralized data storage. Data integrity in the distributed media rights transaction ledger **104** may be secured by consensus across the sites in addition to cryptographic techniques.

[0031] In accordance with an embodiment, the distributed media rights transaction ledger **104** may include records of historical interactions in a time sequence related to flow or movement of media content rights from a content owner to a content distributor, or from a content distributor to another content distributor, or from a content owner or a content distributor to a content consumer in any arbitrary media content right transaction. In some embodiments, in addition to media content rights, the distributed media rights transaction ledger **104** may include records of historical interactions in a time sequence of media consumption by content consumer and related data/analytics, content catalog information, and the like.

[0032] The communication network **106** may correspond to a collection of nodes, such as the plurality of nodes **102***a*, . . . , **102***n*, that interact with one another, perform broadcast media content rights transactions with respect one another, and maintain a copy of the distributed media rights transaction ledger **104** to act as a common store of data. In accordance with various embodiment, the communication network **106** may be a peer-to peer network, a protocol network, a distributed communication network and/or the like. In accordance with other embodiments, the communication network **106** may comprise one or more of a cable television networks, the Internet, a satellite communication network, a wide area network (WAN), a medium area network (MAN), and a local area network (LAN). Although a communication network **106** is shown in FIG. **1**, the disclosure is not limited in this regard; accordingly, other exemplary modes may comprise uni-directional or bi-directional distribution, such as packet-radio or satellite communication.

[0033] The plurality of participants **108***a*, . . . , **108***n* and **110***a*, . . . , **110***n*, may correspond to a group, a collective, an individual, or a company that may operate the plurality of nodes **102***a*, . . . , **102***n* on the communication network **106**. A participant of the plurality of participants **108***a*, . . . , **108***n* and **110***a*, . . . , **110***n*, may act as an entity of a plurality of entities **108***a*, . . . , **108***n* or a content consumer of a plurality of content consumers **110***a*, . . . , **110***n*. Each participant of the plurality of participants **108***a*, . . . , **108***n* and **110***a*, . . . , **110***n* may interacts within the communication network **106** by operating at least one node that adheres to the defined protocol within the communication network **106**.

[0034] Each entity of the plurality of entities **108***a*, . . . , **108***n* may be configured to interact with the communication network **106** by operating at least one node on the communication network **106** which adheres to the defined protocol. An entity associated with a node of the plurality of nodes **102***a*, . . . , **102***n* may present metadata of a plurality of content libraries as a unified library. Another entity of the plurality of entities **108***a*, . . . , **108***n* may represent a content owner, a content distributor, or both. From the content owner, one or more media content rights associated with media content may be originated. The content owners may be responsible for issuing licenses for consumption of the media content by the content consumers. All media content, such as the media assets, may have only one content owner in perpetuity. Media content rights to the media content, such as the media assets, may be acquired, and re-distributed in accordance with the permission of the content owner.

[0035] A content distributor of the plurality of entities **108***a*, . . . , **108***n* may acquire media content rights from another content owner or another content distributor and redistribute the acquired media content rights to other content distributors and gateway nodes. In accordance with an embodiment, the content owner may own a given collection of media content rights to be sold and/or distributed to content distributors and/or content consumers. When a content consumer is interacting with the communication network **106** through a node, which belongs to a given entity in the communication network **106**, the content consumer may be considered to be owned by the given entity. Accordingly, the communication network **106** may be secured by ensuring that: a) content consumer transactions adhere to the protocol as enforced by the proxying/gateway node; b) the entity assumes responsibility over transactions requested by the content consumer; and c) another entity may request to validate the identity of a given user from a prior content owner using the distributed media rights transaction ledger **104**. An example of validating an identity of a given content consumer is described in FIG. **4**.

[0036] On the other hand, the content consumer of the plurality of content consumers **110***a*, . . . , **110***n* may be a user or an individual who may acquire media content rights via a gateway on the communication network **106**. Accordingly, the content consumer may execute media content rights to acquire media content licenses to consume the media content. The content consumer may not have the ability to redistribute the acquired media content right. In accordance with an embodiment, the content consumer may require an entity (one of the content owner or the content distributor) that belongs to a node, such as a proxy or a gateway node, to interact with the ecosystem **100** on behalf of the content consumer. Therefore, the content consumer may not be configured to operate any node of the plurality of nodes **102***a*, . . . , **102***n*. The content consumer of the plurality of content consumers **110***a*, . . . , **110***n* may be associated with a corresponding consumer device of the plurality of consumer devices **114***a*, . . . , **114***n*. A given content consumer may be unique across the entire communication network **106**, regardless of which entities the content consumer interacts with or belongs to, based, for example, on a subscription or membership.

[0037] In accordance with an embodiment, an entity, as a content owner and/or a content distributor, may serve as a gateway for the plurality of content consumers **110***a*, . . . , **110***n* and act on the behalf of the plurality of content consumers **110***a*, . . . , **110***n*. Further, the entity may acquire the media content rights to distribute the media content that it does not own to other content distributors and/or content consumers. In such a case, the entity may act on the behalf of the plurality of content consumers **110***a*, . . . , **110***n*. In this regard, when a content consumer is proxied through an

entity to the communication network **106**, the entity may become an owner of the content consumer.

[0038] The plurality of media content rights transactions **112***a*, . . . , **112***n* make up the core unit (or building block) of data that may be recorded into the distributed media rights transaction ledger **104** of the communication network **106**. Each media content rights transaction of the plurality of media content rights transactions **112***a*, . . . , **112***n* may act as a container for exchange of data across nodes among the plurality of nodes **102***a*, . . . , **102***n*. The structure of each media content rights transaction and corresponding data payload may be specified by the defined protocol for a given context, such that the plurality of nodes **102***a*, . . . , **102***n* in the communication network **106** may accept, reject, validate, and parse the plurality of media content rights transactions **112***a*, . . . , **112***n* in a deterministic and non-ambiguous manner.

[0039] Each media content rights transaction of the plurality of media content rights transactions **112***a*, . . . , **112***n* may be created by a node of the plurality of nodes **102***a*, . . . , **102***n*, and recorded into corresponding instance of the distributed media rights transaction ledger **104**. Further, media content rights transaction of the plurality of media content rights transactions **112***a*, . . . , **112***n* may be communicated to other nodes to be rejected and dismissed or validated and recorded into corresponding instances of the distributed media rights transaction ledger **104** maintained at respective nodes of the plurality of nodes **102***a*, . . . , **102***n*. The data traffic created by the plurality of media content rights transactions **112***a*, . . . , **112***n* between the nodes of the plurality of nodes **102***a*, . . . , **102***n* is what defines the ecosystem **100** or the marketplace of media content rights. Each of the plurality of media content rights transactions **112***a*, . . . , **112***n* may be categorized and specified by the defined protocol. Each media content right transaction may include the category of: a) an announcement of a newly created entity; b) an announcement of a newly created content consumer; c) an announcement of newly available media content, such as a media asset; d) an acquisition of media content rights to media content (as a result of negotiations); and e) consumption of the media content by a content consumer.

[0040] In accordance with various embodiments, each of the plurality of media content rights transactions **112***a*, . . . , **112***n* may be configured to define the acquisition and execution of media content rights. Each of the plurality of media content rights transactions **112***a*, . . . , **112***n* may be stored in the distributed media rights transaction ledger **104** to serve as a history of interactions between various entities. Each of the plurality of media content rights transactions **112***a*, . . . , **112***n* must be originated from a node of the plurality of nodes **102***a*, . . . , **102***n*, and must be distributed to all nodes within the communication network **106** for validation and synchronization. Each of the plurality of media content rights transactions **112***a*, . . . , **112***n* may comprise at least one of an originating node's entity's cryptographic signature, a recipient entity's cryptographic identity, and identity of one or more media content rights for a given media content, negotiated terms of one or more media content rights, an identity of a content consumer, and disparate data associated with consumption of media content by a content consumer. Each of the plurality of media content rights transactions **112***a*, . . . , **112***n* may further comprise an encrypted summary of a set of media content rights transactions, one or more cryptographic hashes of historic media content rights transactions from the distributed media rights transaction ledger **104** for linking one media content rights transaction to another, and a cryptographic hash of all data comprising the media content rights transaction. Each of the plurality of media content rights transactions **112***a*, . . . , **112***n* may further comprise a descriptor for the intent of the media content rights transaction, which may further include at least granted media content rights after a negotiation, transferal of a media content right, and intent to begin a negotiation with another entity, grant of a media content right, consumption of media content by a content consumer, and registration of the plurality of participants **108***a*, . . . , **108***n*, and **110***a*, . . . , **110***n*.

[0041] In accordance with an embodiment, in case a media content rights transaction is found to be invalid by most nodes in the communication network **106**, the media content rights transaction may be discarded and not appended to the distributed media rights transaction ledger **104** across all nodes of the plurality of nodes **102***a*, . . . , **102***n*. There may be an exception, where such invalid media content right transactions may be added to the distributed media rights transaction ledger **104**, but remain invalid, to serve as a history of the origin of invalid media content rights transactions. Such a history may serve as a mechanism to audit potential attacks on the communication network **106** during auditing.

[0042] The network **116** may be any kind of network, or a combination of various networks, and it is shown illustrating the communication that may occur between the plurality of consumer devices **114***a*, . . . , **114***n* and the distributed communication network **106**. For example, the communication network **106** may comprise one or more of a cable television networks, the Internet, a satellite communication network, a wide area network (WAN), a medium area network (MAN), and a local area network (LAN). Although the network **116** is shown, the disclosure is not limited in this regard, accordingly, other exemplary modes may comprise uni-directional or bi-directional distribution, such as packet-radio, satellite.

[0043] In operation, a node, such as the first node **102***a*, of the plurality of nodes **102***a*, . . . , **102***n* may be configured to receive login credentials, such as a username and a password, from the plurality of content consumer **110***a*, . . . , **110***n*, via respective consumer devices, such as the plurality of consumer devices **114***a*, . . . , **114***n*. The first node **102***a* may be configured to derive a unique cryptographic identifier, such as a unique string of alphanumeric characters of defined length, from the login credentials of each of the plurality of content consumer **110***a*, . . . , **110***n*. The unique cryptographic identifier may be derived based on, for example a hashing algorithm, defined in the protocol defined in the communication network **106**, and may be stored in the alternate data store **214***a* owned by the first node **102***a*.

[0044] In accordance with an embodiment, at a later time, when the first content consumer **110***a* requests for a desired media content for consumption, by providing corresponding login credentials, the first node **102***a*, for example a streaming media and VOD service provider, may be configured to determine whether the unique cryptographic identifier of the first content consumer **110***a* is found in the alternate data store **214***a* associated with the first node **102***a*. If not found, a validator system, for example another entity representing

a direct broadcast satellite service provider, may be checked based on the distributed media rights transaction ledger **104**. In accordance with an embodiment, a validator may be found for the unique cryptographic identifier of the first content consumer **110***a* using the distributed media rights transaction ledger **104**. The validator may be found in case the validator system may have previously interacted with the first content consumer **110***a*, and corresponding content media rights transaction is stored in the distributed media rights transaction ledger **104**. In an embodiment, the validator is not found for the unique cryptographic identifier of the first content consumer **110***a* using the distributed media rights transaction ledger **104**, the first content consumer **110***a* may be invalidated.

[0045] In accordance with another embodiment, the first node **102***a* may be configured to validate the first content consumer **110***a* based on the existence of the unique cryptographic identifier of the first content consumer **110***a* in the alternate data store **214***a* of the first node **102***a*. Additionally, the presence of the validator may validate the first content consumer **110***a*. Accordingly, the first node **102***a* may be configured to receive media content rights request, corresponding to media content selection, from the first content consumer **110***a*, via the first consumer device **114***a*.

[0046] In accordance with an embodiment, the unified library/custom catalog **214***b* owned by the first node **102***a* may identify, prepare and present media content on-the-fly specifically for the first content consumer **110***a*, based on consumer behavior and consumption pattern of the first content consumer **110***a*, for playback. In accordance with an embodiment, the first content consumer **110***a* may provide a selection of a new media content which is not presented by the unified library/custom catalog **214***b*.

[0047] In accordance with an embodiment, the first node **102***a* may determine whether the media content rights (associated with selected media content) are available in the unified library/custom catalog **214***b* owned by the first node **102***a*. In this regard, it may be determined whether the first content consumer **110***a* or the first entity **108***a* associated with the first node **102***a* have been granted the media content rights associated with the selected media content in the unified library/custom catalog **214***b* owned by the first node **102***a*. In case the media content rights associated with the selected media content are available at the first node **102***a*, the media content may be selected for consumption/execution of the rights from the unified library/custom catalog **214***b* and provided to the first content consumer **110***a* by the first node **102***a*.

[0048] In case the first content consumer **110***a* or the first entity **108***a* associated with the first node **102***a* has not been granted the media content rights associated with the selected media content in the unified library/custom catalog **214***b*, the first node **102***a* may determine whether the media content rights (associated with selected media content) are available for acquisition with the second entity associated with the second node **102***b* or the third entity associated with the third node **102***c*.

[0049] In accordance with an embodiment, the first node **102***a* may be configured to dynamically acquire the media content rights from the second entity associated with a second node **102***b* (that may redistribute the media content rights to the first content consumer **110***a*) by negotiating with the second entity associated with the second node **102***b* that has the media content rights to redistribute. In accordance with another embodiment, the first node **102***a* may be configured to acquire the media content rights from the third entity associated with the third node **102***c* (that may own the media content and may directly provide the media content rights) by negotiating with the third entity associated with the third node **102***c* that owns the media content and associated media content rights.

[0050] Accordingly, the first entity **108***a* associated with the first node **102***a* may be configured to negotiate with the second entity associated with the second node **102***b* or the third entity associated with the third node **102***c*. The negotiation may be performed for acquisition of the media content rights and based on a plurality of interactions between nodes from plurality of nodes **102***a*, . . . , **102***n*, in accordance with defined protocol in the communication network **106**. The plurality of interactions between nodes from plurality of nodes **102***a*, . . . , **102***n* may result in the plurality of media content rights transactions **112***a*, . . . , **112***n* that may be stored in corresponding instances of the distributed media rights transaction ledger **104** maintained by each node of the plurality of nodes **102***a*, . . . , **102***n* within the communication network **106** for validation and synchronization.

[0051] In accordance with an embodiment, each node may cryptographically hash transaction data of each transaction. This hash may then be digitally signed by the media content rights transaction creator with a private key of a private key-public key pair. The public key may then be shared with other nodes whereas the private key is kept as a secret. This allows a node to verify the creator (or the initiator) of the media content rights transaction, and that the media content rights transaction data is not altered according to the hash digitally signed by the creator. Every single media content rights transaction is verified by checking the distributed media rights transaction ledger **104** distributed at the plurality of nodes **102***a*, . . . , **102***n*. Recent validated media content rights transactions may be grouped and cryptographically identified using, for example, but not limited to a hashing algorithm, defined by the protocol. Each group may have a unique cryptographic identifier which is derived from a previous group's final cryptographic identifier, transaction data's cryptographic identifier, and a defined mathematical value. The rules of the protocol may be defined in the genesis group, i.e. the first group. Given the different types of the media content rights transactions, nodes may be configured to derive certain data representing a marketplace, such as the ecosystem **100**. The data that is derivable by each node of the plurality of nodes **102***a*, . . . , **102***n* may include a global catalog of available content items, a per-entity catalog or an entity level catalogs of available content (based on ownership/distribution rights), and a global user consumption of content items. Such data may create the possibility of inferring the value of media content items based on its demand (user consumption) and its supply (availability versus number of content distributors). An entity may then choose to invoke a negotiation with another entity, or entities, to acquire or distribute the media content rights to a media content item. Because the defined protocol dictates the method in which two or more entities may negotiate, negotiations may then occur dynamically and without premeditated action on behalf of any participating entities in the communication network **106**.

[0052] Once the negotiation is successful, the first node **102***a* may be configured to provide the media content rights

acquired from the second node **102***b* or the third node **102***c* to the first consumer device **114***a*. In accordance with an embodiment, the media player of the first consumer device **114***a* may be provided a link of the media content from the media content master repository **222** of the third entity associated with the third node **102***c* to start viewing the media content based on the dynamically acquired rights.

[0053] FIG. **2** depicts exemplary block diagrams for various systems of a distributed communication network **106** in the ecosystem **100** of FIG. **1**, in accordance with an exemplary embodiment of the disclosure. With reference to FIG. **2**, there are shown a gateway system **202**, a content distributor system **204**, a content owner system **206**, and a media assets management system **224**. The gateway system **202** may correspond to the first entity **108***a* associated with the first node **102***a* of the plurality of nodes **102***a* . . . , **102***n* described in FIG. **1**. Similarly, the content distributor system **204** may correspond to the second entity associated with the second node **102***b* of the plurality of nodes **102***a* . . . , **102***n* described in FIG. **1**. Similarly, the content owner system **206** may correspond to the third entity associated with the third node **102***c* of the plurality of nodes **102***a* . . . , **102***n* described in FIG. **1**. The media assets management system **224** may correspond to an arbitrary node of the plurality of nodes **102***a* . . . , **102***n*.

[0054] The gateway system **202** may include a first device **208***a*, an application program **210**, APIs **212**, an alternate data store **214***a*, a unified library/custom catalog **214***b*, and a first instance of distributed media rights transaction ledger **104**. The content distributor system **204** may include a second device **208***b*, the application program **210**, a media content rights repository **216**, a media content repository **218**, and a second instance of distributed media rights transaction ledger **104**. The content owner system **206** may a third device **208***c*, the application program **210**, a media content rights master repository **220**, a media content master repository **222**, and a third instance of distributed media rights transaction ledger **104**. The content owner system **206** is shown to be associated with a digital rights management (DRM) license node **102***m*.

[0055] The media assets management system **224** may include a content rights tracking system **226**, an analytics system **228**, an advertisement management system **230**, a viewer data repository **232**, and an integrated license server **234**. In some embodiments of the disclosure, the content rights tracking system **226**, the analytics system **228**, the advertisement management system **230**, the viewer data repository **232**, and the integrated license server **234** may be integrated to form a single integrated system. In other embodiments of the disclosure, the various systems may be distinct. Other separation and/or combination of the various entities of the exemplary media assets management system **224** illustrated in FIG. **2** may be done without departing from the scope of the disclosure.

[0056] The gateway system **202** may comprise suitable logic, circuitry, and interfaces that may be configured to execute code that is accessible to the plurality of consumer devices **114***a*, . . . , **114***n* via the APIs **212**. The APIs **212** allow content consumers **110***a*, . . . , **110***n* to interact with the plurality of nodes **102***a*, . . . , **102***n* in the communication network **106**, with an entity representing, for example a streaming media and VOD service provider or a direct broadcast satellite service provider, that owns the gateway system **202** acting on behalf of the plurality of consumer devices **114***a*, . . . , **114***n*. The interaction may result in acquisition of media content rights for the plurality of consumer devices **114***a*, . . . , **114***n* to consume media content and gather metadata associated with available media content.

[0057] The first device **208***a* may be owned by the gateway system **202** (or the first node **102***a*) and configured to store the application program **210**, the APIs **212**, and the first instance of distributed media rights transaction ledger **104**. The first device **208***a* may be further configured to store or reference the alternate data store **214***a* and the unified library/custom catalog **214***b*. The alternate data store **214***a* may include a plurality of unique identities which may be represented as a cryptographic value corresponding to each valid content consumer. The alternate data store **214***a* may be created using at least the distributed media rights transaction ledger **104**, in which each new content consumer joining the communication network **106** is recorded as a media content rights transaction. A requesting content consumer is validated in case the identity cryptographic value of the requesting content consumer is found in the alternate data store **214***a* based on a match of the identity hash value with one of the plurality of unique identifiers stored in the alternate data store **214***a* or the first instance of distributed media rights transaction ledger **104**.

[0058] The gateway system **202** may be configured to present metadata of multiple content libraries that may be owned by different entities, for example, different content owners, distributors, re-distributors, VOD service providers, and the like, as the unified library/custom catalog **214***b* for the content consumers **110***a*, . . . , **110***n*, to navigate. In this regard, the unified library/custom catalog **214***b* may correspond to a collection of media content belonging to one or more entities having media content rights available for acquisition, distribution, and/or consumption. Further, the unified library/custom catalog **214***b* may be identified, prepared, and presented on-the-fly specifically for a content consumer, such as the first content consumer **110***a*, based on consumer behavior and consumption pattern of the first content consumer **110***a*, for playback.

[0059] Currently due to isolated content libraries and different subscriber base, a narrow view of content consumers related to media consumption pattern is available. The gateway system **202** may solve this problem by presenting metadata of multiple content libraries as the unified library/custom catalog **214***b*. Based on the communication network **106**, an industry-wide network and ecosystem **100** is created, where an industry-wide single sign-on for the content consumers **110***a*, . . . , **110***n*, may be provided by the gateway system **202** to navigate through an industry-wide shared content library, where media content rights to a media content may be dynamically acquired, distributed, and enforced, by way of media content rights transactions. Thus, previously untapped markets may be identified, and unmonetized media content may be monetized by dynamic provisioning of media content rights to an accepting entity. In accordance with an embodiment, the gateway system **202** may also include the first instance of the distributed media rights transaction ledger **104**, and thus may also function as a node. This node or another node associated with the same entity (e.g., a service provider that controls or owns the gateway system **202**) may be required to update corresponding distributed media rights transaction ledger **104**, in accordance with the media content rights transactions proxied for

each content consumer (i.e., playback of requested media contents, ad plays, content requests, and the like.) Such update may be broadcasted to other connected nodes of the plurality of nodes **102***a*, . . . , **102***n* for synchronization of the recently updated media content rights transaction in the distributed media rights transaction ledger **104** across the plurality of nodes **102***a*, . . . , **102***n*.

[0060] The content distributor system **204** may comprise suitable logic, circuitry, and interfaces that may be configured to execute code to acquire media content rights to distribute the media content that it does not own to other content distributors and/or content consumers. In accordance with an embodiment, the content distributor system **204** may act on content consumer's behalf. In accordance with an embodiment, the content distributor system **204** may also act as a content owner, in tandem. As illustrated in FIG. **2**, the content distributor system **204** may own the second device **208***b* that may be configured to store the application program **210**, the second instance of the distributed media rights transaction ledger **104**, the media content rights repository **216**, and the media content repository **218**.

[0061] The content owner system **206** may comprise suitable logic, circuitry, and interfaces that may be configured to execute code to own a collection of media content rights to be sold/distributed to content distributors, such as the second node **102***b*, and/or content consumers, such as the plurality of content consumers **110***a*, . . . , **110***n*. Such content owners may be further configured to issue licenses to such content consumers for consumption of the media content. As illustrated in FIG. **2**, the content owner system **206** may own the third device **208***c* that may be configured to store the application program **210**, the third instance of the distributed media rights transaction ledger **104**, the media content rights master repository **220**, and the media content master repository **222**. The media content master repository **222** may be a database of media content or media assets that are owned by the content owner system **206**. The media assets may include uncompressed content, live content segments of one or more live feeds of channels, and/or VOD content. Generally, the term "content," "media," "media content," "media assets" and similar words are used interchangeably to refer to any type of media-audio, videos, datacasts, music, text, images, graphics, articles, photos, photo galleries, video galleries, infographics, maps, polls, guest biographies, tweets or other social media, blog posts, and/or the like. The media content rights master repository **220** may be a database of media content rights associated with the media content, available for negotiation. A media content right may be an electronic implementation of a legal contract designed to allow only authorized redistribution of digital media content and restrict the ways the media content is consumed.

[0062] The DRM license node **102***m* may correspond to a DRM license server for media content (that belongs to the content owner system **206**) stored in the media content master repository **222**. Metadata necessary to acquire a license from the DRM license node **102***m* associated with the content owner system **206**, may include, but is not limited to, a distributed media rights transaction ledger identifier representing a media content, a distributed media rights transaction ledger identifier of an entity (that owns for example the gateway system **202**) facilitating the consumption of playback, and a distributed media rights transaction ledger identifier representing a content consumer. Such identifiers may be encrypted and hashed by the entity facilitating the consumption of playback, creating a cryptographic signature which may be used to validate the origin of the request.

[0063] The media assets management system **224** may comprise suitable logic, circuitry, and interfaces that may be configured to execute code for being owned or managed by an entity and may operate at least one node of the plurality of nodes **102***a*, . . . , **102***n*. In some embodiments, the media assets management system **224** may be jointly owned or managed by a group of entities in one country or multiple countries, where each entity operates at least one node of the plurality of nodes **102***a*, . . . , **102***n*. In some embodiments, the media assets management system **224** may be a public and open system, services of which may be partially or completely available to all the nodes of the plurality of nodes **102***a*, . . . , **102***n* in the communication network **106**.

[0064] The content rights tracking system **226** may comprise suitable logic, circuitry, and interfaces that may be configured to execute code for tracking the media content rights or the flow of the media content rights of one or more media assets among various participants of the communication network **106** using the distributed media rights transaction ledger **104** maintained at each node. The content rights tracking system **226** increases operational efficiencies in the digital media and television content processing and digital rights management by allowing on-the-fly tracking of the media content rights or the flow of the media content rights of one or more media assets among various participants of the communication network **106** using the distributed media rights transaction ledger **104**.

[0065] The analytics system **228** may comprise suitable logic, circuitry, and interfaces that may be configured to execute code for identifying (on-the-fly) a custom catalog specifically for a content consumer, such as the first content consumer **110***a*. The analytics system **228** may be further configured to prepare the custom catalog, and make available to the first content consumer **110***a*, via the gateway system **202**. In some embodiments, the analytics system **228** may be configured to communicate the identified custom catalog to a particular node of an entity or a set of nodes of different entities subscribed to services of the analytics system **228**. Thereafter, a scheduler system (not shown) of at least one node may be configured to prepare the custom catalog and make available to the content consumer **110***a*. Similar to the first content consumer **110***a*, based on behavior and consumption pattern of the plurality of content consumers **110***a*, . . . , **110***n*, a custom catalog comprising selected media content, may be identified, prepared, and presented to each of the plurality of content consumers **110***a*, . . . , **110***n* on respective plurality of consumer devices **114***a*, . . . , **114***n* for media consumption.

[0066] The advertisement management system **230** may comprise suitable logic, circuitry, and interfaces that may be configured to execute code for dynamic insertion of pre-encoded VOD assets, or advertisement media, or other promotional media based on real-time data of media consumption of a particular media asset via the gateways system **202**. The real-time data of media consumption may be received when a transaction related to the media consumption of media content is detected for a content consumer. In some embodiments, the advertisement media item (i.e., an ad) may be dynamically inserted at a specified position in the media asset associated with a detected content placement opportunity (CPO). The insertion may be done based on

presence of an inbound trigger, such as society of cable telecommunication engineers (SCTE)-104-based trigger, at the specified position associated with the detected CPO. The manipulation of the catalogs or programming schedules may be driven by real time or near-real time change in user consumption behavior (that governs demand for particular type of content).

[0067] The viewer data repository **232** may comprise suitable logic, circuitry, and interfaces that may be configured to execute code for storing an industry-wide user behavioral data for the digital media and television content industry. The viewer data repository **232** may include individual consumer-based information and aggregate audience-based information. The individual consumer-based information may include parameters, such as favorite media assets, most preferred genre of media assets, most watched TV shows, and other content consumer-specific media preferences. The audience-based parameters may include calculated values derived by processing of media consumption data of a group of content consumers segregated by age, region, and the like. The group of content consumers may be associated with the plurality of consumer devices **114***a*, . . . , **114***n*. By use of the viewer data repository **232**, content development by an entity, such as content owners, may target a known market with precision. The behavioral data of the content consumers may be shared among the entities, such as the content owners and the content distributors, without involvement of any third-party that currently measures viewership data and sells such data to content owners and distributors at a premium/high cost.

[0068] The integrated license server **234** may correspond to an integrated DRM server managed or shared by multiple entities. In some embodiments, content rights of certain media content may be dynamically acquired from the plurality of different content owners using a single integrated license server, such as the integrated license server **234**. In some embodiments, each entity, such as a content owner or a content distributor, may have their own DRM server to provide media content rights. Further in some embodiments, media content rights may be dynamically and automatically generated and provided to the asking entity by the integrated license server **234** based on the agreed parameters in a final media content rights transaction.

[0069] FIG. **3** depicts a flow chart illustrating exemplary operations for establishing a network of nodes and participants for dynamic management of media content rights in the ecosystem **100** of FIG. **1**, in accordance with an exemplary embodiment of the disclosure. With reference to FIG. **3**, there is shown a flowchart **300**. FIG. **4** depicts a flow chart illustrating exemplary operations for validation of an identity of a content consumer in a communication network of the ecosystem **100** of FIG. **1**, in accordance with an exemplary embodiment of the disclosure. With reference to FIG. **4**, there is shown a flowchart **400**.

[0070] At **302**, login credentials provided by use of an app stored in the first consumer device **114***a* of the first content consumer **110***a* may be received. In accordance with an embodiment, a node, such as the first node **102***a*, of the plurality of nodes **102***a*, . . . , **102***n* may be configured to receive login credentials, such as a username and a password, from the content consumer, such as the first content consumer **110***a*, via a consumer device, such as a first consumer device **114***a*. The first consumer device **114***a* may provide the login credentials by use of an app, for example, a mobile app or a TV app, stored in the first content consumer **110***a*.

[0071] In accordance with an embodiment, the first node **102***a* may correspond to the gateway system **202**, such as the streaming media and VOD service provider. In accordance with an embodiment, the request may be received by the node, such as first node **102***a*, that is accessible to the plurality of consumer devices **114***a*, . . . , **114***n*, via the APIs **212**. The APIs **212** may allow the plurality of content consumers **110***a*, . . . , **110***n* to interact with the plurality of nodes **102***a*, . . . , **102***n* in the communication network **106**.

[0072] In accordance with an embodiment, the content consumer such as the first content consumer **110***a*, associated with the first consumer device **114***a*, may be a participant in the communication network **106** but may not be required to operate a node of the plurality of nodes **102***a*, . . . , **102***n*.

[0073] Referring to flowchart **400** in FIG. **4**, at **402**, a unique cryptographic identifier may be derived from the login credentials of the first content consumer **110***a*. In accordance with an embodiment, the first node **102***a* may be configured to derive the unique cryptographic identifier, such as a unique string of alphanumeric characters of defined length, from the login credentials of the first content consumer **110***a* by use of, for example a hashing algorithm, defined in the communication network **106**. In accordance with various embodiments, the unique cryptographic identifier may be a public key-private key pair, a unique identifier, or a hash value corresponding to the first content consumer **110***a*.

[0074] At **404**, it may be determined whether the unique cryptographic identifier is found in the alternate data store **214***a* associated with the first node **102***a*. The alternate data store **214***a* may be created using at least the distributed media rights transaction ledger **104**, in which each new content consumer joining the communication network **106** is recorded as a media content rights transaction. In cases, where the unique cryptographic identifier of the first content consumer **110***a* is found in the alternate data store **214***a*, the control passes back to **304** in flowchart **300** of FIG. **3**, else to **406**.

[0075] At **406**, validator system may be checked based on the distributed media rights transaction ledger **104**. In accordance with an embodiment, the validator systems that may include entities that may have previously interacted with the first content consumer **110***a* may be checked using the distributed media rights transaction ledger **104**. The validator system (not shown) may request to validate the identity of the first content consumer **110***a* from a prior entity representing, for example the direct broadcast satellite service provider, using the distributed media rights transaction ledger **104**. When the first content consumer **110***a* is interacting through the first node **102***a*, which belongs to a given entity, that owns or acts on behalf of for example the gateway system **202**, in the communication network **106**, the first content consumer **110***a* may be considered to be owned by the first node **102***a*. This may secure the communication network **106** by ensuring that: a) first content consumer **110***a* transactions adhere to the defined protocol as enforced by the proxying node, for example the first node **102***a*; b) the entity that owns or acts on behalf of, for example the gateway system **202**, assumes responsibility over media content rights transactions requested by the first content

consumer **110***a*; and c) another entity, such as the validator, may request to validate the identity of the first content consumer **110***a* from a prior owner, for example another gateway system, using the distributed media rights transaction ledger **104**.

[0076] At **408**, it may be checked whether a validator is present for the unique cryptographic identifier using the distributed media rights transaction ledger **104**. In an embodiment, a validator is found for the unique cryptographic identifier of the first content consumer **110***a* using the distributed media rights transaction ledger **104**, and the control passes back to **304** in flowchart **300** of FIG. **3**, else to **410**.

[0077] At **410**, the first content consumer **110***a* may be invalidated. In accordance with an embodiment, the first node **102***a* may invalidate the first content consumer **110***a* and deny an access to the communication network **106**.

[0078] Referring to flowchart **300** in FIG. **3**, at **304**, the first content consumer **110***a* may be validated based on the existence of the unique cryptographic identifier of the first content consumer **110***a* in the alternate data store **214***a* of the first node **102***a* or in the distributed media rights transaction ledger **104**. In accordance with an embodiment, the first node **102***a* may be configured to validate the first content consumer **110***a* based on the existence of the unique cryptographic identifier of the first content consumer **110***a* in the alternate data store **214***a* of the first node **102***a* or in the distributed media rights transaction ledger **104**. In another embodiment, the first content consumer **110***a* may be validated based on presence of the validator for the unique cryptographic identifier of the first content consumer **110***a*. Control passes to **306** for such validation of the first content consumer **110***a*.

[0079] At **306**, media content rights request, corresponding to media content selection from the first content consumer **110***a* via the first consumer device **114***a*, may be received. In accordance with an embodiment, the first node **102***a* may be configured to receive media content rights request, corresponding to media content selection, from the first content consumer **110***a* via the first consumer device **114***a*.

[0080] At **308**, availability of the media content rights associated with the selected media content may be determined in the unified library/custom catalog **214***b* owned by the first node **102***a*. The unified library/custom catalog **214***b* may correspond to a collection of media content belonging to one or more entities having media content rights available for acquisition, distribution, and/or consumption. In accordance with an embodiment, first content consumer **110***a* may provide a selection of a new media content which is not presented by the unified library/custom catalog **214***b*. For example, the unified library/custom catalog **214***b* may include media content that is previously purchased by the first content consumer **110***a* (for example, iTunes®), media content owned the first node **102***a* (for example Netflix®), media content for which the first node **102***a* (for example Netflix®) has rights to redistribute, and media content (for example media content from Disney®) for which the first node **102***a* (for example Netflix®) does not have media content rights.

[0081] At **310**, it may be determined whether the media content rights (associated with selected media content) are available. In accordance with an embodiment, the first node **102***a* may determine whether the media content rights (associated with selected media content) are available in the unified library/custom catalog **214***b* owned by the first node **102***a*. In this regard, it may be determined whether the first content consumer **110***a* or the first entity **108***a* associated with the first node **102***a* have an access of the media content rights associated with the selected media content in the unified library/custom catalog **214***b* owned by the first node **102***a*.

[0082] In accordance with an embodiment, the first node **102***a* may determine that the media content rights (associated with selected media content) are available in the unified library/custom catalog **214***b*. Accordingly, the control passes to **322**. In accordance with another embodiment, the first node **102***a* may determine that the media content rights (associated with selected media content) are not available in the unified library/custom catalog **214***b*. Accordingly, the control passes to **312**.

[0083] At **322**, when the media content rights associated with the selected media content are available at the first node **102***a*, the media content may be selected from the unified library/custom catalog **214***b* provided by the first node **102***a*. In this regard, the first content consumer **110***a* may select the media content from the unified library/custom catalog **214***b* identified, prepared, and presented by first node **102***a*. The first entity **108***a* who owns the gateway node, such as the first node **102***a*, may act on behalf of the first content consumer **110***a* to acquire the media content rights to consume the media content and gather metadata associated with the available media content.

[0084] At **312**, it may be determined whether the media content rights (associated with selected media content) are available with the second entity or the third entity. In accordance with an embodiment, the first node **102***a* may determine that the media content rights (associated with selected media content) are available with the second entity, for example the content distributor system **204**, associated with the second node **102***b*. Accordingly, control passes to **314***a*. In accordance with another embodiment, the first node **102***a* may determine that the media content rights (associated with selected media content) are available with the third entity, for example the content owner system **206**, associated with the third node **102***c*. Accordingly, control passes to **314***b*.

[0085] At **314***a*, the media content rights may be dynamically acquired from the second entity associated with the second node **102***b* configured to redistribute the media content rights to the first content consumer **110***a*. In accordance with an embodiment, the first node **102***a* may be configured to dynamically acquire the media content rights from the second entity associated with a second node **102***b* (that may redistribute the media content rights to the first content consumer **110***a*) by negotiating with the second entity associated with the second node **102***b* that has the media content rights to redistribute. In accordance with an embodiment, the first entity **108***a* associated with the first node **102***a* may be configured to acquire the media content rights from the second entity associated with the second node **102***b* when the first content consumer **110***a* or the first entity **108***a* associated with the first node **102***a* do not have an access of media content rights associated with the selected media content. In such embodiment, second entity (such as a content distributor) associated with the second node **102***b* may have media content rights to distribute (or re-distribute) the first media asset, previously acquired from

a third entity (such as a content owner) associated with the third node **102***c*. Thus, the first entity **108***a* associated with the first node **102***a* of the plurality of nodes **102***a* . . . , **102***n* interacts with the corresponding instance of the distributed media rights transaction ledger **104** in the communication network **106**, may act on behalf of the first content consumer **110***a* to acquire one or more media content rights for consumption of the media content by the first consumer device **110***a*.

[0086] At **314***b*, the media content rights may be acquired from the third entity associated with the third node **102***c* configured to directly provide the media content rights to the first content consumer **110***a*. In accordance with an embodiment, the first node **102***a* may be configured to acquire the media content rights from the third entity associated with the third node **102***c* (that may directly provide the media content rights) by negotiating with the third entity associated with the third node **102***c* that owns the media content and associated media content rights. In this regard, the first content consumer **110***a* may consume the media content directly from the third entity associated with the third node **102***c* via the first node **102***a*. Thus, the first entity **108***a* associated with the first node **102***a* of the plurality of nodes **102***a* . . . , **102***n* interacts with the corresponding instance of the distributed media rights transaction ledger **104** in the communication network **106**, may act on behalf of the first content consumer **110***a* to acquire one or more media content rights for consumption of the media content by the first consumer device **110***a*.

[0087] At **316**, the media content rights may be negotiated for, based on interaction between nodes from the plurality of nodes **102***a*, . . . , **102***n* in accordance with defined protocol in the communication network **106**. In accordance with an embodiment, the first entity **108***a* associated with the first node **102***a* may be configured to negotiate with the second entity associated with the second node **102***b* or the third entity associated with the third node **102***c* for acquisition of the media content rights, based on interaction between nodes from plurality of nodes **102***a*, . . . , **102***n* in accordance with defined protocol in the communication network **106**.

[0088] As described in FIG. **1**, each node of the plurality of nodes **102***a*, . . . , **102***n* may be associated with a corresponding entity, such as a content owner or a content distributor, from the plurality of entities **108***a*, . . . , **108***n*. In accordance with an embodiment, the first node **102***a* may be configured to create at least one media content rights transaction with one or more nodes, such as the second node **102***b* or the third node **102***c* of the plurality of nodes **102***a*, . . . , **102***n*. The one or more nodes may further cryptographically secure transaction data of the at least one media content rights transaction, which is stored in corresponding instance of the distributed media rights transaction ledger **104**. In accordance with an embodiment, the one or more nodes may digitally sign the hash transaction data with a private key of a private key-public key pair, and share a public key of the private key-public key pair with remaining nodes of the plurality of nodes **102***a*, . . . , **102***n* and maintains the private key as a secret key.

[0089] The one or more media content rights transactions may comprise at least one of a cryptographic signature of an originating entity associated with a corresponding node, another cryptographic signature of a recipient entity, identities of the one or more media content rights for a specific media content, negotiated terms of the one or more media content rights, identities of one or more participants, disparate live media output stream for consumption by a content consumer and/or pre-encoded media asset, a descriptor for an intent of a transaction, an encrypted summary of a set of transactions, one or more cryptographic signatures of historic transactions from the distributed media rights transaction ledger **104** to link at least two transactions, and a cryptographic hash of transaction data. In accordance with an embodiment, each of the plurality of media content rights transactions **112***a*, . . . , **112***n* may be categorized based on an announcement of a newly created entity, an announcement of a newly created content consumer, an announcement of a newly available media content, an acquisition of the one or more media content rights, and/or a consumption of the media content by a content consumer. In accordance with an embodiment, an invalid transaction may be added to the distributed media rights transaction ledger **104**, remains invalid, and serves as a historical record of origin of invalid transactions.

[0090] In accordance with an embodiment, the first node **102***a* of the plurality of nodes **102***a*, . . . , **102***n* may be configured to manage at least one media content rights transaction of a plurality of media content rights transactions **112***a*, . . . , **112***n* with remaining nodes, such as the one or more nodes of the plurality of nodes **102***a*, . . . , **102***n*. The plurality of media content rights transactions **112***a*, . . . , **112***n* may be managed by the plurality of nodes **102***a*, . . . , **102***n* in accordance with the defined protocol in the communication network **106**.

[0091] In accordance with an embodiment, the plurality of media content rights transactions **112***a*, . . . , **112***n* may originate from a node, for example the first node **102***a* of the plurality of nodes **102***a*, . . . , **102***n*, and facilitate exchange of data with one or more nodes, such as the second node **102***b* or the third node **102***c*, in the communication network **106**.

[0092] In accordance with various embodiments, a node of the plurality of nodes **102***a*, . . . , **102***n* may be further configured to verify one or more media content rights transactions of the plurality of media content rights transactions **112***a*, . . . , **112***n* communicated by the one or more remaining nodes of the plurality of nodes **102***a*, . . . , **102***n*. Further, the node may reject a set of invalid media content rights transactions from the one or more media content rights transactions **112***a*, . . . , **112***n*. Furthermore, the node may create new media content rights transactions on behalf of at least one of a content consumer, content distributor, or content owner, and communicate the new media content rights transactions to the one or more remaining nodes where such new media content rights transactions may be stored in corresponding instances of the distributed media rights transaction ledger **104**. In this regard, a receiving entity, such as the second and the third entities, may be responsible for cryptographically securing the entire set of media content rights transactions associated with the negotiation of media content rights, for example as a summary hash. The receiving entity may sign the summary has with its private key (of the same private key-public key pair used throughout the communication network **106** for corresponding entity). The receiving entity may be configured to collect the summary hash and broadcast as a media content rights transaction to the entire communication network **106** to be added as a new media content rights transaction on the distributed media rights transaction ledger **104**. The entities

participating in the media content rights negotiations may elect to encrypt the details of the negotiation sequence to obscure the parameters of the final media content rights transaction from the distributed media rights transaction ledger **104**.

[0093] In accordance with an embodiment, the node may be further configured to enforce a plurality of constraints associated with the one or more media content rights defined in at least one transaction of the plurality of media content rights transactions **112***a*, . . . , **112***n* for a participant to acquire, distribute, or consume content associated with the one or more media content rights. Examples of the plurality of constraints may include, but are not limited to date/time range restriction of playback and/or length of media content rights transferal, rights transferal to specific receiving entity and/or restricted content consumers, number of times playback is allowed, possibility to transfer playback right to another content consumer or entity, downloading/offline access of media content rights and/or playback restrictions, whether sending and receiving entities can watch the media content simultaneously or if mutually exclusive rights transferal is permitted wherein only one party (i.e., either sending or receiving entities) can watch the media content at any moment in time, consumer device-related restrictions (for example mobile only, and no TVs allowed), and/or media content quality restrictions (for example, high definition is not available). In accordance with an embodiment, the node may be further configured to enforce an adherence of known nodes to the protocol by refusing or accepting to communicate with the known nodes of the plurality of nodes **102***a*, . . . , **102***n*.

[0094] In accordance with an embodiment, the node, such as the first node **102***a*, may be further configured to create respective private channels to communicate private media content rights transactions between two entities via nodes, such as the second node **102***b* or the third node **102***c*, associated with respective entities. Each node may represent at least one participant on the communication network **106** based on signed transactions originated from the node with a cryptographic signature of corresponding participant. In accordance with an embodiment, the node may be further configured to determine one or more new nodes which join the communication network **106** within a defined time period, and communicate information associated with the plurality of nodes **102***a*, . . . , **102***n* to the one or more new nodes.

[0095] At **318**, the plurality of media content rights transactions **112***a*, . . . , **112***n* may be stored in corresponding instances of the distributed media rights transaction ledger **104** maintained by each node within the communication network **106** for validation and synchronization. In accordance with an embodiment, the plurality of media content rights transactions **112***a*, . . . , **112***n* may be stored in corresponding instances of the distributed media rights transaction ledger **104** maintained by each node of the plurality of nodes **102***a*, . . . , **102***n* within the communication network **106** for validation and synchronization. Each instance of the distributed media rights transaction ledger **104** may include the plurality of media content rights transactions **112***a*, . . . , **112***n* categorized and defined based on the defined protocol. In accordance with an embodiment, the one or more nodes of the plurality of nodes **102***a*, . . . **102***n* associated with the plurality of participants **108***a*, . . . , **108***n* and **110***a*, . . . , **110***n* may be configured to store the plurality of media content rights transactions **112***a*, . . . , **112***n* in corresponding instances of the distributed media rights transaction ledger **104** maintained by each node of the plurality of nodes **102***a*, . . . , **102***n* within the communication network **106** for validation and synchronization. In this regard, each node may append its own media content right transactions as well as media content right transactions from other nodes in its own instance of the distributed media rights transaction ledger **104**.

[0096] In accordance with various embodiments, the distributed media rights transaction ledger **104** may be configured to maintain, across the plurality of participants **108***a*, . . . , **108***n* and **110***a*, . . . , **110***n*, a validated state of the one or more media content rights granted. The distributed media rights transaction ledger **104** may maintain a secured and validated historical record of consumption of the media content by the plurality of content consumers **110***a*, . . . , **110***n*, and maintain secured and validated identities of the plurality of participants **108***a*, . . . , **108***n* and **110***a*, . . . , **110***n*. The distributed media rights transaction ledger **104** may further maintain a history of constraints for acquisition, distribution, consumption, and transfer of ownership of the one or more media content rights. The distributed media rights transaction ledger **104** may further maintain a history of negotiations via a sequence of media content rights transactions which occur between at least two participants of the plurality of participants **108***a*, . . . , **108***n* and **110***a*, . . . , **110***n*.

[0097] In accordance with an embodiment, data for the plurality of media content rights transactions **112***a*, . . . , **112***n* for the distributed media rights transaction ledger **104** may be synchronized across the plurality of nodes **102***a*, . . . , **102***n* in the communication network **106**. Thus, the distributed media rights transaction ledger **104** may be secured to ensure integrity of data shared across the plurality of nodes **102***a*, . . . , **102***n*. In accordance with an embodiment, the at least one node of the plurality of nodes **102***a*, . . . , **102***n* may be further configured to maintain a corresponding instance of the distributed media rights transaction ledger **104** and communicate the corresponding instance of the distributed media rights transaction ledger **104** to the one or more remaining nodes upon request.

[0098] At **320**, the media content rights may be provided to the first consumer device **114***a* based on the dynamically provided media content rights. In accordance with an embodiment, the first node **102***a* may be configured to provide the media content rights acquired from the second node **102***b* or the third node **102***c* to the first consumer device **114***a*. In accordance with an embodiment, the media player of the first consumer device **114***a* may be provided a link of the media content from the media content master repository **222** of the third entity associated with the third node **102***c* to start viewing the media content based on the dynamically acquired rights.

[0099] FIG. **5** is a conceptual diagram illustrating an example of a hardware implementation for a system employing a processing system for establishing a network of nodes and participants for dynamic management of media content rights, in accordance with an exemplary embodiment of the disclosure. Referring to FIG. **5**, the hardware implementation shown by a representation **500** for the ecosystem **100** employs a processing system **502** for establishing a network of nodes and participants for dynamic management of media

content rights, in accordance with an exemplary embodiment of the disclosure, as described herein.

[0100] In some examples, the processing system **502** may comprise one or more hardware processors **504**, a non-transitory computer-readable medium **506**, a bus **508**, a bus interface **510**, and a transceiver **512**. FIG. **5** further illustrates the plurality of nodes **102***a*, . . . , **102***n*, the distributed media rights transaction ledger **104**, the plurality of entities **108***a*, . . . , **108***n*, and the plurality of media content rights transactions **112***a*, . . . , **112***n*, as described in detail in FIG. **1**.

[0101] The hardware processor **504** may be configured to manage the bus **508** and general processing, including the execution of a set of instructions stored on the non-transitory computer-readable medium **506**. The set of instructions, when executed by the hardware processor **504**, causes the ecosystem **100** to execute the various functions described herein for any particular apparatus. The hardware processor **504** may be implemented, based on a number of processor technologies known in the art. Examples of the hardware processor **504** may be a Reduced Instruction Set Computing (RISC) processor, an Application-Specific Integrated Circuit (ASIC) processor, a Complex Instruction Set Computing (CISC) processor, and/or other processors or control circuits.

[0102] The non-transitory computer-readable medium **506** may be used for storing data that is manipulated by the hardware processor **504** when executing the set of instructions. The data is stored for short periods or in the presence of power. The non-transitory computer-readable medium **506** may also be configured to store data for the plurality of nodes **102***a*, . . . , **102***n*, the distributed media rights transaction ledger **104**, the plurality of entities **108***a*, . . . , **108***n*, and the plurality of media content rights transactions **112***a*, . . . , **112***n*.

[0103] The bus **508** is configured to link together various circuits. In this example, the ecosystem **100** employing the processing system **502** and the non-transitory computer-readable medium **506** may be implemented with bus architecture, represented generally by bus **508**. The bus **508** may include any number of interconnecting buses and bridges depending on the specific implementation of the ecosystem **100** and the overall design constraints. The bus interface **510** may be configured to provide an interface between the bus **508** and other circuits, such as, transceiver **512**, and external devices, such as the plurality of consumer devices **114***a*, . . . , **114***n* associated with respective content consumers of the plurality of content consumers **110***a*, . . . , **110***n*.

[0104] The transceiver **512** may be configured to provide a communication of the communication network **106** with various other apparatus, such as the plurality of consumer devices **114***a*, . . . , **114***n* associated with respective content consumers of the plurality of content consumers **110***a*, . . . , **110***n*, via the network **116**. The transceiver **512** may communicate via wireless communication with networks, such as the Internet, the Intranet and/or a wireless network, such as a cellular telephone network, a wireless local area network (WLAN) and/or a metropolitan area network (MAN). The wireless communication may use any of a plurality of communication standards, protocols and technologies, such as Global System for Mobile Communications (GSM), Enhanced Data GSM Environment (EDGE), Long Term Evolution (LTE), wideband code division multiple access (W-CDMA), code division multiple access (CDMA), time division multiple access (TDMA), Bluetooth, Wireless Fidelity (Wi-Fi) (such as IEEE 802.11a, IEEE 802.11b, IEEE 802.11g and/or IEEE 802.11n), voice over Internet Protocol (VoIP), and/or Wi-MAX.

[0105] It should be recognized that, in some embodiments of the disclosure, one or more components of FIG. **5** may include software whose corresponding code may be executed by at least one processor, for across multiple processing environments. For example, the plurality of nodes **102***a*, . . . , **102***n*, the distributed media rights transaction ledger **104**, the plurality of entities **108***a*, . . . , **108***n*, and the plurality of media content rights transactions **112***a*, . . . , **112***n*, may include software that may be executed across a single or multiple processing environments.

[0106] In an aspect of the disclosure, the hardware processor **504**, the non-transitory computer-readable medium **506**, or a combination of both may be configured or otherwise specially programmed to execute the operations or functionality of the plurality of nodes **102***a*, . . . , **102***n*, the distributed media rights transaction ledger **104**, the plurality of entities **108***a*, . . . , **108***n*, and the plurality of media content rights transactions **112***a*, . . . , **112***n*, or various other components described herein, as described with respect to FIGS. **1** to **4**.

[0107] Various embodiments of the disclosure comprise the ecosystem **100** that may be configured to establish a network of nodes and participants for dynamic management of media content rights. In an embodiment, the ecosystem **100** may comprise a plurality of nodes **102***a*, . . . , **102***n* configured to interact with each other in accordance with a defined protocol in the communication network **106**. At least one node of the plurality of nodes **102***a*, . . . , **102***n* may be associated with a corresponding participant interacts with one of remaining nodes of the plurality of nodes **102***a*, . . . , **102***n* associated with a participant which owns media content and maintains control over enforcement of media content rights associated with the media content. The at least one node of the plurality of nodes **102***a*, . . . , **102***n* may be configured to manage at least one media content rights transaction of a plurality of media content rights transactions **112***a*, . . . , **112***n* with one or more remaining nodes of the plurality of nodes **102***a*, . . . , **102***n*. The plurality of media content rights transactions **112***a*, . . . , **112***n* may be managed by the plurality of nodes **102***a*, . . . , **102***n* in accordance with the defined protocol in the communication network **106**. The ecosystem **100** may further comprise a plurality of instances of a distributed media rights transaction ledger **104** associated with a respective node of the plurality of the nodes **102***a*, . . . , **102***n*. Each instance of the distributed media rights transaction ledger **104** may include the plurality of media content rights transactions **112***a*, . . . , **112***n* categorized and defined based on the defined protocol.

[0108] In accordance with an embodiment, the at least one node of the plurality of nodes **102***a*, . . . , **102***n* may be further configured to maintain a corresponding instance of the distributed media rights transaction ledger **104** and communicate the corresponding instance of the distributed media rights transaction ledger **104** to the one or more remaining nodes upon request.

[0109] In accordance with an embodiment, the at least one node of the plurality of nodes **102***a*, . . . , **102***n* may be further configured to verify the one or more media content rights transactions of the plurality of media content rights transactions **112***a*, . . . , **112***n*, wherein the one or more media

content rights transactions are communicated by the one or more remaining nodes, reject a set of invalid media content rights transactions from the one or more media content rights transactions, create new media content rights transactions on behalf of at least one of a content consumer, content distributor, or content owner, and communicate the new media content rights transactions to the one or more remaining nodes.

[0110] In accordance with an embodiment, the at least one node of the plurality of nodes **102***a*, . . . , **102***n* may be further configured to determine one or more new nodes which joined the communication network **106** within a defined time period, and communicate information associated with the plurality of nodes **102***a*, . . . , **102***n* to the one or more new nodes.

[0111] In accordance with an embodiment, the corresponding participant may be an entity or a content consume. The entity may be one of a content owner and a content distributor. The content owner may own one or more media contents and associated one or more media content rights. The content distributor may acquire the one or more media content rights from the content owner or a different content distributor for further redistribution to the different content distributor or the content owner. The content consumer may be associated with at least one consumer device which executes the one or more media content rights to acquire licenses to consume the media content.

[0112] In accordance with an embodiment, a node of the plurality of nodes **102***a*, . . . , **102***n* that is configured to act as an electronic gateway, such as the gateway system **202**, for a consumer device associated with the content consumer to connect with at least one node of the plurality of nodes **102***a*, . . . , **102***n*. The node of the plurality of nodes **102***a*, . . . , **102***n* may be further configured to determine an identity of the content consumer from credentials of the content consumer. The identity may be derived from a globally unique cryptographic identifier associated with the content consumer and determine that the identity of the content consumer exists in an alternate data store, such as the alternate data store **214***a*, that is created based on at least a corresponding instance of the distributed media rights transaction ledger **104**. The alternate data store **214***a* may include a set of transactions of the plurality of media content rights transactions that correspond to records of the plurality of content consumers **110***a*, . . . , **110***n* that joins the communication network **106** as new content consumers and validate the content consumer based on the existence of the identity of the content consumer in the alternate data store **214***a*.

[0113] In accordance with an embodiment, an entity associated with the node of the plurality of nodes **102***a*, . . . , **102***n* may interact with the corresponding instance of the distributed media rights transaction ledger **104** in the communication network **106**, acts on behalf of the content consumer to acquire one or more media content rights to consume the media content.

[0114] In accordance with an embodiment, an entity associated with the node of the plurality of nodes **102***a*, . . . , **102***n* may present metadata of a plurality of content libraries as a unified library.

[0115] In accordance with an embodiment, the at least one node of the plurality of nodes **102***a*, . . . , **102***n* may be further configured to create respective private channels to communicate private media content rights transactions between two entities.

[0116] In accordance with an embodiment, the at least one node may be further configured to enforce a plurality of constraints associated with the one or more media content rights defined in at least one transaction of the plurality of media content rights transactions **112***a*, . . . , **112***n* for a participant to acquire, distribute, or consume content associated with the one or more media content rights.

[0117] In accordance with an embodiment, each node may represent at least one participant on the communication network **106** based on signed transactions originated from the node with a cryptographic signature of corresponding participant.

[0118] In accordance with an embodiment, an entity may become an owner of a content consumer when the content consumer is proxied through at least one node associated with the entity to the communication network **106**.

[0119] In accordance with an embodiment, the distributed media rights transaction ledger **104** may be secured to ensure integrity of data shared across the plurality of nodes **102***a*, . . . , **102***n*.

[0120] In accordance with an embodiment, data for the media content rights transactions for the distributed media rights transaction ledger **104** may be synchronized across the plurality of nodes **102***a*, . . . , **102***n* in the communication network **106**. In accordance with an embodiment, the distributed media rights transaction ledger **104** may be further configured to maintain, across the plurality of participants **108***a*, . . . , **108***n* and **110***a*, . . . , **110***n*, a validated state of the one or more media content rights granted, maintain a secured and validated historical record of consumption of media content by one or more content consumers, maintain secured and validated identities of the plurality of participants, maintain a history of constraints for acquisition, distribution, consumption, and transfer of ownership of the one or more media content rights, and maintain a history of negotiations via a sequence of media content rights transactions which occur between at least two participants.

[0121] In accordance with an embodiment, the plurality of media content rights transactions **112***a*, . . . , **112***n* may originate from at least one node of the plurality of nodes **102***a*, . . . , **102***n* and facilitates exchange of data with the plurality of nodes **102***a*, . . . , **102***n* in the communication network **106**.

[0122] In accordance with an embodiment, the plurality of media content rights transactions **112***a*, . . . , **112***n* may be stored in instances of the distributed media rights transaction ledger **104** maintained by each node of the plurality of nodes **102***a*, . . . , **102***n* within the communication network **106** for validation and synchronization.

[0123] In accordance with an embodiment, the one or more media content rights transactions comprise at least one of a cryptographic signature of an originating entity associated with a corresponding node, another cryptographic signature of a recipient entity, identities of the one or more media content rights for a specific media content, negotiated terms of the one or more media content rights, identities of one or more participants, disparate live media output stream for consumption by a content consumer and/or pre-encoded media asset, a descriptor for an intent of a transaction, an encrypted summary of a set of transactions, one or more cryptographic signatures of historic transactions from the distributed media rights transaction ledger **104** to link at least two transactions, and a cryptographic hash of transaction data, and wherein each of the plurality of media content

rights transactions **112***a*, . . . , **112***n* is categorized based on an announcement of a newly created entity, an announcement of a newly created content consumer, an announcement of a newly available media content, an acquisition of the one or more media content rights, and a consumption of the media content by a content consumer.

[0124] In accordance with an embodiment, a node of the plurality of nodes **102***a*, . . . , **102***n* may be further configured to create at least one media content rights transaction and cryptographically hash transaction data of the at least one media content rights transaction, which is stored in corresponding instance of the distributed media rights transaction ledger **104**. In accordance with an embodiment, the node of the plurality of nodes **102***a*, . . . , **102***n* may be further configured to digitally sign the hash transaction data with a private key of a private key-public key pair and share a public key of the private key-public key pair with remaining nodes of the plurality of nodes **102***a*, . . . , **102***n* and maintain the private key as a secret key.

[0125] In accordance with an embodiment, an invalid transaction may be added to the distributed media rights transaction ledger **104**, remains invalid, and wherein the invalid transaction may serve as a historical record of origin of invalid transactions. In accordance with an embodiment, the communication network **106** may be a distributed communication network.

[0126] Various embodiments of the disclosure may provide a computer-readable medium, such as the non-transitory computer-readable medium **506**, having stored thereon, computer-implemented instruction that when executed by the processor **504** causes the ecosystem **100** to establish a network of nodes and participants for dynamic management of media content rights. In accordance with an embodiment, the processor **504** causes the ecosystem **100** to execute operations to configure the plurality of nodes **102***a*, . . . , **102***n* to interact with each other in accordance with a defined protocol in the communication network **106**. At least one node of the plurality of nodes **102***a*, . . . , **102***n* may be associated with a corresponding participant interacts with one of remaining nodes of the plurality of nodes **102***a*, . . . , **102***n* associated with a participant which owns media content and maintains control over enforcement of media content rights associated with the media content. The at least one node of the plurality of nodes **102***a*, . . . , **102***n* may be configured to manage at least one media content rights transaction of a plurality of media content rights transactions **112***a*, . . . , **112***n* with one or more remaining nodes of the plurality of nodes **102***a*, . . . , **102***n*. The plurality of media content rights transactions **112***a*, . . . , **112***n* may be managed by the plurality of nodes **102***a*, . . . , **102***n* in accordance with the defined protocol in the communication network **106**. The system may further comprise a plurality of instances of a distributed media rights transaction ledger **104** associated with a respective node of the plurality of the nodes **102***a*, . . . , **102***n*. Each instance of the distributed media rights transaction ledger **104** may include the plurality of media content rights transactions **112***a*, . . . , **112***n* categorized and defined based on the defined protocol.

[0127] Managing the content rights of millions of media content, by thousands of content owners, content distributors, and tracking a flow of content rights from one entity to other entity, is a herculean task. Currently, content rights clearance and negotiations are very time consuming, and backed by readily accessible/usable data. Further, multiple content libraries by various entities, require separate subscriptions and make it difficult for users to navigate to content of their choice freely without having individual subscription. Further, third party measurement of viewership of a content item, are costly. There is no mechanism to precisely track content rights and royalties for various entities. Further, isolated content catalogs and third-party dependencies to estimate viewership for a content item, such as a TV show, to plan for future advertisement inventory needs and obligations, increase complexities. This in turn increases re-work and requires installation of large infrastructures and resources to maintain uninterrupted content delivery for existing channel and limits the ability of the broadcast or network provider to change content, provide customized content in real time or near-real time.

[0128] The disclosed system and method for dynamic acquisition, re-distribution, enforcement, and tracking of content rights of media content, has several advantages, for example, a) Providing tokenized and secure content licenses for a media asset; b) Ease-of-use and sharing of catalogs, revenue, content rights makes pirating unjustified; c) content distributors are able to dynamically acquire rights from content owners and pass on the rights to the consumers in real time or near real-time; d) instant user-targeted catalogs may be identified and prepared and pushed to apps, such as a mobile app or a TV app, at consumer devices; e) the ecosystem provides a platform for creation of a marketplace where new media markets, such as a content trading market may emerge; f) content development is user-driven/user-funded; g) digital currency, for example, digital crypto-currencies, may be used easily in network due to the inherent framework of network; h) enables instant settlements using the distributed media rights transaction ledger; and i) simplified, secured, real time, ensured, and fail-safe tracking of media content rights among various participants of the ecosystem.

[0129] As utilized herein the terms "circuits" and "circuitry" refer to physical electronic components (for example, hardware) and any software and/or firmware ("code") which may configure the hardware, be executed by the hardware, and/or otherwise be associated with the hardware. As used herein, for example, a particular processor and memory may comprise a first "circuit" when executing first one or more lines of code and may comprise a second "circuit" when executing second one or more lines of code. As utilized herein, "and/or" means any one or more of the items in the list joined by "and/or". As an example, "x and/or y" means any element of the three-element set {(x), (y), (x, y)}. As another example, "x, y, and/or z" means any element of the seven-element set {(x), (y), (z), (x, y), (x, z), (y, z), (x, y, z)}. As utilized herein, the term "exemplary" means serving as a non-limiting example, instance, or illustration. As utilized herein, the terms "e.g.," and "for example" set off lists of one or more non-limiting examples, instances, or illustrations. As utilized herein, circuitry is "operable" to perform a function whenever the circuitry comprises the necessary hardware and/or code (if any is necessary) to perform the function, regardless of whether performance of the function is disabled, or not enabled, by some user-configurable setting.

[0130] The terminology used herein is for the purpose of describing particular embodiments only and is not intended to be limiting of embodiments of the disclosure. As used herein, the singular forms "a", "an" and "the" are intended

to include the plural forms as well, unless the context clearly indicates otherwise. It will be further understood that the terms "comprises", "comprising", "includes" and/or "including", when used herein, specify the presence of stated features, integers, steps, operations, elements, and/or components, but do not preclude the presence or addition of one or more other features, integers, steps, operations, elements, components, and/or groups thereof.

[0131] Further, many embodiments are described in terms of sequences of actions to be performed by, for example, elements of a computing device. It will be recognized that various actions described herein can be performed by specific circuits (e.g., application specific integrated circuits (ASICs)), by program instructions being executed by one or more processors, or by a combination of both. Additionally, these sequences of actions described herein can be considered to be embodied entirely within any non-transitory form of computer readable storage medium having stored therein a corresponding set of computer instructions that upon execution would cause an associated processor to perform the functionality described herein. Thus, the various aspects of the disclosure may be embodied in a number of different forms, which have been contemplated to be within the scope of the claimed subject matter. In addition, for each of the embodiments described herein, the corresponding form of any such embodiments may be described herein as, for example, "logic configured to" perform the described action.

[0132] The present disclosure may also be embedded in a computer program product, which comprises all the features enabling the implementation of the methods described herein, and which when loaded in a computer system is able to carry out these methods. Computer program in the present context means any expression, in any language, code or notation, either statically or dynamically defined, of a set of instructions intended to cause a system having an information processing capability to perform a particular function either directly or after either or both of the following: a) conversion to another language, code or notation; b) reproduction in a different material form.

[0133] Further, those of skill in the art will appreciate that the various illustrative logical blocks, modules, circuits, algorithms, and/or steps described in connection with the embodiments disclosed herein may be implemented as electronic hardware, computer software, firmware, or combinations thereof. To clearly illustrate this interchangeability of hardware and software, various illustrative components, blocks, modules, circuits, and steps have been described above generally in terms of their functionality. Whether such functionality is implemented as hardware or software depends upon the particular application and design constraints imposed on the overall system. Skilled artisans may implement the described functionality in varying ways for each particular application, but such implementation decisions should not be interpreted as causing a departure from the scope of the present disclosure.

[0134] The methods, sequences and/or algorithms described in connection with the embodiments disclosed herein may be embodied directly in firmware, hardware, in a software module executed by a processor, or in a combination thereof. A software module may reside in RAM memory, flash memory, ROM memory, EPROM memory, EEPROM memory, registers, hard disk, physical and/or virtual disk, a removable disk, a CD-ROM, virtualized system or device such as a virtual servers or container, or any other form of storage medium known in the art. An exemplary storage medium is communicatively coupled to the processor (including logic/code executing in the processor) such that the processor can read information from, and write information to, the storage medium. In the alternative, the storage medium may be integral to the processor.

[0135] While the present disclosure has been described with reference to certain embodiments, it will be noted understood by, for example, those skilled in the art that various changes and modifications could be made, and equivalents may be substituted without departing from the scope of the present disclosure as defined, for example, in the appended claims. In addition, many modifications may be made to adapt a particular situation or material to the teachings of the present disclosure without departing from its scope. The functions, steps and/or actions of the method claims in accordance with the embodiments of the disclosure described herein need not be performed in any particular order. Furthermore, although elements of the disclosure may be described or claimed in the singular, the plural is contemplated unless limitation to the singular is explicitly stated. Therefore, it is intended that the present disclosure not be limited to the particular embodiment disclosed, but that the present disclosure will include all embodiments falling within the scope of the appended claims.

What is claimed is:

1. A system comprising:

a plurality of nodes configured to interact with each other in accordance with a defined protocol in a communication network,

wherein at least one node of the plurality of nodes associated with a corresponding participant interacts with one of remaining nodes of the plurality of nodes associated with a participant which owns media content and maintains control over enforcement of media content rights associated with the media content,

wherein at least one node of the plurality of nodes is configured to manage at least one media content rights transaction of a plurality of media content rights transactions with one or more remaining nodes of the plurality of nodes, and

wherein the plurality of media content rights transactions is managed by the plurality of nodes in accordance with the defined protocol in the communication network; and

a plurality of instances of a distributed media rights transaction ledger associated with a respective node of the plurality of the nodes,

wherein each instance of the distributed media rights transaction ledger includes the plurality of media content rights transactions categorized and defined based on the defined protocol.

2. The system of claim **1**, wherein the at least one node of the plurality of nodes is further configured to:

maintain a corresponding instance of the distributed media rights transaction ledger; and

communicate the corresponding instance of the distributed media rights transaction ledger to the one or more remaining nodes upon request.

3. The system of claim **1**, wherein the at least one node of the plurality of nodes is further configured to:

verify one or more media content rights transactions of the plurality of media content rights transactions,

wherein the one or more media content rights transactions are communicated by the one or more remaining nodes;

reject a set of invalid media content rights transactions from the one or more media content rights transactions;

create new media content rights transactions on behalf of at least one of a content consumer, content distributor, or content owner; and

communicate the new media content rights transactions to the one or more remaining nodes.

4. The system of claim **1**, wherein the at least one node of the plurality of nodes is further configured to:

determine one or more new nodes which joined the communication network within a defined time period; and

communicate information associated with the plurality of nodes to the one or more new nodes.

5. The system of claim **1**, wherein the corresponding participant is an entity or a content consumer,

wherein the entity is one of a content owner and a content distributor,

wherein the content owner owns one or more media contents and associated one or more media content rights,

wherein the content distributor acquires the one or more media content rights from the content owner or a different content distributor for further redistribution to the different content distributor or the content owner, and

wherein the content consumer is associated with at least one consumer device which executes the one or more media content rights to acquire licenses to consume the media content.

6. The system of claim **5**, wherein a node of the plurality of nodes that is configured to act as an electronic gateway for a consumer device associated with the content consumer to connect with at least one node of the plurality of nodes,

wherein the node of the plurality of nodes is further configured to:

determine an identity of the content consumer from credentials of the content consumer, wherein the identity is derived from a globally unique cryptographic identifier associated with the content consumer;

determine that the identity of the content consumer exists in an alternate data store that is created based on at least a corresponding instance of the distributed media rights transaction ledger, wherein the alternate data store includes a set of transactions of the plurality of media content rights transactions that correspond to records of a plurality of content consumers that joins the communication network as new content consumers; and

validate the content consumer based on an existence of the identity of the content consumer in the alternate data store.

7. The system of claim **6**, wherein an entity associated with the node of the plurality of nodes interacts with the corresponding instance of the distributed media rights transaction ledger in the communication network, acts on behalf of the content consumer to acquire the one or more media content rights to consume media content.

8. The system of claim **6**, wherein an entity associated with the node of the plurality of nodes presents metadata of a plurality of content libraries as a unified library

9. The system of claim **1**, wherein the at least one node of the plurality of nodes is further configured to create respective private channels to communicate private media content rights transactions between corresponding entities.

10. The system of claim **1**, wherein the at least one node is further configured to enforce a plurality of constraints associated with media content rights defined in at least one transaction of the plurality of media content rights transactions for a participant to acquire, distribute, or consume content associated with the media content rights.

11. The system of claim **1**, wherein each node represents at least one participant on the communication network based on signed transactions originated from the node with a cryptographic signature of corresponding participant.

12. The system of claim **1**, wherein an entity becomes an owner of a content consumer when the content consumer is proxied through at least one node associated with the entity to the communication network.

13. The system of claim **1**, wherein the distributed media rights transaction ledger is secured to ensure integrity of data shared across the plurality of nodes.

14. The system of claim **1**, wherein data for the plurality of media content rights transactions for the distributed media rights transaction ledger is synchronized across the plurality of nodes in communication network.

15. The system of claim **1**, wherein the distributed media rights transaction ledger is further configured to:

maintain, across a plurality of participants, a validated state of the media content rights granted;

maintain a secured and validated historical record of consumption of media content by one or more content consumers;

maintain secured and validated identities of the plurality of participants;

maintain a history of constraints for acquisition, distribution, consumption, and transfer of ownership of the media content rights; and

maintain a history of negotiations via a sequence of media content rights transactions which occur between at least two participants.

16. The system of claim **1**, wherein the plurality of media content rights transactions originates from at least one node of the plurality of nodes and facilitates exchange of data with the plurality of nodes in the communication network.

17. The system of claim **1**, wherein the plurality of media content rights transactions is stored in instances of the distributed media rights transaction ledger maintained by each node of the plurality of nodes within the communication network for validation and synchronization.

18. The system of claim **1**, wherein each of the plurality of media content rights transactions comprise at least one of a cryptographic signature of an originating entity associated with a corresponding node, another cryptographic signature of a recipient entity, identities of the media content rights for a specific media content, negotiated terms of the media content rights, identities of one or more participants, disparate live media output stream for consumption by a content consumer and/or pre-encoded media asset, a descriptor for an intent of a transaction, an encrypted summary of a set of transactions, one or more cryptographic signatures of historic transactions from the distributed media rights transac-

tion ledger to link at least two transactions, and a cryptographic hash of transaction data, and

wherein each of the plurality of media content rights transactions is categorized based on an announcement of a newly created entity, an announcement of a newly created content consumer, an announcement of a newly available media content, an acquisition of the media content rights, and consumption of the media content by a content consumer.

19. The system of claim **1**, wherein an invalid transaction added to the distributed media rights transaction ledger, remains invalid, and

wherein the invalid transaction serves as a historical record of origin of invalid transactions.

20. The system of claim **1**, wherein a node of the plurality of nodes is further configured to create at least one media content rights transaction and cryptographically hash transaction data of the at least one media content rights transaction, which is stored in corresponding instance of the distributed media rights transaction ledger.

21. The system of claim **20**, wherein the node of the plurality of nodes is further configured to:

digitally sign the hash transaction data with a private key of a private key-public key pair; and

share a public key of the private key-public key pair with remaining nodes of the plurality of nodes and maintains the private key as a secret key.

22. The system of claim **1**, wherein the communication network is a distributed communication network.

23. A method comprising:

determining, by a first node of a plurality of nodes, an availability of media content rights associated with a selected media content in a storage unit owned by the first node;

initiating, by the first node, an interaction with a second node or a third node of the plurality of nodes in accordance with a defined protocol in a communication network,

wherein the first node of the plurality of nodes is associated with a corresponding participant interacts with one of remaining nodes of the plurality of nodes associated with a participant which owns media content and maintains control over enforcement of media content rights associated with the media content;

managing, by the first node, at least one media content rights transaction of a plurality of media content rights transactions with one or more remaining nodes of the plurality of nodes based on the interaction in accordance with the defined protocol in the communication network; and

storing, by the first node, the plurality of media content rights transactions in a corresponding instance of distributed media rights transaction ledger maintained within the communication network,

wherein each instance of the distributed media rights transaction ledger includes the plurality of media content rights transactions categorized and defined based on the defined protocol.

24. The method of claim **23**, wherein the at least one node of the plurality of nodes is further configured to:

maintain a corresponding instance of the distributed media rights transaction ledger; and

communicate the corresponding instance of the distributed media rights transaction ledger to the one or more remaining nodes upon request.

25. The method of claim **23**, wherein the at least one node of the plurality of nodes is further configured to:

verify one or more media content rights transactions of the plurality of media content rights transactions, wherein the one or more media content rights transactions are communicated by the one or more remaining nodes;

reject a set of invalid media content rights transactions from the one or more media content rights transactions;

create new media content rights transactions on behalf of at least one of a content consumer, content distributor, or content owner; and

communicate the new media content rights transactions to the one or more remaining nodes.

26. The method of claim **23**, wherein the at least one node of the plurality of nodes is further configured to:

determine one or more new nodes which joined the communication network within a defined time period; and

communicate information associated with the plurality of nodes to the one or more new nodes.

27. The method of claim **23**, wherein the corresponding participant is an entity or a content consumer,

wherein the entity is one of a content owner and a content distributor,

wherein the content owner owns one or more media contents and associated one or more media content rights,

wherein the content distributor acquires the one or more media content rights from the content owner or a different content distributor for further redistribution to the different content distributor or the content owner, and

wherein the content consumer is associated with at least one consumer device which executes the one or more media content rights to acquire licenses to consume the media content.

28. The method of claim **27**, wherein a node of the plurality of nodes that is configured to act as an electronic gateway for a consumer device associated with the content consumer to connect with at least one node of the plurality of nodes,

wherein the node of the plurality of nodes is further configured to:

determine an identity of the content consumer from credentials of the content consumer, wherein the identity is derived from a globally unique cryptographic identifier associated with the content consumer;

determine that the identity of the content consumer exists in an alternate data store that is created based on at least a corresponding instance of the distributed media rights transaction ledger, wherein the alternate data store includes a set of transactions of the plurality of media content rights transactions that correspond to records of a plurality of content consumers that joins the communication network as new content consumers; and

validate the content consumer based on an existence of the identity of the content consumer in the alternate data store.

29. The method of claim **28**, wherein an entity associated with the node of the plurality of nodes interacts with the corresponding instance of the distributed media rights transaction ledger in the communication network, acts on behalf of the content consumer to acquire the media content rights to consume media content.

30. The method of claim **28**, wherein an entity associated with the node of the plurality of nodes presents metadata of a plurality of content libraries as a unified library

31. The method of claim **23**, wherein the at least one node of the plurality of nodes is further configured to create respective private channels to communicate private media content rights transactions between corresponding entities.

32. The method of claim **23**, wherein the at least one node is further configured to enforce a plurality of constraints associated with the media content rights defined in at least one transaction of the plurality of media content rights transactions for a participant to acquire, distribute, or consume content associated with the media content rights.

33. The method of claim **23**, wherein each node represents at least one participant on the communication network based on signed transactions originated from the node with a cryptographic signature of corresponding participant.

34. The method of claim **23**, wherein an entity becomes an owner of a content consumer when the content consumer is proxied through at least one node associated with the entity to the communication network.

35. The method of claim **23**, wherein the distributed media rights transaction ledger is secured to ensure integrity of data shared across the plurality of nodes.

36. The method of claim **23**, wherein data for the media content rights transactions for the distributed media rights transaction ledger is synchronized across the plurality of nodes in communication network.

37. The method of claim **23**, wherein the distributed media rights transaction ledger is further configured to:

maintain, across a plurality of participants, a validated state of the media content rights granted;

maintain a secured and validated historical record of consumption of media content by one or more content consumers;

maintain secured and validated identities of the plurality of participants;

maintain a history of constraints for acquisition, distribution, consumption, and transfer of ownership of the media content rights; and

maintain a history of negotiations via a sequence of the plurality of media content rights transactions which occur between at least two participants.

38. The method of claim **23**, wherein the plurality of media content rights transactions originates from at least one node of the plurality of nodes and facilitates exchange of data with the plurality of nodes in the communication network.

39. The method of claim **23**, wherein the plurality of media content rights transactions is stored in instances of the distributed media rights transaction ledger maintained by each node of the plurality of nodes within the communication network for validation and synchronization.

40. The method of claim **23**, wherein the plurality of media content rights transactions comprise at least one of a cryptographic signature of an originating entity associated with a corresponding node, another cryptographic signature of a recipient entity, identities of the media content rights for a specific media content, negotiated terms of the media content rights, identities of one or more participants, disparate live media output stream for consumption by a content consumer and/or pre-encoded media asset, a descriptor for an intent of a transaction, an encrypted summary of a set of transactions, one or more cryptographic signatures of historic transactions from the distributed media rights transaction ledger to link at least two transactions, and a cryptographic hash of transaction data, and

wherein each of the plurality of media content rights transactions is categorized based on an announcement of a newly created entity, an announcement of a newly created content consumer, an announcement of a newly available media content, an acquisition of the media content rights, and consumption of the media content by a content consumer.

41. The method of claim **23**, wherein an invalid transaction added to the distributed media rights transaction ledger, remains invalid, and

wherein the invalid transaction serves as a historical record of origin of invalid transactions.

42. The method of claim **23**, wherein a node of the plurality of nodes is further configured to create at least one media content rights transaction and cryptographically hash transaction data of the at least one media content rights transaction, which is stored in corresponding instance of the distributed media rights transaction ledger.

43. The method of claim **42**, wherein the node of the plurality of nodes is further configured to:

digitally sign the hash transaction data with a private key of a private key-public key pair; and

share a public key of the private key-public key pair with remaining nodes of the plurality of nodes and maintains the private key as a secret key.

44. The method of claim **23**, wherein the communication network is a distributed communication network.

45. A non-transitory computer-readable medium having stored thereon, computer implemented instruction that when executed by a processor in a computer, causes the computer to execute operations, the operations comprising:

in a communication network:

determining, by a first node of a plurality of nodes, an availability of media content rights associated with a selected media content in a storage unit owned by the first node;

initiating, by the first node, an interaction with a second node or a third node of the plurality of nodes in accordance with a defined protocol in the communication network,

wherein the first node of the plurality of nodes is associated with a corresponding participant interacts with one of remaining nodes of the plurality of nodes associated with a participant which owns media content and maintains control over enforcement of media content rights associated with the media content;

managing, by the first node, at least one media content rights transaction of a plurality of media content rights transactions with one or more remaining nodes of the plurality of nodes based on the interaction in accordance with the defined protocol in the communication network; and

storing, by the first node, the plurality of media content rights transactions in a corresponding instance of

distributed media rights transaction ledger maintained within the communication network,

wherein each instance of the distributed media rights transaction ledger includes the plurality of media content rights transactions categorized and defined based on the defined protocol.
