PIVOTED TARGET MEMBER

Barbara Whitehouse, Birmingham, England

Application November 29, 1944, Serial No. 565,615
In Great Britain December 13, 1943

5 Claims. (Cl. 273—127)

1

This invention relates to apparatus for playing a game of the kind comprising a frame adapted to stand on a playing surface and having a rod upon which are suspended a number of playing pieces which can be made to rotate or swing over on the rod by a ball or other missile projected along the playing surface.

The object of the present invention is to provide certain improvements in game apparatus of this character.

The invention is illustrated in the accompanying drawing, wherein:

Figure 1 is a perspective view showing one form of the apparatus.

Figure 2 is a section on line 2—2 of Figure 1.

In the construction illustrated the support for the playing pieces may consist of a wooden or other frame having two end members 10 adapted to stand on the floor or table connected together by a top member 11 of wood or other material, thus forming a frame. Each of the end members 10 has pivoted to it at 12 an arm 13, this arm being capable of being moved into a horizontal position in which it abuts against a stop 14, or of being moved into a vertical position as shown in chain dot lines in Figure 1 to enable the apparatus to be backed into a small space. When extended the arms 13 project at opposite sides of the frame.

Means may be provided for spacing the playing pieces 15 apart laterally and also for spacing the end playing pieces away from the inner surfaces of the end members 10 of the frame and such spacing means may consist of a body 16 made of sheet material and secured to the upper surface of the top 11 of the frame, this body having a number of V-shaped depending loops 17 which project downwardly and engage around the lower of a rod 18 between the playing pieces 15 which are suspended on the rod.

The playing pieces 15 may be made of sheet material such as cardboard and each may consist of three rectangular panels of equal size meeting and secured together, or formed integrally at their shorter edges. Thus each playing piece forms an equilateral triangular prism with the ends missing.

The playing pieces are freely suspended upon the horizontal rod 18 and between the loops 17. Normally each playing piece hangs by its apex and its base is parallel to the floor or table and a sufficient distance from it to allow the playing piece to swing over on the rod 18 when one side of it is struck.

2

Each of the three panels of each playing piece bears a mark of identification which may take any form. The mark of identification may consist of a distinctive colour, a distinctive pattern marked in spots, lines or any other form, or the representation of a bird, beast or fish, or a tree, fruit, flower or any other subject.

All the playing pieces have one face marked with the same mark of identification so that it is possible to arrange the playing pieces so that they all show the same mark of identification when viewed from one side of the frame.

If desired all the playing pieces may have a second face marked with the same mark of identification which however, may be different from the mark of identification upon the first set of faces.

In use the apparatus is placed on the floor or table and two players or two groups of players take up positions at an equal distance on either side of it.

Balls 19 are provided for the players which can be rolled over the floor and each side may play in turn, the object being to move the playing pieces until the faces directed towards the players all show the same mark of identification.

What I claim then is:

1. Apparatus for playing a game comprising a frame adapted to stand upon a playing surface, a supporting body of folded sheet material having a top member carried by the frame and spaced from the playing surface, a plurality of relatively spaced loops dependent from the top member, the loops being of V-shape, a rod supported in and by the loops, a plurality of spaced playing pieces formed as open ended prisms suspended freely on the rod, the playing pieces being adapted to be rotated on the rod or swung over by a ball or other missile projected along the playing surface from either side of the apparatus and emerging on the other side.

2. Apparatus for playing a game comprising a frame adapted to stand upon a playing surface, a supporting body of folded sheet material having a top member carried by the frame and spaced from the playing surface, a plurality of relatively spaced loops dependent from the top member, a rod supported in and by the loops, a plurality of spaced playing pieces formed as open ended prisms suspended freely on the rod, the playing pieces being adapted to be rotated on the rod or swung over by a ball or other missile projected along the playing surface from either side of the apparatus and emerging on the other side, playing pieces being spaced from the frame

3

and from each other by the intervening loops.

3. Apparatus for playing a game comprising a frame adapted to stand upon a playing surface, a supporting body of folded sheet material having a top member carried by the frame and spaced from the playing surface, a plurality of relatively spaced loops dependent from the top member, a rod supported in and by the loops, a plurality of spaced playing pieces formed as open ended prisms suspended freely on the rod, the playing pieces being adapted to be rotated on the rod or swung over by a ball or other missile projected along the playing surface from either side of the apparatus and emerging on the other side, the playing pieces having marks of identification upon their exposed sides, all the playing pieces having the same mark of identification upon one face.

4. Apparatus for playing a game comprising a frame adapted to stand upon a playing surface, a supporting body of folded sheet material having a top member carried by the frame and spaced from the playing surface, a plurality of relatively spaced loops dependent from the top member, a rod supported in and by the loops, a plurality of spaced playing pieces formed as open ended prisms suspended freely on the rod, the playing pieces being adapted to be rotated on the rod or swung over by a ball or other missile projected along the playing surface from either side of the apparatus and emerging on the other side, the frame including end members, each end member on its outer side and at its lower end having an arm shorter in length than the end member pivotally mounted thereon upon an axis parallel to the rod, a stop for each arm adapted to retain the arm in a definite angular position in relation to the end member to which it is attached, the said arms extending in opposite

4

directions each in engagement with its positive stop when the apparatus is in use and the arms being foldable to be lengthwise along their respective end members when the apparatus is not in use.

5. Apparatus for playing a game comprising a frame adapted to stand upon a playing surface, a supporting body of folded sheet material having a top member carried by the frame and spaced from its playing surface, a plurality of relatively spaced loops dependent from the top member, the loops being of V-shape, a rod supported in and by the loops, a plurality of spaced playing pieces formed as open ended prisms suspended freely on the rod, the playing pieces being adapted to be rotated on the rod or swung over by a ball or other missile projected along the playing surface from either side of the apparatus and emerging on the other side, playing pieces being spaced from the frame and from each other by the intervening loops.
