BRIEF SUMMARY OF THE INVENTION

1. Technical Field

This invention relates to the use of acyl urea compounds for the systemic control of endoparasites and ectoparasites of warm-blooded animals.

2. Background of the Invention

Animal parasites, such as mites, lice, ticks, grubs, biting flies, coccidia, flukes, tapeworms, hookworms and other helminths, cause severe economic losses to livestock producers. Infestations may result in reduced feed efficiency, weight loss, decreased production of milk or eggs, and increased incidence of disease or death. The control of animal parasites is therefore one of the most important problems in the field of animal husbandry.

Certain insecticides, such as coumaphos, carbaryl and lindane, are currently available for control of some of these parasites. Insect growth regulators, such as methoprene (juvenile hormone mimic) and diflubenzuron, have been used as feed additives to control fly larvae in livestock and chicken manure. See, for example, Breeden et al, *J. Econ. Entomol.* 68 (4), 451-452 (1975) and Barker and Newton, *J. Ga. Entomol. Soc.* 11 (1), 71-75 (1976). Additionally, Barrett et al, *Southwest Entomol.* 3 (3), 232-236 (1978) and Prasert et al, *J. Econ. Entomol.* 68 (5), 639-640 (1975) report that oral administration of methoprene to cattle and sheep will help control cattle grubs and sheep bot fly respectively. Devaney and Kubena, *Insecticide and Acaricide Tests* 7, 247 (1982) concluded that diflubenzuron, on the other hand, was not effective for systemic control of northern fowl mite on poultry.

Systemic control of animal parasites is accomplished by absorbing a parasiticide in the bloodstream or other tissues of the host animal. Parasites which eat or come into contact with the parasiticide-containing blood or tissue are killed, either by ingestion or contact. Only a very few insecticides have been found to be sufficiently nontoxic to be used systemically in animals.

Accordingly, the object of this invention is to provide a method for the use of certain acyl urea compounds to systemically control animal parasites. This and other objects will readily become apparent to those skilled in the art in light of the teachings herein set forth.

DISCLOSURE OF THE INVENTION

This invention relates to a method for controlling parasites of warm-blooded animals which comprises administering to the animal a parasitically effective amount of a compound having the formula:

wherein R₁, R₂, R₃, R₄ and Y are as defined hereinafter.

DETAILED DESCRIPTION

As indicated above, this invention relates to a method of controlling parasites of warm-blooded animals by administration of certain acyl urea compounds. More particularly, this invention involves a method for controlling endoparasites and ectoparasites of warm-blooded animals by orally or percutaneously administering to the animal a parasitically effective amount of a compound having the formula:

wherein:

R₁ and R₄ are independently a substituted or unsubstituted, carbocyclic or heterocyclic ring system selected from a monocyclic aromatic or nonaromatic ring system, a bicyclic aromatic or nonaromatic ring system, a polycyclic aromatic or nonaromatic ring system, and a bridged ring system which may be saturated or unsaturated in which the permissible substituents (Z) are the same or different and are one or more hydrogen, halogen, alkylcarbonyl, alkylcarbonylalkyl, alkoxy carbonylalkyl, alkoxy carbonylalkylthio, polyhaloalkenylthio, thiocyno, propargylthio, hydroxyimino, alkoxyimino, trialkylsilyloxy, aryldialkylsilyloxy, triarylsilyloxy, foramidino, alkylsulfamido, dialkylsulfamido, alkoxy sulfonyl, polyhaloalkoxy sulfonyl, hydroxy, amino, aminocarbonyl, alkylaminocarbonyl, dialkylaminocarbonyl, aminothiocarbonyl, alkylaminothiocarbonyl, dialkylaminothiocarbonyl, nitro, cyano, hydroxycarbonyl and derivative salts, formamido, alkyl, alkoxy, polyhaloalkyl, polyhaloalkoxy, alkoxy carbonyl, substituted amino in which the permissible substituents are the same or different and are one or two propargyl, alkoxyalkyl, alkylthioalkyl, alkyl, alkenyl, haloalkenyl or polyhaloalkenyl; alkylthio, polyhaloalkylthio, alkylsulfanyl, polyhaloalkylsulfanyl, alkylsulfonyl, polyhaloalkylsulfonyl, alkylsulfonamino, alkylcarbonylamino, polyhaloalkylsulfonamino, polyhaloalkylcarbonylamino, trialkylsilyl, aryldialkylsilyl, triarylsilyl, sulfonic acid and derivative salts, phosphonic acid and derivative salts, alkoxy carbonylamino, alkylaminocarbonyloxy, dialkylaminocarbonyloxy, alkenyl, polyhaloalkenyl, alkenyloxy, alkynyl, alkynyloxy, polyhaloalkenyloxy, polyhaloalkynyl, polyhaloalkynyloxy, polyfluoroalkanol, cyanoalkylamino, semicarbazonomethyl, alkoxy carbonylhydrazonomethyl, alkoxyiminomethyl, unsubstituted or substituted aryloximinomethyl, hydrazonomethyl, unsubstituted or substituted arylhydrazonomethyl, a hydroxy group condensed with a mono-, di- or polysaccharide,

5

alkylsulfonyl, polyhaloalkylsulfonyl, alkylsulfonylamino, alkylcarbonylamino, polyhaloalkylsulfonylamino, polyhaloalkylcarbonylamino, trialkylsilyl, aryldialkylsilyl, triarylsilyl, sulfonic acid and derivative salts, phosphonic acid and derivative salts, alkoxy-carbonylamino, alkylaminocarbonyloxy, dialkylaminocarbonyloxy, alkenyl, polyhaloalkenyl, alkenyloxy, alkynyl, alkynyloxy, polyhaloalkenyloxy, polyhaloalkynyl, polyhaloalkynyloxy, polyfluoroalkanol, cyanoalkylamino, semicarbazonomethyl, alkoxy-carbonylhydrazonomethyl, alkoxyiminomethyl, unsubstituted or substituted aryloxyiminomethyl, hydrazonomethyl, unsubstituted or substituted arylhydrazonomethyl, a hydroxy group condensed with a mono-, di- or polysaccharide,

or R₄ is hydrogen;

Y is oxygen or sulfur; and

R₂ and R₃ are independently hydrogen, alkyl, substituted alkyl in which the permissible substituents are the same or different and are one or more halogen, alkoxy, alkylthio, or cyano; cycloalkyl, cycloalkenyl, substituted benzyl in which the permissible substituents are the same or different and are one or more halogen, hydroxy, nitro, cyano, alkyl, polyhaloalkyl, alkoxy or polyhaloalkoxy; hydroxy, alkoxy, polyhaloalkoxy, alkylthio, polyhaloalkylthio, acyl, alkoxy-carbonyl, alkoxythiocarbonyl, alkylsulfonyl, substituted phenylsulfonyl in which the permissible substituents are the same or different and are one or more halogen, nitro, cyano or polyhaloalkyl; substituted phenylthio in which the permissible substituents are the same or different and are one or more halogen, alkyl, nitro, cyano, polyhaloalkyl, or substituted or unsubstituted alkoxy-carbonyl, alkenoxycarbonyl, alkynoxycarbonyl, cycloalkoxycarbonyl, phenoxycarbonyl, hydroxycarbonyl or the alkali metal salt or ammonium salt thereof, alkyl, alkoxy, alkylthio, cycloalkyl, cycloalkyloxy, cycloalkylthio, alkenyl, alkenylthio, alkanoyl, alkylsulfonyl, alkynyl, phenyl, phenoxy, phenylthio or amino; N-(alkylcarbonyl)-N-alkylaminothio, alkoxy-carbonylthio, trialkylsilyl, dialkylarylsilyl, thiarylsilyl,

or R₂ and R₃ are independently

6

or R₂ and R₃ may be linked together to form a substituted or unsubstituted, heterocyclic ring system which may be saturated or unsaturated and in which the permissible substituents (Z) are the same or different and are one or more hydrogen, halogen, alkylcarbonyl, alkylcarbonylalkyl, alkoxy-carbonylalkyl, alkoxy-carbonylalkylthio, polyhaloalkenylthio, thiocyno, propargylthio, hydroxyimino, alkoxyimino, trialkylsilyloxy, aryldialkylsilyloxy, triarylsilyloxy, foramidino, alkylsulfamido, dialkylsulfamido, alkoxy-sulfonyl, polyhaloalkoxysulfonyl, hydroxy, amino, aminocarbonyl, alkylaminocarbonyl, dialkylaminocarbonyl, aminothio-carbonyl, alkylaminothiocarbonyl, dialkylaminothio-carbonyl, nitro, cyano, hydroxycarbonyl and derivative salts, formamido, alkyl, alkoxy, polyhaloalkyl, polyhaloalkoxy, alkoxy-carbonyl, substituted amino in which the permissible substituents are the same or different and are one or two propargyl, alkoxyalkyl, alkylthioalkyl, alkyl, alkenyl, haloalkenyl or polyhaloalkenyl; alkylthio, polyhaloalkylthio, alkylsulfinyl, polyhaloalkylsulfinyl, alkylsulfonyl, polyhaloalkylsulfonyl, alkylsulfonylamino, alkylcarbonylamino, polyhaloalkylsulfonylamino, polyhaloalkylcarbonylamino, trialkylsilyl, aryldialkylsilyl, triarylsilyl, sulfonic acid and derivative salts, phosphonic acid and derivative salts, alkoxy-carbonylamino, alkylaminocarbonyloxy, dialkylaminocarbonyloxy, alkenyl, polyhaloalkenyl, alkenyloxy, alkynyl, alkynyloxy, polyhaloalkenyloxy, polyhaloalkynyl, polyhaloalkynyloxy, polyfluoroalkanol, cyanoalkylamino, semicarbazonomethyl, alkoxy-carbonylhydrazonomethyl, alkoxyiminomethyl, unsubstituted or substituted aryloxyiminomethyl, hydrazonomethyl, unsubstituted or substituted arylhydrazonomethyl, a hydroxy group condensed with a mono-, di- or polysaccharide,

Certain Z groups which may be substituted or unsubstituted include aryloxyiminomethyl and arylhydrazonomethyl. Other groups within the definition of R₂ and R₃ which may be substituted or unsubstituted include alkoxy-carbonyl, alkenoxycarbonyl, alkynoxycarbonyl, cycloalkoxycarbonyl, phenoxycarbonyl, hydroxycarbonyl or the alkali metal salt or ammonium

salt thereof, alkyl, alkoxy, alkylthio, cycloalkyl, cycloalkyloxy, cycloalkylthio, alkenyl, alkenylthio, alkanoyl, alkylsulfonyl, alkynyl, phenyl, phenoxy, phenylthio and amino. Permissible substituents for these groups include independently one or more halogen, alkyl, alkoxy, polyhaloalkyl, polyhaloalkoxy, cyano, nitro, alkylthio, alkylsulfinyl, alkylsulfonyl, polyhaloalkylthio, polyhaloalkylsulfonyl, trialkylsilyl and arylalkylsilyl in any combination.

The alkyl-containing moieties above may contain from about 1 to about 100 carbon atoms or greater, preferably from about 1 to about 30 carbon atoms, and more preferably from about 1 to about 20 carbon atoms. The polysaccharide moiety may contain up to about 50 carbon atoms.

Monocyclic ring systems encompassed by R_1 , R_4 and R_5 in formula 1 may be represented by generalized formula 2 as follows:

wherein B_1 represents a saturated or unsaturated carbon atom and A_1 represents a ring-forming chain of atoms which together with B_1 forms a cyclic system containing from 0 to 3 double bonds or from 0 to 2 triple bonds. A_1 may contain entirely from 2 to 12 carbon atoms, may contain a combination of from 1 to 11 carbon atoms and from 1 to 4 heteroatoms which may be selected independently from N, O, S, P or other heteroatoms, or may contain 4 ring-forming heteroatoms alone.

Ring-forming heteroatoms may in some cases bear oxygen atoms as in aromatic N-oxides and ring systems containing the sulfinyl, sulfonyl, selenoxide and phosphono moieties.

Selected carbon atoms contained in cycles formed by B_1 and A_1 containing more than 3 ring-forming atoms may bear carbonyl, thiocarbonyl, substituted or unsubstituted imino groups or substituted or unsubstituted methyldene groups.

The group designated as Z represents one or more substituents selected independently from among the group of substituents defined for Z herein. When the cycle formed by B_1 and A_1 contains fewer than 4 ring forming members, it should be a saturated carbocycle, i.e. cyclopropyl. When the cycle formed by B_1 and A_1 contains fewer than 5 ring-forming members, it should contain no more than 1 heteroatom.

Representative illustrations of A_1 include the following:

(1) A chain of from 2-12 carbon atoms which together with B_1 contains 0 double bonds;

(2) A chain of from 4-12 carbon atoms which together with B_1 contains 1 double bond;

(3) A chain of from 4-12 carbon atoms which together with B_1 contains 2 double bonds;

(4) A chain of from 5-12 carbon atoms which together with B_1 contains 3 double bonds;

(5) A chain containing 1 heteroatom and from 2 to 11 carbon atoms which together with B_1 contains 0 double bonds;

(6) A chain containing 1 heteroatom and from 3-11 carbon atoms which together with B_1 contains 1 double bond;

(7) A chain containing 1 heteroatom and from 3-11 carbon atoms which together with B_1 contains 2 double bonds;

(8) A chain containing 1 heteroatom and from 4-11 carbon atoms which together with B_1 contains 3 double bonds;

(9) A chain containing 2 heteroatoms and from 2-10 carbon atoms which together with B_1 contains 0 double bonds;

(10) A chain containing 2 heteroatoms and from 2-10 carbon atoms which together with B_1 contains 1 double bond;

(11) A chain containing 2 heteroatoms and from 2-10 carbon atoms which together with B_1 contains 2 double bonds;

(12) A chain containing 2 heteroatoms and from 3-10 carbon atoms which together with B_1 contains 3 double bonds;

(13) A chain containing 3 heteroatoms and from 1-9 carbon atoms which together with B_1 contains 0 double bonds;

(14) A chain containing 3 heteroatoms and from 1-9 carbon atoms which together with B_1 contains 1 double bond;

(15) A chain containing 3 heteroatoms and from 1-9 carbon atoms which together with B_1 contains 2 double bonds;

(16) A chain containing 3 heteroatoms and from 2-9 carbon atoms which together with B_1 contains 3 double bonds;

(17) A chain containing 4 heteroatoms and from 0-8 carbon atoms which together with B_1 contains 0 double bonds;

(18) A chain containing 4 heteroatoms and from 0-8 carbon atoms which together with B_1 contains 1 double bond;

(19) A chain containing 4 heteroatoms and from 0-8 carbon atoms which together with B_1 contains 2 double bonds; and

(20) A chain containing 4 heteroatoms and from 1-8 carbon atoms which together with B_1 contains 3 double bonds.

Illustrative monocyclic ring structures which are encompassed by R_1 , R_4 and R_5 in formula 1 include the following:

-continued

wherein Z is as defined herein.

Bicyclic ring systems encompassed by R₁, R₄ and R₅ in formula 1 may be represented by generalized formulae 3 and 4 as follows:

wherein B₂ and B₃ may be independently a saturated or unsaturated carbon atom or a saturated nitrogen atom, A₂ and A₃ independently represent the ring-forming chains of atoms described below and Z represents one or more substituents selected independently from among the group of substituents defined for Z herein. Combinations of A₂ and A₃ may be selected from among the arrays of atoms listed below in items (21) through (98) and may contain in combination with either B₁ or B₂, but not both, from 0 to 2 double bonds. A₂ and A₃, independent of B₂ and B₃, may contain entirely from 1 to 11 carbon atoms, may contain a combination of 1 to 3 heteroatoms which may be selected independently from among N, O, S, P or other heteroatoms together with from 1 to 10 carbon atoms or may contain from 1-3 ring-forming heteroatoms alone.

Ring-forming heteroatoms may in some cases bear oxygen atoms, as in aromatic N-oxides and ring systems containing the sulfinyl, sulfonyl, selenoxide and phosphono groups. Selected carbon atoms contained in A₂ and A₃ may bear carbonyl, thiocarbonyl, substituted or

unsubstituted imino groups or substituted or unsubstituted methylidene groups.

In regard to structures encompassed within formulae 3 and 4, it is noted as follows:

- 5 (a) When B₂ and B₃ are both nitrogen, the groups A₂ and A₃ should each contain no fewer than three ring atoms;
- (b) When B₂ but not B₃ is nitrogen, either of A₂ or A₃ should contain at least three ring atoms and the other at
- 10 least two ring atoms;
- (c) When either of groups A₂ or A₃ contains fewer than three ring atoms, the other should contain at least three ring atoms and the bridgehead atoms should be saturated;
- 15 (d) When the group A₂ or A₃ contains a carbon atom bearing a carbonyl, thiocarbonyl, imino or methylidene group, it should together with B₂ and B₃ form a cycle having at least four members;
- (e) When an annular double bond is exocyclic to either
- 20 of the two rings represented in structures 3 and 4, it should be contained in a ring containing at least five members and be exocyclic to a ring containing at least five members; and
- (f) When a group A₂ or A₃ is joined to the bridgehead
- 25 atoms B₁ and B₂ by 2 double bonds, the group A₂ or A₃ is understood to contain one double bond and the bridgehead atoms are considered to be unsaturated.

It is recognized that bicyclic ring systems defined for R₁, R₄ and R₅ may be spirocyclic ring systems and are not limited to the fused bicyclic structures of formulae 3 and 4. Spirocyclic ring systems may be saturated or unsaturated carbocyclic or heterocyclic and may be independently substituted by one or more substituents Z as defined herein.

- 3 35 Illustrative combinations of A₂ and A₃ which are encompassed within generalized formulae 3 and 4 are listed below as follows:

(21) A₂ is a chain containing from 1-11 carbon atoms which together with B₂ or B₃ contains 0 double bonds and A₃ is a chain containing 3-11 carbon atoms which together with B₂ or B₃ contains 0 double bonds;

(22) A₂ is a chain containing from 3-11 carbon atoms which together with B₂ or B₃ contains 1 double bond and A₃ is a chain containing 3-11 carbon atoms which together with B₂ or B₃ contains 0 double bonds;

(23) A₂ is a chain containing from 3-11 carbon atoms which together with B₂ or B₃ contains 1 double bond and A₃ is a chain containing 3-11 carbon atoms which together with B₂ or B₃ contains 1 double bond;

(24) A₂ is a chain containing from 3-11 carbon atoms which together with B₂ or B₃ contains 2 double bonds and A₃ is a chain containing 3-11 carbon atoms which together with B₂ or B₃ contains 0 double bonds;

(25) A₂ is a chain containing from 3-11 carbon atoms which together with B₂ or B₃ contains 2 double bonds and A₃ is a chain containing 3-11 carbon atoms which together with B₂ or B₃ contains 1 double bond;

(26) A₂ is a chain containing from 3-11 carbon atoms which together with B₂ or B₃ contains 2 double bonds and A₃ is a chain containing 4-11 carbon atoms which together with B₂ or B₃ contains 2 double bonds;

(27) A₂ is a chain containing 1 heteroatom and from 0-10 carbon atoms which together with B₂ or B₃ contains 0 double bonds and A₃ is a chain containing 1-11 carbon atoms which together with B₂ or B₃ contains 0 double bonds;

(28) A₂ is a chain containing 1 heteroatom and from 2-10 carbon atoms which together with B₂ or B₃ con-

oms and from 1-9 carbon atoms which together with B₂ or B₃ contains 1 double bond;

(83) A₂ is a chain containing 2 heteroatoms and from 1-9 carbon atoms which together with B₂ or B₃ contains 2 double bonds and A₃ is a chain containing 2 heteroatoms and from 2-9 carbon atoms which together with B₂ or B₃ contains 2 double bonds;

(84) A₂ is a chain containing 3 heteroatoms and from 0-8 carbon atoms which together with B₂ or B₃ contains 0 double bonds and A₃ is a chain containing 2 heteroatoms and from 1-9 carbon atoms which together with B₂ or B₃ contains 0 double bonds;

(85) A₂ is a chain containing 3 heteroatoms and from 1-8 carbon atoms which together with B₂ or B₃ contains 1 double bond and A₃ is a chain containing 2 heteroatoms and from 1-9 carbon atoms which together with B₂ or B₃ contains 0 double bonds;

(86) A₂ is a chain containing 3 heteroatoms and from 1-8 carbon atoms which together with B₂ or B₃ contains 2 double bonds and A₃ is a chain containing 2 heteroatoms and from 1-9 carbon atoms which together with B₂ or B₃ contains 0 double bonds;

(87) A₂ is a chain containing 3 heteroatoms and from 0-8 carbon atoms which together with B₂ or B₃ contains 0 double bonds and A₃ is a chain containing 2 heteroatoms and from 1-9 carbon atoms which together with B₂ or B₃ contains 1 double bond;

(88) A₂ is a chain containing 3 heteroatoms and from 0-8 carbon atoms which together with B₂ or B₃ contains 1 double bond and A₃ is a chain containing 2 heteroatoms and from 1-9 carbon atoms which together with B₂ or B₃ contains 1 double bond;

(89) A₂ is a chain containing 3 heteroatoms and from 0-8 carbon atoms which together with B₂ or B₃ contains 2 double bonds and A₃ is a chain containing 2 heteroatoms and from 1-9 carbon atoms which together with B₂ or B₃ contains 1 double bond;

(90) A₂ is a chain containing 3 heteroatoms and from 0-8 carbon atoms which together with B₂ or B₃ contains 0 double bonds and A₃ is a chain containing 2 heteroatoms and from 1-9 carbon atoms which together with B₂ or B₃ contains 2 double bonds;

(91) A₂ is a chain containing 3 heteroatoms and from 1-8 carbon atoms which together with B₂ or B₃ contains 1 double bond and A₃ is a chain containing 2 heteroatoms and from 2-9 carbon atoms which together with B₂ or B₃ contains 2 double bonds;

(92) A₂ is a chain containing 3 heteroatoms and from 1-8 carbon atoms which together with B₂ or B₃ contains 2 double bonds and A₃ is a chain containing 2 heteroatoms and from 2-9 carbon atoms which together with B₂ or B₃ contains 2 double bonds;

(93) A₂ is a chain containing 3 heteroatoms and from 1-8 carbon atoms which together with B₂ or B₃ contains 0 double bonds and A₃ is a chain containing 3 heteroatoms and from 1-8 carbon atoms which together with B₂ or B₃ contains 0 double bonds;

(94) A₂ is a chain containing 3 heteroatoms and from 2-8 carbon atoms which together with B₂ or B₃ contains 1 double bond and A₃ is a chain containing 3 heteroatoms and from 2-8 carbon atoms which together with B₂ or B₃ contains 0 double bonds;

(95) A₂ is a chain containing 3 heteroatoms and from 1-8 carbon atoms which together with B₂ or B₃ contains 2 double bonds and A₃ is a chain containing 3 heteroatoms and from 0-8 carbon atoms which together with B₂ or B₃ contains 0 double bonds;

(96) A₂ is a chain containing 3 heteroatoms and from 1-8 carbon atoms which together with B₂ or B₃ contains 1 double bond and A₃ is a chain containing 3 heteroatoms and from 1-8 carbon atoms which together with B₂ or B₃ contains 1 double bond;

(97) A₂ is a chain containing 3 heteroatoms and from 1-8 carbon atoms which together with B₂ or B₃ contains 2 double bonds and A₃ is a chain containing 3 heteroatoms and from 1-8 carbon atoms which together with B₂ or B₃ contains 1 double bond; and

(98) A₂ is a chain containing 3 heteroatoms and from 1-8 carbon atoms which together with B₂ or B₃ contains 2 double bonds and A₃ is a chain containing 3 heteroatoms and from 1-8 carbon atoms which together with B₂ or B₃ contains 2 double bonds.

Polycyclic ring systems, i.e., greater than 2 rings, encompassed by R_1 , R_4 and R_5 in formula 1 may be represented by generalized formulae 5, 6, 7 and 8 as follows:

wherein B_4 , B_5 , B_6 and B_7 may be independently a saturated or unsaturated carbon atom or a saturated nitrogen atom, and A_4 , A_5 , A_6 and A_7 independently represent ring forming chains of atoms which may contain together with one or the other (but not both) of their two associated bridgehead atoms, from 0-2 double bonds. The groups Z represent one or more substituents selected independently from among the group of substituents defined for Z herein.

The ring-forming elements of A_4 , A_5 , A_6 and A_7 independent of B_4 , B_5 , B_6 and B_7 may contain entirely from 1-11 carbon atoms, may contain a combination of from 1-10 carbon atoms and from 1-3 heteroatoms which may be selected independently from among N , O , S , P or other heteroatoms, or may contain from 1-3 heteroatoms alone. Ring-forming heteroatoms may in

some cases bear oxygen atoms as in aromatic N-oxides and ring systems containing the sulfinyl, sulfonyl, selenoxide and phosphono groups. The group A_6 may at times be defined as a bond. Selected carbon atoms contained in A_4 , A_5 , A_6 and A_7 may bear one or more carbonyl, thiocarbonyl or substituted or unsubstituted imino groups.

On structure 8 the groups B_8 , B_9 and B_{10} represent independently a saturated or unsaturated carbon atom or a saturated nitrogen atom. The group B_{11} may represent a saturated or unsaturated carbon atom or a nitrogen or phosphorous atom. The groups A_8 , A_9 and A_{10} represent ring-forming chains of atoms which may contain together with 1 of the groups B_8 , B_9 , B_{10} and B_{11} from 0-2 double bonds.

The ring-forming elements of groups A_8 , A_9 and A_{10} independent of groups B_8 , B_9 , B_{10} and B_{11} may contain entirely from 2-10 carbon atoms, may contain from 1-10 carbon atoms in combination with 1-3 heteroatoms which may be selected independently from among N , O , S , P or other heteroatoms, or may contain from 2-3 heteroatoms alone. Ring-forming heteroatoms may in some cases bear oxygen atoms as in aromatic N-oxides and in ring systems containing the sulfinyl, sulfonyl, selenoxide and phosphono groups. Selected carbon atoms contained in groups A_8 , A_9 and A_{10} may bear one or more carbonyl, thiocarbonyl or substituted or unsubstituted imino groups.

It is recognized that polycyclic ring systems defined for R_1 , R_4 and R_5 may be spirocyclic ring systems and are not limited to the fused polycyclic structures of formulae 5, 6, 7 and 8. Spirocyclic ring systems may be saturated or unsaturated, carbocyclic or heterocyclic and may be independently substituted by one or more substituents Z as defined herein.

Bridged bicyclic structures encompassed by R_1 , R_4 and R_5 in formula 1 may be represented by generalized formulae 9, 10, and 11 as follows:

wherein B_{12} and B_{13} may be independently a saturated carbon atom optionally substituted by Z or a nitrogen atom, and the groups A_{11} , A_{12} and A_{13} independently represent ring-forming chains of atoms which may contain, independently of B_{12} and B_{13} , from 0-2 double bonds. The groups Z represent one or more substituents

selected independently from among the groups of substituents defined for Z herein.

The ring-forming elements of A_{11} , A_{12} and A_{13} , independent of B_{12} and B_{13} , may contain entirely from 1-11 carbon atoms, may contain a combination of from 1-10 carbon atoms and from 1-3 heteroatoms which may be selected independently from among N, O, S, P or other heteroatoms, or may contain from 1-3 heteroatoms alone with the proviso that when one of the groups A_{11} , A_{12} and A_{13} is a single heteroatom, the other two groups should contain two or more ring-forming atoms. A second proviso is that when one or both of the groups B_{12} and B_{13} is nitrogen, the groups A_{11} , A_{12} and A_{13} should contain at least two saturated ring-forming atoms.

Ring-forming heteroatoms may in some cases bear oxygen atoms as in the sulfinyl, sulfonyl, selenoxide and phosphono moieties. Selected carbon atoms contained in A_{11} , A_{12} and A_{13} may bear one or more carbonyl, thiocarbonyl or substituted or unsubstituted imino groups.

The substituent X may be an unsubstituted heteroatom such as an oxygen or sulfur, as in carbonyl and thiocarbonyl systems, or may be a substituted heteroatom or carbon atom. X may also be a covalent single or double bond, or an array of atoms serving to join the ring system R_5 to the remainder of the acyl urea molecule. The group X may be joined to the ring system R_5 by means of a single or double bond. Likewise, X may be attached to the remainder of the acyl urea molecule by means of a double or single bond. X may be a saturated or unsaturated, branched or straight chain of carbon atoms; a branched or straight, saturated or unsaturated chain of atoms consisting of both carbon atoms and heteroatoms; or may be a branched or straight, saturated or unsaturated chain consisting entirely of heteroatoms. Selected heteroatomic components of X may bear oxygen atoms as in the case of groups containing the sulfonyl, sulfinyl, N-oxide and phosphono moieties. Selected heteroatomic components of X may bear one or more substituents Z as defined herein. Selected carbon atoms participating in X may bear carbonyl, thiocarbonyl, substituted or unsubstituted imino, substituted or unsubstituted alkylidene or one or more substituents Z as defined herein.

wherein m is a value of from 0 to 8, n is a value of from 0 to 2, and R₈, R₉, R₁₀ and R₁₁ are independently hydrogen or substituted or unsubstituted alkyl, polyhaloalkyl, phenyl or benzyl in which the permissible substituents are as defined for Z herein.

R₂ and R₃ may be linked together to form a heterocyclic saturated or unsaturated ring system. This ring system may be part of a saturated or unsaturated, aromatic or nonaromatic, carbo- or hetero-, bicyclic or polycyclic ring system. Illustrative of suitable heteroatoms include oxygen, sulfur, nitrogen, silicon and phosphorous. The ring system can be optionally substituted with one or more of the substituents Z as defined herein.

 U.S. patent application Ser. No. 495,331, filed May 40 20, 1983, incorporated herein by reference, discloses and claims 1-(alkylphenoxyaryl)-3-benzoyl urea compounds which may be used in the method of this invention. Such 1-(alkylphenoxyaryl)-3-benzoyl urea compounds can be prepared by the methods described in the application, and are available from Union Carbide 45 Agricultural Products Company, Inc., Research Triangle Park, N.C. Illustrative of the 1-(alkylphenoxyaryl)-3-benzoyl urea compounds of U.S. patent application Ser. No. 495,331 which may be useful in the 50 method of this invention include the following:
 1-[2,5-dimethyl-3-chloro-4-(2,5-dimethyl-4-chlorophenoxy)phenyl]-3-(2-chlorobenzoyl)urea;
 1-[2,5-dimethyl-3-chloro-4-(2,5-dimethyl-4-chlorophenoxy)phenyl]-3-(2-fluorobenzoyl)urea;

U.S. patent application Ser. No. 712,195, filed Mar. 15, 1985, incorporated herein by reference, discloses and claims alpha-cyanobenzyl phenyl benzoyl urea compounds which may be used in the method of this invention. Such alpha-cyanobenzyl phenyl benzoyl urea compounds can be prepared by the methods described in the application, and are available from Union Carbide Agricultural Products Company, Inc., Research Triangle Park, N.C. Illustrative of the alpha-cyanobenzyl phenyl benzoyl urea compounds of U.S. Pat. No. 4,578,402 which may be useful in the method of this invention include the following:

1-[2,5-dichloro-4-(alpha-cyano-4-fluorobenzyl)phenyl]-3-(2,6-difluorobenzoyl)urea;
 1-[2-methyl-5-chloro-4-(alpha-cyano-4-chlorobenzyl)phenyl]-3-(2,6-difluorobenzoyl)urea;
 1-[2,5-dichloro-4-(alpha-cyano-4-chlorobenzyl)phenyl]-3-(2,6-difluorobenzoyl)urea;
 1-[4-(alpha-cyano-4-methylbenzyl)phenyl]-3-(2,6-difluorobenzoyl)urea;
 1-[2,5-dichloro-4-(alpha-cyano-2,4-dimethylbenzyl)phenyl]-3-(2,6-difluorobenzoyl)urea;
 1-[2,5-dichloro-4-(alpha-cyano-4-fluorobenzyl)phenyl]-3-(2-fluorobenzoyl)urea;

It is appreciated that the particular urea compounds listed hereinabove are illustrative of urea compounds which may be used in the method of this invention. The method of this invention is not to be construed as being limited only to the use of these urea compounds; but rather, the method of this invention includes those urea compounds encompassed within formula 1 hereinabove.

The term "parasites" as used in the specification and claims is meant to encompass all endoparasites and ectoparasites of warm-blooded animals as well as pests that breed in the manure of the animals.

In particular, representative parasites which may be controlled by the method of this invention include members of the Arthropoda, including mites of the suborders Mesostigmata, Sarcoptiformes, Trombidiformes and Onychopalpida; sucking and biting lice of the orders Anoplura and Mallophaga; ticks of the families Ixodidae and Argasidae; fleas of the families Pulicidae, Ceratophyllidae, and others; Cimex and other Hemiptera; Triatoma and other Heteroptera; and myiasis-related fly larvae and blood sucking adults (including mosquitoes) of the suborders Brachycera, Cyclorrhapha and Nematocera. Representative also are helminths included in the Nematoda (Strongyloidea, including but not limited to Strongyloidea, Ancylostomatoidea, Trichostrongyloidea and Metastrongyloidea; Ascarida [Ascaris]; Filariina, such as but not limited to Onchocerca and Dirofilaria; Rhabditida; and Trichinellida); Cestoidea, especially Cyclophyllidea, and Trematoda, including Strigeatoidea such as Schistosoma; Echinostomida such as Fasciola; and Plagiorchiida such as Paragonimus. Other parasites which may be controlled by compounds represented by generic formula 1 include Acanthocephala such as Macracanthorhynchus, Onicola or Moniliformis, and Pentastomida, especially Linguatula; and Protozoa, especially Coccidia such as Eimeria and Plasmodium, Piroplasma

such as Babesia; Toxoplasma such as Trypanosoma; Trichomonadidae such as Trichomonas and Entamoebidae such as Entamoeba.

Illustrative of specific parasites of various host animals which may be controlled by the method of this invention include arthropods such as mites (mesostigmatids, itch, mange, scabies, chiggers), ticks (soft-bodied and hard-bodied), lice (sucking, biting), fleas (dog flea, cat flea, oriental rat flea), true bugs (bed bugs, kissing bugs), bloodsucking adult flies (horn fly, horse fly, stable fly, black fly, deer fly, louse fly, tsetse fly, punkies, mosquitoes), and parasitic fly maggots (bot fly, blow fly, screwworm, cattle grub, fleece worm); helminths such as nematodes (threadworm, lungworm, hookworm, whipworm, nodular worm, stomach worm, round worm, pinworm, heartworm), cestodes (tapeworms) and trematodes (liver fluke, blood fluke); protozoa such as coccidia, trypanosomes, trichomonads, amoebas and plasmodia; acanthocephalans such as thorny-headed worms; and pentastomids such as tongue worms.

Also, the acyl urea compounds of formula 1 may be administered to a vertebrate definitive host for control of arthropod intermediate hosts which feed on the feces of the vertebrate host. For example, an arthropod intermediate host of helminths and other disease and nuisance-causing organisms, which arthropod host feeds on the feces of a vertebrate host treated with one or more acyl urea compounds of formula 1, can be controlled by the method of this invention.

The method of parasite control of this invention is of the systemic type. The acyl urea compounds of formula 1 are useful parasiticides for the systemic control of endoparasites and ectoparasites which feed on living tissues of warm-blooded animals. These acyl urea compounds have the ability to permeate the living tissues of a host animal to which one of the acyl urea compounds is administered. Endoparasites and ectoparasites which consume blood or other living tissues of the host animal ingest or contact the acyl urea compound with which the tissue is permeated, and are thereby killed. It is believed that the blood is an agency through which the acyl urea compound is dispersed through the host animal. However, as illustrated in the working examples hereinafter, systemic control is observed from topical (pour-on) applications of acyl urea compounds of formula 1, thereby indicating that the acyl urea compounds permeate other tissues as well as blood. The acyl urea compounds of formula 1 are also effective for the control of pests which breed in the manure of warm-blooded animals.

Endoparasites and ectoparasites which feed on the living tissues of animals are killed by the acyl urea compounds of formula 1. Those parasites which suck the host animal's blood, those which burrow into and feed on the animal's tissue, and those, like the larvae of bot flies, which enter a natural orifice of the host, attach to the mucous membranes, and feed therefrom may be all equally effectively killed.

It is understood that the parasites mentioned above are not confined to the single host animal with which each is generally identified. Certain parasites inhabit various hosts, although most parasites have a favorite host. For example, the mange mite attacks at least horses, hogs, mules, humans, dogs, cats, foxes, rabbits, sheep, and cattle. Horseflies freely attack horses, mules, cattle, hogs, dogs, and most other animals. Use of the acyl urea compounds of formula 1 kills parasites of the

types described above growing in various host animals. For example, these acyl urea compounds may be effective in cats, goats, camels, and zoo animals.

The parasites controlled by the method of this invention normally affect warm-blooded animals. Representative of animals affected are humans and domestic animals such as cattle, horses, sheep, goats, poultry, swine, dogs, and cats.

The time, manner, and rates at which the acyl urea compounds are effectively administered may be varied over a wide range. The acyl urea compounds can be administered to the animals at rates from about 0.01 to about 1000 mg./kg of animal body weight. The best rate for killing a given parasite infesting a given animal must be determined individually, but it is generally found that in most cases the optimum rate is within the preferred range of from about 0.25 to 100 mg./kg. of animal body weight. The optimum rate for a given instance depends on such factors as the activity of the specific acyl urea compound employed, the method of administration, the level of infestation, the duration of control desired, the health of the animal to be treated, the susceptibility of the parasite of primary concern, the expense which can be borne by the animal, and the degree of control desired.

The acyl urea compounds of formula 1 are effective when administered at any time of year to animals of any age. It is possible to administer these acyl urea compounds to the animals continuously, as by constant feeding of a diet which contains one of the acyl urea compounds, and thus assure that all parasites which contact the treated animal will be killed. Such administration, however, may not be economical, and it will often be found best to administer the acyl urea compound at such times as to give the best return of parasite control for the compound expended. Certain parasites have a known active season when they attack animals. If such a parasite is of primary importance, the acyl urea compounds can be used only during the active season with assurance of year-round control of the parasite. Other parasites infest and bite animals essentially the year round. Control of such parasites can still be accomplished with relatively brief periods of administration by administering the acyl urea compounds to all the animals on a farm or in an area for a short period of time, such as for a few weeks. All the parasites of a generation are thus killed, and the animals can be expected to remain parasite-free for a considerable length of time.

Oral administration of an acyl urea compound of formula 1 may be performed by mixing the acyl urea compound in the animal's feed or drinking water, vitamin or mineral supplement, or by administering oral dosage forms such as drenches, tablets, bolus, salt block or capsules. Such oral means of administration are well known in the art.

Percutaneous administration may be conveniently accomplished by subcutaneous, dermal, intramuscular, and even intravenous injection of the injection devices as well as needle-less air-blast injection devices may be useful. Percutaneous administration is also meant to include surface treatment of the animal by dipping (drenching), pour-on, spraying, or dusting. As illustrated in the working examples hereinafter, systemic control is observed from surface treatments of the acyl urea compounds of formula 1.

Sustained action of the acyl urea compounds of formula 1 can be obtained by formulating the acyl urea

compound in a matrix which will physically inhibit dissolution. The formulated matrix is injected into the body where it remains as a depot from which the compound slowly dissolves. Matrix formulations, now well known in the art, can be formulated in waxy semisolids such as vegetable waxes and high molecular weight polyethylene glycols.

Even more effective sustained action may be obtained by introducing into the animal an implant containing one of the acyl urea compounds of formula 1. Such implants are well known in veterinary art. Such administration can be highly economical and efficacious, because a properly designed implant maintains a constant concentration of the acyl urea compound in the tissues of the host animal. An implant can be designed to supply the acyl urea compound for several months, and can easily be inserted in the animal. No further handling of the animal or concern over the dosage is necessary after the insertion of the implant.

Percutaneous administration of formula 1 acyl urea compounds may be carried out in the ways usual in the animal veterinary art. For example, it may be practical to formulate an injectable suspension of the acyl urea compound as a fine powder, suspended in a formulation of physiologically-acceptable liquid carriers, surfactants, and suspending agents.

The liquid carriers can be, for example, a vegetable oil such as peanut oil, corn oil, or sesame oil, a glycol such as a polyethylene glycol, or water, depending on the acyl urea compound chosen.

Suitable physiologically acceptable adjuvants may be necessary to keep the acyl urea compound of formula 1 suspended. The adjuvants can be chosen from among the emulsifiers, such as salts of dodecylbenzene sulfate and toluenesulfonate, ethylene oxide adducts of alkylphenol, and oleate and laurate esters, and from the dispersing agents such as salts of naphthalenesulfonate, lignin sulfonate and fatty alcohol sulfates. Thickeners such as carboxymethyl cellulose, polyvinylpyrrolidone, gelatin and the alginates may also be used as adjuvants for injectable suspensions. Many classes of surfactants, as well as those which have been discussed above, serve to suspend the acyl urea compound. For example, lecithin and the polyoxyethylene sorbitan esters may be useful surfactants.

The acyl urea compounds used in the method of this invention can be administered to the animal directly in an undiluted form or the active compound may be formulated with a suitable carrier prior to use. A suitable carrier for purposes of this invention is a carrier which will have no deleterious effect on the animal being treated or on the method or results of the invention. The carrier can be either solid or liquid depending upon the compound and method of administration selected by one skilled in the art. Suitable liquid carriers include water, N-methylpyrrolidone, vegetable oil, and other non-toxic liquid carriers with or without surfactants. Liquid concentrates can be prepared by dissolving one of the active compounds with a non-toxic solvent and dispersing the toxicants in water with the aid of suitable surface active emulsifying and dispersing agents. The choice and quantity of dispersing and emulsifying agents employed is dictated by the ability of the agent to facilitate dispersion of the toxicant. For a solid formulation such as a powder, tablet, paste, or the like, the active ingredient is dispersed in and on an appropriate carrier such as clay, talc, or dry molasses.

Formulations useful in the conduct of the method of this invention can also contain other optional ingredients such as stabilizers or other biologically active compounds, insofar as they do not impair or reduce the activity of the compounds towards the parasites and do not harm the animal being treated.

The formulation of veterinary additives in animal feed is an extremely well-known art. It is usual to formulate the compound first as a premix in which the acyl urea compound of formula 1 is dispersed in a liquid or particulate solid carrier. The premix may conveniently contain from about 1 to 400 grams of compound per pound of carrier, depending on the desired concentration of the feed.

The premix is in turn formulated into feed by dispersing it in the feed mixture in a conventional mixer. The correct amount of acyl urea compound, and hence of premix, to mix in the feed can be easily computed by taking into account the weight of the animals, the approximate amount each animal eats per day, and the concentration of the compound in the premix.

Likewise, the amount of acyl urea compound to administer in the drinking water of animals can be computed by taking into account the animal's weight and the amount each animal drinks per day. It is convenient to use a suspendable formulation of the desired acyl urea compound. The formulation may be a suspension in the concentrated form which is mixed into the drinking water, or may be a dry preparation which is mixed with and suspended in the drinking water. In either event, the acyl urea compound should be in a finely powdered form. The acyl urea compounds can easily be formulated into tablets and capsules according to the conventional methods known in the art. Drench formulations comprise the acyl urea compound dissolved or dispersed in an aqueous liquid mixture. It is convenient and efficacious to use a dispersion of the acyl urea compound made in the same way that the drinking water formulations discussed above are made.

It is appreciated that the acyl urea compounds of generic formula 1 may be used in combination with each other and/or with one or more biologically active materials, e.g., medicinal drugs, vertebrate toxicants, growth promoters, vitamins, minerals, etc., known in the veterinary art. Such combinations may be used for the known or other purpose of each ingredient and may provide a synergistic effect. The combinations may be administered according to the known or other methods for administering the biologically active materials, e.g., orally, implant, pour-on, injection, etc.

Illustrative of medicinal drugs known in the veterinary art which may be used in combination with the acyl urea compounds of formula 1 include, for example, the following: benzylbenzoate+lindane; benzylbenzoate; chloroform+rotenone; caraway oil+petrolatum; chlordane; chlorpyrifos; crotoxyphos+dichlorvos; coumaphos; diazinon; dichlorvos; dimethoate; dioxathion; famophos; fenthion; calcium polysulfide; lindane; malathion; methoprene; methoxychlor; benzylbenzoate+lindane+chlorobutanol+phenylmercuric chloride; naled; nicotine sulfate; phosmet; pyrethrins; synergized pyrethrins such as piperonyl butoxide and the like; stabilene, MGK 11 or MGK 326; stirofos+dichlorvos; ronnel; rotenone; stirofos; amicarbalide diisethionate; amprolium; decoquinate; carbarsone; dimetridazole; diminazine acetate; ethidium bromide; furazolidone; homidium bromide; imidocarb dipropionate; isometamidium; lasalocid; nitrasone; pamaquine naphtho-

Illustrative of vertebrate toxicants known in the veterinary art which may be used in combination with the acyl urea compounds of formula 1 include, for example, the following: coumafuryl; pivalin; warfarin; dicumarol; coumachlor; coumatetralyl; chlorophacinon; diphenacoum; bromethacoum; bromethalin; brodifacoum; bromodiolone+sulpha quinoxaline; bromodiolone; calciferol; calciferol+any anticoagulant such as difenacoum; calcium carbide; calcium phosphide; alpha-chloralose; chlorophacinone; chloropicrin; cholecalciferol; coumafuryl; coumatetralyl; crimidine; difenacoum; endrin; floxacetamide; lindane+teenazine+thiourea; acetylsalicylic acid+any anticoagulant such as difenacoum; pindone+warfarin; pyranocoumarin; scilliroside and toxic extracts of *Urginea*; strychnine; thalium sulfate; and zinc phosphide. Such combinations may be administered, for example, as a bait or tracking

powder in which an undesirable vertebrate host can be eliminated by the toxicant and, at the same time, any ectoparasites from the dead vertebrate host can be killed and prevented from moving to infect man or his domestic animals by the systemic action of the acyl urea compound.

Illustrative of growth promoters known in the veterinary art which may be used in combination with the acyl urea compounds of formula 1 include, for example, the following: 2,4-dihydro-6-phenyl-1H-s-triazolo[4,3-a][1,4] benzodiazepin-1-ones as described in U.S. Pat. No. 3,786,149; 2,3-dibromopropanol as described in U.S. Pat. No. 3,934,037; tertiary alcohols and their urea, ureide, oxyurea and carbamate derivatives as described in U.S. Pat. No. Re. 28,691; tropine benzohydril ether or 3-quinuclidinyl benzohydril ether as described in U.S. Pat. No. 3,978,221; polyhaloaldehyde aldol condensation products as described in U.S. Pat. No. 3,755,601; nitroxazide as described in U.S. Pat. No. 4,093,747; phenylalkylsulfamide derivatives as described in U.S. Pat. No. 3,860,723; quinoxalinedi-N-oxides as described in U.S. Pat. No. 4,012,512; imines of quinoxalinedi-N-oxides as described in U.S. Pat. Nos. 3,997,665, 3,983,235, 3,984,553, 3,984,550, 3,984,547 and 3,983,236; streptomycetes antibiotics including avermectin, ivermectin, milbemycin, valinomycin and the like as described in U.S. Pat. No. Re. 28,700 and U.S. Pat. Nos. 4,083,964, 3,950,515, 4,073,884, and 3,790,667; mixtures of mocimycin and bacitracin as described in U.S. Pat. No. 3,928,573; vancomycin, ristocetin and physiologically acceptable salts and esters thereof as described in U.S. Pat. No. 3,928,571; dibenzazepines as described in U.S. Pat. No. 3,812,255; hydroxyphenethanol amines as described in U.S. Pat. No. 3,818,101; bromo FES derivatives and chloro FES derivatives as described in U.S. Pat. Nos. 3,751,431 and 3,764,614; tetrahydroiminobenzo [G] thien-4-ylureas as described in U.S. Pat. No. 4,060,627; pyrazoles as described in U.S. Pat. No. 3,980,794; thiolcarbamates as described in U.S. Pat. No. 3,781,440; iodonium salts as described in U.S. Pat. No. 4,087,554; 3-nitro-pyrazole-gamma-carboxylic acid nitrofurfurylidene hydrazides as described in U.S. Pat. No. 4,235,995; macrotrolidides such as nonactin, monactin, dinastin trinactin, tetranactin, polynactin and the like as described in DE 2835936 A 790222 79091; penicillin, cephalosporin and analogs thereof as described in DE 7932285A 790125 79051; and spiramycin and acid esters thereof as described in DE 861603A 780607 78241.

Illustrative of vitamins known in the veterinary art which may be used in combination with the acyl urea compounds of formula 1 include, for example, vitamins A, B, C, D, E, thiamine and the like.

Illustrative of essential minerals known in the veterinary art which may be used in combination with the acyl urea compounds of formula 1 include, for example, sodium, calcium, magnesium, copper, zinc, cobalt, phosphorous, sulfur, chlorine, iodine and the like.

It is understood that the above biologically active materials are merely representative of a wide variety of materials that can be combined with the acyl urea compounds of formula 1 for use in the method of this invention.

The inherent low mammalian toxicity of these compounds by all routes of entry makes them ideally suited for medical and veterinary parasite control. There may also be a reduced probability of pest resistance developing to this chemical class relative to compounds which

are dependent upon cholinesterase-inhibition. When administered orally, by pour-on, by implant, or by injection, the costly expense of spray equipment and labor for spraying are eliminated. Problems associated with coverage and penetration of feathers or hair are also avoided.

The method of this invention including the preparation of acyl urea compounds of formula 1 utilized therein is illustrated by the following examples.

EXAMPLE I

Preparation of

1-[3-chloro-4-(4-chloro-1-naphthoxy)-2,5-dimethylphenyl]-3-(2-chlorobenzoyl)urea

Part A

Preparation of

3-chloro-4-(4-chloro-1-naphthoxy)-2,5-dimethyl-1-nitrobenzene

Into a solution containing 9.10 grams (51.1 mmol) of 4-chloro-1-naphthol and 10.12 grams (46.0 mmol) of 3-chloro-2,5-dimethyl-1-nitrobenzene in 22 milliliters of dimethylsulfoxide at room temperature and under a nitrogen atmosphere was added 8.89 grams (64.4 mmol) of anhydrous potassium carbonate. The resulting mixture was heated to a temperature of 130° C. and maintained at that temperature for a period of 6 hours. The reaction mixture was then filtered and the filtrate was diluted with 20 milliliters of methanol and allowed to cool to room temperature. Crystallization occurred during this cooling period. The filtrate was further cooled in an ice bath, filtered and the collected crystals washed with cold methanol. Recrystallization from a hexane-ethyl acetate mixture afforded 7.92 grams of 3-chloro-4-(4-chloro-1-naphthoxy)-2,5-dimethyl-1-nitrobenzene as a white solid having a melting point of 135° C.-137° C.

Part B

Preparation of

3-chloro-4-(4-chloro-1-naphthoxy)-2,5-dimethylaniline

Into a solution containing 13.8 grams (38.1 mmol) of 3-chloro-4-(4-chloro-1-naphthoxy)-2,5-dimethyl-1-nitrobenzene prepared in Part A in 400 milliliters of toluene was added 2.0 grams of a 5% platinum on carbon catalyst. The resulting mixture was placed in a one liter rocking Parr hydrogenation vessel. Hydrogen was introduced into the vessel to a pressure of 120 psi. The hydrogen pressure was maintained between 100-120 psi until hydrogen uptake ceased. The contents of the reactor vessel were then removed and filtered. Removal of the solvents from the filtrate afforded 11.6 grams of 3-chloro-4-(4-chloro-1-naphthoxy)-2,5-dimethylaniline as a white solid having a melting point of 118° C.-125° C.

Part C

Preparation of

1-[3-chloro-4-(4-chloro-1-naphthoxy)-2,5-dimethylphenyl]-3-(2-chlorobenzoyl)urea

Into a solution containing 3.0 grams (9.0 mmol) of 3-chloro-4-(4-chloro-1-naphthoxy)-2,5-dimethylaniline prepared in Part B in 25 milliliters of toluene which solution was warmed to a temperature of 50° C. and placed under a nitrogen atmosphere was slowly added a solution containing 2.5 grams (13.8 mmol) of 2-chlorobenzoyl isocyanate in 5 milliliters of toluene. After stir-

ring for 1 hour at a temperature of 50° C., the reaction mixture was cooled to room temperature, placed in an ice bath, and filtered through a Buchner funnel. The collected solid was dried under vacuum at a temperature of 50° C. to afford 3.15 grams of 1-[3-chloro-4-(4-chloro-1-naphthoxy)-2,5-dimethylphenyl]-3-(2-chlorobenzoyl)urea as a white solid having a melting point of 187° C. Elemental analysis of the white solid indicated the following:

Analysis: $C_{26}H_{19}Cl_3N_2O_2$; Calculated: C, 60.77; H, 3.73; N, 5.45, Found: C, 60.82; H, 3.76; N, 5.76.

This compound is referred to hereinafter as Compound 1.

EXAMPLE II

Preparation of

1-[3-chloro-4-(4-chloro-1-naphthoxy)-2,5-dimethylphenyl]-3-(2,6-difluorobenzoyl)urea

Into a solution containing 3.0 grams (9.0 mmol) of 3-chloro-4-(4-chloro-1-naphthoxy)-2,5-dimethylaniline prepared in Part B of Example I in 25 milliliters of toluene which solution was warmed to a temperature of 50° C. and placed under a nitrogen atmosphere was slowly added a solution containing 2.5 grams (13.5 mmol) of 2,6-difluorobenzoyl isocyanate in 5 milliliters of toluene. After stirring for one hour at a temperature of 50° C., the reaction mixture was cooled to room temperature, placed in an ice bath, and filtered through a Buchner funnel. The collected solid was dried under a vacuum at a temperature of 50° C. to afford 2.89 grams of 1-[3-chloro-4-(4-chloro-1-naphthoxy)-2,5-dimethylphenyl]-3-(2,6-difluorobenzoyl)urea as a white powder having a melting point of 187° C. Elemental analysis of the white powder indicated the following:

Analysis: $C_{26}H_{18}Cl_2F_2N_2O_3$; Calculated: C, 60.59; H, 3.52; N, 5.44, Found: C, 59.95; H, 3.28; N, 6.19.

This compound is referred to hereinafter as Compound 2.

EXAMPLE III

Preparation of

1-[3-chloro-4-(2,4-dimethylphenoxy)-2,5-dimethylphenyl]-3-(2,6-difluorobenzoyl)urea

Part A

Preparation of

4-(2,4-dimethylphenoxy)-2,5-dimethyl-3-chloronitrobenzene

Into a round bottom reaction flask equipped with a magnetic stirrer, condenser, thermometer and nitrogen inlet was added 50.0 grams (0.23 mol) of 2,5-dimethyl-3,4-dichloronitrobenzene, 38.5 grams (0.32 mol) of 2,4-dimethylphenol, 50 grams (0.36 mol) of potassium carbonate and 125 milliliters of dimethylformamide. The reaction mixture was heated to a temperature of 90° C.-100° C. and maintained at this temperature for a period of 72 hours. The reaction mixture was then cooled, filtered and concentrated to give a dark oil. The dark oil was partitioned between toluene (300 milliliters) and 4% sodium hydroxide (250 milliliters) and then separated. The organic layer was washed with water and brine, dried over Na_2SO_4 and concentrated to give a dark oil. The dark oil was triturated with hexane and a solid was formed. The solid was washed with cold hexane and vacuum dried to give 47.8 grams (0.16 mol) of 4-(2,4-dimethylphenoxy)-2,5-dimethyl-3-chloronitrobenzene as a tan powder having a melting

point of 78° C.-80° C. Elemental analysis of the tan powder indicated the following:

Analysis: $C_{16}H_{16}ClNO_3$; Calculated: C, 62.85; H, 5.27; N, 4.58, Found: C, 63.47; H, 5.35; N, 4.49.

Part B

Preparation of

4-(2,4-dimethylphenoxy)-2,5-dimethyl-3-chloroaniline

Into a solution of 4-(2,4-dimethylphenoxy)-2,5-dimethylphenyl-3-chloronitrobenzene (25 grams, 81.8 mmol) prepared in Part A in toluene (250 milliliters) was added a 5% platinum on carbon catalyst (1.0 gram). The resulting mixture was placed in a one liter rocking Parr hydrogenation vessel. Hydrogen was introduced into the vessel to a pressure of 20 psi and maintained at this pressure for a period of 4.5 hours. The contents of the reactor vessel were then removed, filtered through celite and concentrated to give 24.5 grams of an oil. After high vacuum drying, the oil turned to a pinkish solid which was identified as 4-(2,4-dimethylphenoxy)-2,5-dimethyl-3-chloroaniline having a melting point of 86° C.-88° C. Elemental analysis of the solid indicated the following:

Analysis: $C_{16}H_{18}ClNO$; Calculated: C, 69.69; H, 6.53; N, 5.08, Found: C, 70.02; H, 6.60; N, 5.68.

Part C

Preparation of

1-[3-chloro-4-(2,4-dimethylphenoxy)-2,5-dimethylphenyl]-3-(2,6-difluorobenzoyl)urea

Into a solution of 4-(2,4-dimethylphenoxy)-2,5-dimethyl-3-chloroaniline (1.75 grams, 6.3 mmol) prepared in Part B in 7 milliliters of toluene, which solution was warmed to a temperature of 50° C., was added 1.14 grams (6.2 mmol) of 2,6-difluorobenzoyl isocyanate in 1.5 milliliters of toluene. The reaction mixture was heated to a temperature of 90° C. and maintained at this temperature for 0.5 hours. After cooling to room temperature, the reaction mixture was diluted with 20 milliliters of hexane and then cooled in an ice bath. A precipitate formed which was collected by filtration and washed with a cold solution of 50% hexane in toluene. After vacuum drying, a white solid (1.26 grams) which was identified as 1-[3-chloro-4-(2,4-dimethylphenoxy)-2,5-dimethylphenyl]-3-(2,6-difluorobenzoyl)urea was obtained having a melting point of 183° C.-185° C. Elemental analysis of the white solid indicated the following:

Analysis: $C_{24}H_{11}N_2O_3ClF_2$; Calculated: C, 62.82; H, 4.61; N, 6.10, Found: C, 62.94; H, 4.88; N, 6.03.

This compound is referred to hereinafter as Compound 3.

EXAMPLE IV

Preparation of

1-[4-(4-chloro-1-naphthoxy)-2,3,5-trichlorophenyl]-3-(2,6-difluorobenzoyl)urea

Part A

Preparation of

4-(4-chloro-1-naphthoxy)-3,5-dichloronitrobenzene

Into a mixture of 3,4,5-trichloronitrobenzene (30.26 grams, 134.0 mmol), anhydrous potassium carbonate (28.02 grams, 203.0 mmol) and dimethylformamide (300 milliliters) was added solid 4-chloronaphthol (30.04 grams, 168.0 mmol). The mixture was stirred under a nitrogen atmosphere and heated overnight at a tempera-

ture of 105° C. The mixture was then allowed to cool and the dimethylformamide was evaporated under reduced pressure. The residue was dissolved in 1:1 ethyl acetate:ethyl ether (1.5 liters) and washed sequentially with water, 5% NaOH solution, water and brine. The organic layer was dried over Na₂SO₄ and concentrated under reduced pressure to afford a crude product as a dark brown solid (48.73 grams). Decolorization with carbon and recrystallization (2x) from hexane:ethyl acetate afforded pure 4-(4-chloro-1-naphthoxy)-3,5-dichloronitrobenzene (15.84 grams, 42.98 mmol, 32%) as a yellow solid having a melting point of 121.5° C.-123° C. This material was characterized by ¹H-NMR spectroscopy as follows: ¹H-NMR (CDCl₃) 8.70-8.10 (m, 2H), 8.38 (s, 2H), 7.90-7.50 (m, 2H), 7.33 (d, J=9 Hz, 1H), 6.25 (d, J=9 Hz, 1H).

Part B

Preparation of 4-(4-chloro-1-naphthoxy)-3,5-dichloroaniline

Into a 500 milliliter Parr bottle was charged 4-(4-chloro-1-naphthoxy)-3,5-dichloronitrobenzene (15.84 grams, 42.97 mmol) prepared in Part A and toluene (250 milliliters). The bottle was purged thoroughly with nitrogen and 5% platinum on carbon (0.50 grams) was added immediately following the purge. The reaction mixture was then hydrogenated for 1.5 hours on a rocking Parr hydrogenator at a pressure of 90-100 psi hydrogen at ambient temperature. The reaction mixture was filtered through a pad of celite and the filtrate concentrated under reduced pressure to afford pure 4-(4-chloro-1-naphthoxy)-3,5-dichloroaniline (13.99 grams, 41.31 mmol, 96%) as a white solid having a melting point of 145° C.-147° C. Elemental analysis of the white solid indicated the following:

Analysis: C₁₆H₁₀Cl₃NO; Calculated: C, 56.75; H, 2.98; N, 4.14, Found: C, 56.96; H, 2.94; N, 4.14.

Part C

Preparation of 4-(4-chloro-1-naphthoxy)-2,3,5-trichloroaniline

Into a magnetically stirred solution of 4-(4-chloro-1-naphthoxy)-3,5-dichloroaniline (6.00 grams, 17.72 mmol) prepared in Part B in benzene (50 milliliters) was added solid N-chlorosuccinimide (2.84 grams, 21.20 mmol). The mixture was heated to reflux for 1 hour, cooled and filtered. The solvent was evaporated under reduced pressure and the crude product when subjected to flash column chromatography (3:1 hexane:ethyl acetate) afforded pure 4-(4-chloronaphthoxy)-2,3,5-trichloroaniline (3.70 grams, 9.92 mmol, 56%). Elemental analysis of the product indicated the following:

Analysis: C₁₆H₉Cl₄NO; Calculated: C, 51.51; H, 2.43; N, 3.75, Found: C, 51.78; H, 2.49; N, 3.69.

Part D

Preparation of 1-[4-(4-chloro-1-naphthoxy)-2,3,5-trichlorophenyl]-3-(2,6-difluorobenzoyl)urea

Into a magnetically stirred solution of 4-(4-chloro-1-naphthoxy)-2,3,5-trichloroaniline (1.60 grams, 4.29 mmol) prepared in Part C in dichloromethane (20 milliliters) was added neat 2,6-difluorobenzoyl isocyanate (786 milligrams, 4.29 mmol). The heterogeneous mixture was stirred at room temperature for about 15 minutes and then chilled to a temperature of 0° C. The precipitate was collected on a fritted disc and washed

with 3:1 hexane:ethyl acetate to afford pure 1-[4-(4-chloro-1-naphthoxy)-2,3,5-trichlorophenyl]-3-(2,6-difluorobenzoyl) urea (1.9 grams, 3.41 mmol, 80%) as a white powder having a melting point of 213° C.-215° C. Elemental analysis of the white powder indicated the following:

Analysis: C₂₄H₁₂Cl₄F₂N₂O₃; Calculated: C, 51.83; H, 2.17; N, 5.04, Found: C, 51.41; H, 2.54; N, 4.91.

This compound is referred to hereinafter as Compound 4.

EXAMPLE V

Preparation of 2-(2-chlorobenzoyl)-3-[3-chloro-4-(4-chloro-1-naphthoxy)-2,5-dimethylphenyl]-1,1-dimethylguanidine

Part A

Preparation of 1-(2-chlorobenzoyl)-3-[3-chloro-4-(4-chloro-1-naphthoxy)-2,5-dimethylphenyl]-S-methylisothiourea

Into a solution containing 21.2 grams of 1-[3-chloro-4-(4-chloro-1-naphthoxy)-2,5-dimethylphenyl]-3-(2-chlorobenzoyl)thiourea and 200 milliliters of dry tetrahydrofuran under an atmosphere of nitrogen and cooled to 10° C. was added 6.3 milliliters (6.4 grams) of 1,8-diazabicyclo[5.4.0] undec-7-ene. The resulting solution was warmed to room temperature and stirred for 20 minutes. After cooling the resultant mixture to a temperature of 10° C., 2.5 milliliters (5.7 grams) of methyl iodide was added. After 5 minutes at 10° C., the mixture was warmed to room temperature, stirred for 2 hours, and then poured into 500 milliliters of ethyl acetate. This solution was washed twice with water and the organic layer dried over anhydrous sodium sulfate. Removal of the solvents afforded 21.14 grams of an orange solid. Recrystallization of the orange solid using a hexane-ethyl acetate mixture afforded 11.29 grams of 1-(2-chlorobenzoyl)-3-[3-chloro-4-(4-chloro-1-naphthoxy)-2,5-dimethylphenyl]-S-methylisothiourea as white crystals having a melting point of 165° C.-168° C. Elemental analysis of the white crystals indicated the following:

Analysis: C₂₇H₂₁Cl₃N₂O₂S; Calculated: C, 59.62; H, 3.89; N, 5.15, Found: C, 59.87; H, 3.89; N, 5.02.

Part B

Preparation of 2-(2-chlorobenzoyl)-3-[3-chloro-4-(4-chloro-1-naphthoxy)-2,5-dimethylphenyl]-1,1-dimethylguanidine

A mixture containing 5.0 grams of 1-(2-chlorobenzoyl)-3-[3-chloro-4-(4-chloro-1-naphthoxy)-2,5-dimethylphenyl]-S-methylisothiourea prepared in Part A, 25 milliliters of tetrahydrofuran, 10 milliliters of ethanol and 50 milliliters of a 40% aqueous dimethylamine solution was refluxed in a nitrogen atmosphere for 5 hours. An additional 25 milliliters of 40% aqueous dimethylamine solution was added and reflux was continued for an additional 16 hours. After cooling to room temperature, the mixture was poured into 200 milliliters of water. This aqueous mixture was extracted twice with methylene chloride and twice with ethyl acetate. The combined extracts were dried over anhydrous sodium sulfate. Removal of the solvents afforded 3.97 grams of a crude material. Chromatography of the crude material on silica gel using 9:1 ethyl acetate:methanol for elution afforded 1.87 grams of 2-(2-chlorobenzoyl)-3-[3-chloro-4-(4-chloro-1-naphthoxy)-2,5-dimethylphenyl]-1,1-

dimethylguanidine as an amorphous solid having a melting point of 85° C.-97° C. Elemental analysis of the amorphous solid indicated the following:

Analysis: C₂₈H₂₄Cl₃N₃O₂; Calculated: C, 62.18; H, 4.47; N, 7.77, Found: C, 62.10; H, 4.22; N, 8.00.

This compound is referred to hereinafter as Compound 49.

EXAMPLE VI

Preparation of 1-(4-tert-butyl(dimethylsiloxy)-3,5-dichlorophenyl)-3-(2,6-difluorobenzoyl)urea

Into a homogeneous solution of 1-(3,5-dichloro-4-hydroxyphenyl)-3-(2,6-difluorobenzoyl)urea (3.13 grams, 8.66 mmol) in dimethylformamide (25 milliliters) was added triethylamine (1.75 grams, 17.3 mmol), and the resulting mixture was stirred for 5 minutes. Tertiary-butyl(dimethylsilyl) chloride (3.92 grams, 26.0 mmol) was then added, and a thick precipitate formed immediately. This heterogeneous mixture was then diluted with ethyl acetate (200 milliliters), washed with saturated sodium bicarbonate (twice with 150 milliliters) and then washed with a brine solution (150 milliliters). The organic layer was dried over sodium sulfate, filtered, and concentrated under reduced pressure to give a brown solid. The solid was washed with cold ether and vacuum dried to afford 1-(4-tert-butyl(dimethylsiloxy)-3,5-dichlorophenyl)-3-(2,6-difluorobenzoyl)urea (2.71 grams, 5.70 mmol) having a melting point of 184° C.-186° C. Elemental analysis of the product indicated the following:

Analysis: C₂₀H₂₂Cl₂F₂N₂O₃Si; Calculated: C, 50.52; H, 4.66; N, 5.89, Found: C, 50.47; H, 4.71; N, 5.69.

This compound is referred to hereinafter as Compound 45.

EXAMPLE VII

In a manner similar to that employed in the preceding examples, other urea compounds were prepared. Compounds 5, 6, 7, 14, 18, 21, 22, 23, 29, 32, 33, 34, 39, 43, 48, 68, 78 and 85 were prepared in a manner similar to that employed in Examples I and II for the preparation of Compounds 1 and 2 respectively. Compounds 8, 10, 12, 15, 24, 28, 55, 56, 57, 58, 61, 62, 63, 71, 73, 74, 76, 77, 87, 89, 90, 91, 92, 93 and 98 were prepared in a manner similar to that employed in Example III for the preparation of Compound 3. Compound 79 was prepared in manner similar to that employed in Example V for the preparation of Compound 49. Compounds 25, 37, and 41 were prepared in a manner similar to the procedure described in U.S. patent application Ser. No. 480,697, filed Mar. 31, 1983. Compound 19 was prepared in a manner similar to the procedure described in U.S. Pat. No. 4,521,426. Compound 26 was prepared in a manner similar to the procedure described in U.S. patent application Ser. No. 712,197, filed Mar. 15, 1985. Compounds 30, 53, 64, 94, 95, 96, 97 and 99 were prepared in a manner similar to the procedure described in U.S. patent application Ser. No. 781,382, filed Sep. 30, 1985. Compounds 69 and 72 were prepared in a manner similar to the procedure described in U.S. patent application Ser. No. 672,007, filed Nov. 15, 1984. Compound 65 was prepared in a manner similar to the procedure described in U.S. patent application Ser. No. 686,735, filed Dec. 27, 1984.

The following compounds were prepared in a manner similar to that described in the indicated publication: Compound 16 (U.S. Pat. No. 3,748,356); Compound 36 (U.S. Pat. No. 3,748,356); Compound 47 (U.S. Pat. No. 3,748,356); Compound 17 (U.S. Pat. No. 4,275,077); Compound 20 (U.S. Pat. No. 4,275,077);

Compound 27 (U.S. Pat. No. 4,457,943); Compound 31 (U.S. Pat. No. 4,139,636); Compound 9 (U.S. Pat. No. 4,041,177); Compound 88 (U.S. Pat. No. 4,005,223); Compound 35 (EP 72,438); Compound 54 (EP 69,288); Compound 59 (EP 72,438); Compound 46 (U.S. Pat. No. 4,212,870); Compound 75 (U.S. Pat. No. 4,162,330); Compound 80 (U.S. Pat. No. 4,162,330); Compound 11 (U.S. Pat. No. 4,173,637); Compound 13 (U.S. Pat. No. 4,173,637); and Compound 60 (Japan 56 092857).

The following intermediate anilines and aromatic amines were prepared in a manner similar to that described in the indicated publication, and were then reacted with the appropriate benzoyl isocyanate according to the procedure employed in Example II above: 5-amino-3-methyl-1,2,4-oxadiazole described in U.S. Pat. No. 3,917,478 (Compound 82); 2-amino-5-(1-naphthyl) methylthio-1,3,4-thiadiazole described in German Patent 1,079,060 (Compound 38); 5-(4-nitrophenyl)-3-trifluoromethyl-1,2,4-oxadiazole described in U.S. Pat. No. 3,917,478 (Compound 50) in which the reduction conditions of Example I, Part B above were used to prepare the corresponding aniline; 1-chloro-4-nitronaphthalene described in Bassilios, *Bull. Soc. Chim. Fr.*, 1951, 651 in which catalytic reduction (Example I, Part B above) afforded 1-amino-4-chloronaphthalene (Compound 40); 1-chloro-4-nitronaphthalene was converted into 1-amino-4-(2,4-dimethylphenoxy) naphthalene according to U.S. patent application Ser. No. 495,331, filed May 20, 1983 (Compound 42); 9-nitroanthracene was reduced using the procedure described in Example I, Part B above (Compound 44); 1-amino-4-chloro-5,6,7,8-tetrahydronaphthalene described in Press and Hoffman, *Org. Prep. Proc. Int.*, 1982, 14,204 and Simonetta Beltrane, *Gazz. Chim. Ital.*, 1958, 88,769 (Compound 70); 3,5-dichloro-4-[4-chloro-1-naphthoxy]butoxy] aniline and 4-[1-(1-naphthyl)ethoxy] aniline described in U.S. patent application Ser. No. 430,368, filed Sep. 30, 1982 (Compounds 66 and 81); 1,1-bis-(4-chlorophenyl)methylamine and alpha-methyl-4-chlorobenzylamine described in Cram and Guthrie, *J. Am. Chem. Soc.*, 1966, 88, 5760 (Compounds 83 and 84); and alpha-amino-4-chlorophenylacetonitrile described in Stevens et al., *J. Chem. Soc.*, 1931, 2568 (Compound 86). Compounds 51 and 52 were prepared from commercially available anilines or amines according to the procedure employed in Example II above.

Compound 67 was prepared according to the procedure described in Example II above. The aniline used in this procedure was prepared as follows: A mixture containing 32.81 grams of 3-chloro-2,5-dimethyl-4-(2,4-dimethylphenoxy)aniline, 36.40 grams of methyl bromoacetate, 16.44 grams of anhydrous potassium carbonate and 240 milliliters of toluene was heated to reflux for 66 hours. The reaction mixture was then cooled to room temperature, diluted with 700 milliliters of ethyl acetate, and washed with 400 milliliters of water and 400 milliliters of brine solution. The organic layer was dried over anhydrous sodium sulfate and the solvents removed under reduced pressure. The residue was triturated with hexane to afford 28.32 grams of methyl N-[3-chloro-2,5-dimethyl-4-(2,4-dimethylphenoxy)phenyl] glycinate as an off white solid. ¹H-NMR(CDCl₃): 8.12(s, 3H), 2.28(s, 3H), 2.31(s,3H), 2.37(s,3H), 3.81(s,3H), 3.97(s,2H), 6.17(d, J=8 Hz,1H), 6.29(s,1H), 6.78(d of d; J=8, 2 Hz, 1H), 7.01(broad d, J=2 Hz,1H).

The structure and analytical data for Compounds 1 through 99, which compounds are used in the examples hereinafter for controlling certain endoparasites and ectoparasites of warm-blooded animals, are set forth in Table 1 below:

EXAMPLE VIII

Systemic Control of Northern Fowl Mite

(Ornithonyssus sylviarum)

White Leghorn laying hens housed in commercial egg laying cages were preinfested with northern fowl mites 3 weeks prior to being fed the treated feed. The feed was prepared by dissolving Compound 1 (technical grade) in soybean oil and blending the solution with a standard poultry ration. An untreated blank was prepared by blending soybean oil alone with the ration. Twenty birds received feed treated with 500 ppm of Compound 1 and 20 birds received the soybean oil (control). Birds were maintained on the rations for 5 consecutive weeks. Mite counts on each bird were made at weekly intervals, and the number of mites expressed according to the standard index: 0=no mites, 1=1 to 10 mites, 2=11 to 50 mites, 3=50 to 100 mites, 4=100 to 500 mites, 5=500 to 1,000 mites, 6=1,000 to 10,000 mites, 7 \geq 10,000 mites.

Results presented in Table 2 show that mite populations on birds receiving feed treated with Compound 1 declined rapidly with most birds free of mites after 3 weeks of feeding. Untreated birds remained heavily infested throughout the trial. At the end of 5 weeks, mite-infested control birds maintained on untreated feed were switched to feed treated with the title compound. As before, mite-free birds were produced in 3 weeks (Table 3).

When the experiment was repeated using Compound 1 at a lower feed additive concentration (50 ppm), a similar result occurred (Table 4). Treated feed for this trial was prepared by mixing dry formulated wettable powder directly with the feed. The dry formulated wettable powder was prepared by uniformly mixing the following ingredients (percentages are all by weight):

Compound 1	30%
Aluminum silicate (Englehard ASP-172)	54
ICI MX 2026 (a nonionic/ionic surfactant blend, ICI Americas, Inc.)	8
Talc clay	5
Ethylene oxide condensate of hydrophobic bases (Tergitol NP)	2
Diocetyl sodium sulfosuccinate	1

-continued

(Aerosol OTB)

This mixture was then finely pulverized and remixed by mechanical or air-attrition grinding to obtain the desired wettable powder.

EXAMPLE IX

Systemic Control of Northern Fowl Mite

(Ornithonyssus sylviarum)

The experiment described in Example VIII was conducted using Compound 2 in concentrations of 50 ppm and 5 ppm. Treated feed for this trial was prepared by mixing dry formulated wettable powder of Compound 2 directly with the feed. The dry formulated wettable powder was prepared by uniformly mixing the following ingredients (percentages are all by weight):

Compound 2	26.5%
Kaolin clay	61.2
Alkylaryl sulfonate (Nacconol 90F)	4.0
Silica clay (Zeolex 7)	4.0
Diocetyl sodium sulfosuccinate (Aerosol OTB)	2.0
Sodium naphthalene formaldehyde condensate (Morwet D425)	2.0
Citric acid	0.3

This mixture was then finely pulverized and remixed by mechanical or air-attrition grinding to obtain the desired wettable powder.

Similar results as occurred in Example VIII were observed (Table 5) using the same mite index as in Example VIII. After 4 weeks the birds receiving Compound 2 in their feed were virtually free of mites even at 5 ppm of Compound 2. Untreated birds remained heavily infested with mites throughout the test period.

EXAMPLE X

Systemic Control of Northern Fowl Mite on Chickens

White Leghorn pullets (20 weeks old at beginning of this experiment) of the Hy-Line strain were preinfested with northern fowl mites 3 weeks prior to being fed the treated feed. The infested birds were housed two per standard commercial cage with two cages per treatment (four birds) and the untreated controls. Each group of birds was provided with the corresponding treated feed continuously during the 4 weeks of each test. The feed was prepared by suspending one of the compounds (technical grade) identified in Tables 6 and 7 below in ethanol and then spraying the solution onto a standard poultry ration to provide 200 ppm of active ingredient (by weight). An untreated blank was prepared by blending ethanol alone with the ration. Mite counts on each bird were made at weekly intervals, and the number of mites expressed according to the standard index described hereinabove. The results are set for in Tables 6 and 7 below.

EXAMPLE XI

Pass-through Effects on Pests in Poultry Manure

Concurrent with monitoring feed additive effects of Compounds 1 and 2 on northern fowl mite, manure from the treated and untreated hens of Examples VIII and IX was collected to determine its toxicity to developing larvae of the house fly (*Musca domestica*). House fly eggs used in these tests were from a laboratory colony established from field-caught flies within a year of the test.

Manure collections were made by suspending plastic covered boards below the cages at intervals throughout the feeding studies of Examples VIII and IX. Samples were then placed in plastic cups with screen lids and inoculated with 50 fly eggs per cup. Adult fly emergence was monitored over a period of 10–30 days. Also measured was the residual toxicity of manure after treated birds were returned to untreated feed (flushing effect).

Table 8 presents the results of the treated feed pass-through tests. Manure from birds fed Compound 1 or Compound 2 in their feed was highly toxic to house fly larvae. Few adults emerged from the droppings of the treated birds whereas a substantial percentage of adults emerged from the manure of the untreated birds.

EXAMPLE XIV

Systemic Control of Cattle Lice

Systemic and direct contact action were evaluated against cattle lice on cattle naturally infested with cattle lice. Compound 1 was administered orally in the feed, as a wipe-on (pour-on) salve along the backline and as a full-coverage contact spray. Compounds 2 and 3 were administered orally in feed and as a wipe-on (pour-on) salve.

Cattle on feed supplements received 8.85 mg ai/kg body wt/day by blending dry wettable powder formulations into a premix of ground grain, minerals, and salt. The dry wettable powder formulations for Compound 1 and 2 were prepared as described in Example VIII and IX respectively. The dry wettable powder formulation for Compound 3 was prepared by uniformly mixing the following ingredients (percentages are all by weight):

Compound 3	25.0%
Aluminum Silicate (Englehard ASP-172)	64.5
Synthetic Silica (Zeolox 7)	2.0
Citric Acid	0.5
Sodium Naphthalene	2.0
Formaldehyde Condensate (Morwet D425)	
Alkylaryl Sulfonate (Nacconol 90F)	4.0
Diethyl Sodium Sulfosuccinate (Aerosol OTB)	2.0

This mixture was then finely pulverized and remixed by mechanical or air-attrition grinding to obtain the desired wettable powder.

Wipe-on formulations were rubbed into the hair along the backline at a rate of 4 oz. form./animal (35 mg ai/kg) (single application). These formulations were prepared by mixing the following ingredients together in a ball mill to produce the following suspensions (percentages are all by weight):

Compound 1 was additionally applied as a whole-animal contact spray. The spray was prepared by mixing together the following ingredients in a ball mill (all percentages by weight):

Compound 1	15.0%
Methyl pyrrolidone	47.5
Cyclohexanone	14.9
Alttox 3455F (a nonionic/ionic surfactant blend, ICI Americas, Inc.)	13.5
Isophorone	10.0
Butylated Hydroxytoluene	0.1

This mixture is then diluted with water and applied to the animal at 0.03 lb ai/gal (1 gal/animal).

Cattle averaged 430 lb/head. One animal was assigned per treatment with the exception of the control group which contained 2 animals.

Parasite loads were measured before and after treatment at 6 weekly intervals. Separate louse counts were taken from head, shoulder and sides, and tail-rump areas of each animal. The hair was parted using a 5-inch blade along which the number of lice/inch were counted.

Louse counts taken from head, shoulder, side, rump, and tail areas of treated cattle confirm that the compounds moved systemically throughout the animal following ingestion or localized penetration in the area of the pour-on (Table 8). Excellent control of both chewing (*Bovicola bovis*) and sucking (*Linognathus vituli*) lice was achieved within 2-3 weeks of initial treatment by all routes of administration. After 4 weeks the cattle administered Compound 1 or 2 were virtually lice-free whereas the untreated cattle remained heavily infested.

EXAMPLE XV

Systemic Control of Cattle Nematodes

Systemic action was evaluated against cattle nematodes on cattle naturally infested with internal roundworms. Compound 3 was administered orally in the feed and as a wipe-on (pour-on) salve along the backline.

Cattle on feed supplements received 8.85 mg ai/kg body wt/day by blending dry wettable powder formulations into a premix of ground grain, minerals, and salt. The dry wettable powder formulation for Compound 3 was prepared as described in Example XIV.

Wipe-on formulations were rubbed into the hair along the backline at a rate of 4 oz. form./animal (35 mg ai/kg body wt.) (single application). The wipe-on formulation was prepared as described in Example XIV.

Cattle averaged 430 lb/head. One animal was assigned per treatment with the exception of the control group which contained 2 animals.

Parasite loads were measured before and after treatment at 6 weekly intervals. Intestinal roundworms (primarily strongyles) were monitored using a standard salt fecal floatation technique. Walnut-size portions of manure collected from treated animals were placed in paper cups three-fourths full of a saturated salt solution. After stirring, the resultant slurry was filtered through cheese cloth into a shell vial and a coverslip placed over the top. After 20 minutes, the coverslip was removed, placed on a slide and the total number of worm eggs per slide counted under a light microscope. Nematode egg counts from fecal samples are summarized in Table 13. After 4 weeks, the cattle administered Compound 3 exhibited significantly reduced nematode egg counts in comparison with the untreated cattle.

EXAMPLE XVI

Systemic Control of Sarcoptic Mange in Pigs

Systemic action was evaluated against the mite *Sarcoptes scabiei* in pigs infested with the mite. Compound 2 was administered orally in the feed or as a wipe-on (pour-on) salve.

Pigs on feed supplements received 6 mg ai/kg body wt/day by blending dry wettable powder formulations

into the feed. The dry wettable powder formulation for Compound 2 was prepared as described in Example IX.

Wipe-on formulations were rubbed into the back or other area of the animal at a rate of 35 mg ai/kg body wt in a single application. The wipe-on formulations were prepared by mixing the following ingredients together in a ball mill to produce a suspension (percentages are all by weight):

Compound 2	1.9%
Carageenan-based flow modifier*	2.0
Dioctyl sodium sulfosuccinate	0.4
Petroleum crop oil	96.1

Parasitic loads were measured before and after treatment at 3 weekly intervals. Excellent systemic control of the mite was achieved within 1 week of initial treatment by both routes of administration (Table 14).

EXAMPLE XVII

Systemic Control of Rodent Bot Fly

Systemic activity was evaluated against rodent bot fly on *Peromyscus* mice infested with rodent bot fly (*Cuterebra fontinella*). Larval development of this parasite takes place entirely within the body of the host. All compounds identified in Table 15 were administered orally in the feed as part of the daily ration. There were fifteen (15) mice each for the treatments and for the controls. A separate control was used for each treatment. The treated diet was prepared by pulverizing standard laboratory rat chow pellets, dry-incorporating the technical material and repelletizing. The final feeding concentration of each treatment was 200 ppm. Infestation was accomplished by manually placing 3-4 newly hatched bot fly larvae into the eyes of each mouse. Effectiveness was determined by periodically examining the inguinal region of the mouse for breathing holes cut by the migrating bot fly larvae. Further larval development and emergence from the body of the host was also monitored and recorded. All compounds were offered continuously throughout the experiment as well as during a 5-7 day period prior to infestation with the parasite.

The results are set forth in Table 15 below.

EXAMPLE XVIII

Systemic Effect Against Flea Reproduction on Cats

Systemic activity was evaluated against fleas on cats infested with fleas (*Ctenocephalides* spp.). Treated feed for this experiment was prepared by mixing dry formulated wettable powder of the compounds identified in Tables 16 and 17 directly with the feed. The dry formulated wettable powder was prepared by uniformly mixing the following ingredients (percentages are all by weight):

Compound 2 or 8	25.0%
Aluminum Silicate (Englehard ASP-172)	64.5
Synthetic Silica (Zeolex 7)	2.0
Citric Acid	0.5
Sodium Naphthalene Formaldehyde Condensate (Morwet D425)	2.0
Alkylaryl Sulfonate (Nacconol 90F)	4.0
Diocetyl Sodium Sulfosuccinate (Aerosol OTB)	2.0

This mixture was then finely pulverized and remixed by mechanical or air-attrition grinding to obtain the desired wettable powder. The wettable powders were mixed into a portion of the daily ration (10 mg ai/kg body wt/day) and administered orally to the cats which were housed individually in galvanized wire cages. Flea infestations were established and maintained by infesting the test animals with adult fleas prior to and at weekly intervals after beginning treatment. Fifty, 7 to 14 day old, unfed adult fleas were placed along the

dorsal midline of each cat. Three cats were used per treatment, each cat receiving the feed supplements for one month.

Treatment effects on adult fleas were assessed by combing them from the cats each week. To determine possible reproductive effects on the subsequent generation, eggs from these adults were collected on plywood boards suspended beneath the cage of each cat. Flea eggs were swept from the boards with a soft nylon brush, transferred to larval rearing media and held for development through one generation.

**Single dose of 10 mg ai/kg body wt. of Compound 2 administered on day zero.

Although adult fleas feeding on the treated animals were not directly affected, the results from Tables 16 and 17 show that development of their offspring was significantly inhibited. This effect was particularly dramatic after 2 days of receiving the feed supplement, i.e., no F₁ progeny developed through to the adult stage. Examination of the larval rearing containers indicated that the lethal effect on the progeny of exposed adults occurred very early in development; probably within the egg or shortly after hatch. The results from Table 17 indicate that a single 10 mg/kg body weight dose administered orally to cats also provides excellent control (>98% nonviable eggs) for 3 days. Roughly 90% nonviable eggs were still being produced 5 days after treatment.

EXAMPLE XIX

Systemic Control of Black Blowfly in Mice

Male Swiss-Webster mice weighing 30 grams or more were administered the compounds identified in Table 18 via gavage. Four mice were used for each treatment and the controls. The compounds were formulated by mixing technical grade samples of each compound identified in Table 18 with Tween 20® to a 4% concentration. The mice were dosed at a concentration of 400 mg active ingredient/kg body weight. The mice used in the positive control (bromophos) were dosed at a concentration of 100 mg active ingredient/kg body weight. The mice were euthanized 16 hours following treatment and the rear legs excised. Twenty first instar black blowfly larvae [*Phormia regina* (Meigen)] were introduced to the excised mouse leg muscle tissue. Blowfly development was monitored (i) 48 hours after introduc-

tion to muscle tissue (as a measure of direct larval mortality), (ii) 5 days after introduction to muscle tissue (as a measure of inhibition of pupal development), and (iii) through to adult emergence of the control group (approximately 10-12 days after pupation). Percent mortality was determined by observation of the number of surviving larvae, pupae or adults in treated mice in comparison with the untreated controls.

Systemic Control of Endoparasitic Cestodes in Mice

Male Swiss-Webster mice weighing 30 grams or more which had been orally infected with tapeworm (*Hymenolepis nana*) eggs were treated with the compounds identified in Table 19. Four mice were used for each treated host and control and two mice were used for each nontreated host. Yomesan was used as a positive control. The compounds were administered as feed additive rations for 18 consecutive days at a concentration of 1000 ppm. Feed additive rations were prepared by uniformly blending technical grade samples of each compound identified in Table 19 with pulverized mice chow (Purina brand Rat Chow #5001). Mice were necropsied after 18 days on the ration and tapeworm development was monitored. Tapeworm eggs found in the gut of the treated mice were introduced into a second group of noninfected and nontreated mice (2 mice per treatment). These mice were each necropsied 14 days after infestation, and again tapeworm development was monitored. Percent mortality was determined by observation of tapeworm development in the gut of mice in comparison with the untreated control, and is based on the number of infected mice in comparison with the number of uninfected mice. The results in Table 19 demonstrate a reduction in tapeworm offspring in the nontreated host. The results in Table 19 also demonstrate direct adult tapeworm developmental inhibition by compounds 56 and 64.

Systemic Control of Cat Flea F₁ Progeny

Adult cats weighing 4.5–6.0 kg were treated with feed additive rations of the compounds identified in Table 20 for seven consecutive days. One cat was used for each treatment and the control. Feed additive rations were prepared by uniformly blending technical grade samples of each compound identified in Table 20 with the daily food to attain a 10 mg active ingredient/kg body weight dosage. Twenty-four hours after the cat hosts were given the feed additive ration for day number 1, each cat was infested with 100 adult cat fleas [*Ctenocephalides felis* (Bouche')] as 50:50 mixture of males and females. Cat flea ova were collected from pans suspended beneath each cage at various intervals (day numbers 4, 5 and 6), while the host cat was on the 7 day ration. Collected ova were cultured to determine hatch and development to adult stadium. The results are given in Table 20. Percent mortality was determined by observation of the collected ova which developed in comparison with the untreated control.

Systemic Control of Endoparasitic Nematodes in Mice

Male Swiss-Webster mice weighing 30 grams or more which had been orally infected with threadworm (*Nematospiroides dubius*) third stage larvae were treated with compounds identified in Table 21. Four mice were used for each treated host and the controls. Thiabendazole was used as a positive control. The compounds were administered as feed additive rations for 18 consecutive days at a concentration of 1000 ppm. Feed additive rations were prepared by uniformly blending technical grade samples of each compound identified in Table 21 with pulverized mice chow (Purina brand Rat Chow #5001). Mice were necropsied after 18 days on the ration and threadworm development was monitored. On days 12, 13 and 14 of the 18 day period, fecal pellets were collected from the mice and any threadworm eggs which had passed into the feces were cultured to third stage larvae (F₁). Culturing occurred in a clean petri dish at ambient temperature. Development from egg to third stage larvae occurred in about 7–10

days. The results in Table 21 are based on four mice per treatment for the treated host and the controls. Percent mortality for the treated host was determined by observation of threadworm in the necropsied mice after 18 days. Percent mortality for F₁ larvae was determined by observation of third stage larvae in the fecal material in comparison with the untreated control for days 12, 13 and 14 of the 18 day period. The results in Table 21 demonstrate a reduction in F₁ threadworm larvae in comparison with the untreated control for certain of the compounds. The results in Table 21 also demonstrate stunted threadworm size development in the treated host after 18 days.

It will be understood that the parasite species employed in the above tests are merely representative of a wide variety of endoparasites and ectoparasites that can be controlled by the acyl urea compounds represented by the generic formula 1.

Although the invention has been illustrated by the preceding examples, it is not to be construed as being limited thereby; but rather, the invention encompasses the generic area as hereinbefore disclosed. Various modifications and embodiments can be made without departing from the spirit and scope thereof.

We claim:

1. A method of systemically controlling parasites of warm-blooded host animals which comprises orally or percutaneously administering to the animal a parasitically effective amount of a compound having the formula:

wherein R is chloro, alkoxy or dialkylamino of from 1 to 6 carbon atoms, X is chloro or fluoro, X¹ is hydrogen, chloro or fluoro, Y is hydrogen, chloro, bromo, methyl or methoxy, Y¹ and Y² independently are hydrogen, chloro, bromo or methyl with the proviso that if Y¹ and

Y² are hydrogen and if R is chloro, then Y cannot be hydrogen or chloro, wherein the parasites are selected from mesostigmatids, itch mites, mange mites, scabies, chiggers, soft-bodied ticks, hard-bodied ticks, sucking lice, biting lice, dog fleas, cat fleas, oriental rat fleas, beg bugs, kissing bugs, horn flies, horse flies, stable flies, black flies, deer flies, louse flies, tsetse flies, punkies, mosquitoes, bot flies, blow flies, screwworms, cattle grubs, fleeceworms, threadworms, lungworms, hookworms, whipworms, nodular worms, stomach worms, round worms, pinworms, heartworms, tapeworms, liver flukes, and blood flukes.

2. The method of claim 1, in which the compound is 1-[4-(4-chloro-1-naphthoxy)-3,5-dichlorophenyl]-3-(2,6-difluorobenzoyl) urea.

3. The method of claim 1, in which the compound is 1-[4-(4-chloro-1-naphthoxy)-3-methylphenyl]-3-(2,6-difluorobenzoyl) urea.

4. The method of claim 1, in which the compound is 1-[4-(4-chloro-1-naphthoxy)-2,5-dimethyl-3-chlorophenyl]-3-(2,6-difluorobenzoyl) urea.

5. The method of claim 1, in which the compound is 1-[3-chloro-4-(4-chloro-1-naphthoxy)-2,5-dimethylphenyl]-3-(2-chlorobenzoyl) urea.

6. The method of claim 1, in which the compound is 1-[4-(4-chloro-1-naphthoxy)-2,3,5-trichlorophenyl]-3-(2,6-difluorobenzoyl) urea.

7. The method of claim 1, in which the compound is 1-[4-(4-chloro-1-naphthoxy)-3,5-dimethylphenyl]-3-(2,6-difluorobenzoyl) urea.

8. The method of claim 1, wherein the compound has the formula:

wherein X is chloro or fluoro and X¹ is hydrogen, chloro or fluoro.

9. The method of claim 1, in which from about 0.01 mg/kg body wt. to about 1000 mg/kg body wt. of the compound is administered to the host animal.

10. The method of claim 9, in which from about 1 mg/kg body wt. to about 100 mg/kg body wt. of the compound is administered to the host animal.

11. The method of claim 9, in which the administration is oral.

12. The method of claim 11, in which the administration is as a feed additive.

13. The method of claim 9, in which the administration is percutaneous.

14. The method of claim 13, in which the administration is by injection.

15. The method of claim 13, in which the administration is by pour-on application.

16. The method of claim 13, in which the administration is by implant.

17. The method of claim 13, in which the administration is by spraying.

18. The method of claim 13, in which the administration is by dipping or drenching.

19. The method of claim 1, in which the compound is used in combination with one or more biologically active materials.

20. The method of claim 1, in which the compound is used in combination with one or more medicinal drugs.

21. The method of claim 1, in which the compound is used in combination with one or more vertebrate toxicants.

22. The method of claim 1, in which the compound is used in combination with one or more growth promoters.

23. The method of claim 1, in which the compound is used in combination with one or more vitamins.

24. The method of claim 1, in which the compound is used in combination with one or more minerals.

25. The method of claim 1, wherein the warm-blooded animals are selected from cattle, horses, sheep, goats, poultry, swine, dogs and cats.

26. The method of claim 25, wherein the compound is injected into the animal in a formulation comprising vegetable waxes or semi-solid high molecular weight polyethylene glycols or is injected into the animal as a suspension of a surfactant, suspending agent and a liquid carrier selected from vegetable oil, glycol or water.

27. The method of claim 25, wherein the parasite is poultry lice and the compound is compound 2 of present Table 1.

28. The method of claim 25, wherein the parasite is cattle lice, the animal is cattle and the compound is selected from compounds 1 and 2 of present Table 1.

29. The method of claim 25, wherein the parasite is sarcoptic mange, and the compound is compound 2 of present Table 1.

30. The method of claim 29, wherein the animal is swine.

31. The method of claim 25, wherein the parasite is a flea and the compound is compound 2 of present Table 1.

32. The method of claim 31, wherein the animal is a cat and the method prevents emergence of flea larvae from flea eggs.

33. The method of claim 25, wherein the parasite is an endoparasitic cestode and the compound is compound 5 of present Table 1.

34. The method of claim 25, wherein the parasite is a flea and the compound is selected from compounds 2, 5 and 14 of present Table 1.

35. The method of claim 33, wherein the animal is a cat and the method prevents emergence of flea larvae from flea eggs.

36. A method for systemically controlling parasites of warm-blooded host animals which comprises orally or percutaneously administering to the animal a pesticidally effective amount of a compound, wherein the parasite is an endoparasitic nematode and the compound is selected from compounds 2, 4, 5, 21 and 37 of present Table 1.

37. A method of systemically controlling parasites of warm-blooded host animals which comprises orally or percutaneously administering to the animal a parasitically effective amount of a compound having the formula:

wherein R is chloro, or dialkylamino of from 1 to 6 carbon atoms, X is hydrogen, chloro or fluoro, X¹ is chloro or fluoro, Y is hydrogen, chloro, bromo, methyl or methoxy, Y¹ and Y² independently are hydrogen, chloro, bromo or methyl, wherein the parasites are selected from mesostigmatids, itch mites, mange mites, scabies, chiggers, soft-bodied ticks, hard-bodied ticks, sucking lice, biting lice, dog fleas, cat fleas, oriental rat fleas, beg bugs, kissing bugs, horn flies, horse flies, stable flies, black flies, deer flies, louse flies, tsetse flies, punkies, mosquitoes, bot flies, blow flies, screwworms, cattle grubs, fleeceworms, threadworms, lungworms, hookworms, whipworms, nodular worms, stomach worms, round worms, pinworms, heartworms, tapeworms, liver flukes, and blood flukes.

38. The method of claim 37, in which the compound is 1-[4-(4-chloro-5,6,7,8-tetrahydro-1-naphthoxy)-2-methyl-5-chlorophenyl]-3-(2,6-difluorobenzoyl) urea.

39. The method of claim 37, in which the compound is 1-[4-(4-dimethylamino-5,6,7,8-tetrahydro-1-naphthoxy)-2,5-dimethyl-3-chlorophenyl]-3-(2,6-difluorobenzoyl) urea.

40. The method of claim 37, in which the compound is 1-[3-chloro-4-(4-chloro-5,6,7,8-tetrahydro-1-naphthoxy)-2,5-dimethylphenyl]-3-(2,6-difluorobenzoyl) urea.

41. The method of claim 37, wherein the compound has the formula:

wherein X¹ is chloro or fluoro, X is hydrogen, chloro or fluoro, and R is chloro or dimethylamino.

42. The method of claim 37, in which from about 0.01 mg/kg body wt. to about 1000 mg/kg body wt. of the compound is administered to the host animal.

43. The method of claim 37, in which from about 1 mg/kg body wt. to about 100 mg/kg body wt. of the compound is administered to the host animal.

44. The method of claim 37, in which the administration is oral.

45. The method of claim 44, in which the administration is as a feed additive.

46. The method of claim 42, in which the administration is percutaneous.

47. The method of claim 46, in which the administration is by injection.

48. The method of claim 46, in which the administration is by pour-on application.

49. The method of claim 46, in which the administration is by implant.

50. The method of claim 46, in which the administration is by spraying.

51. The method of claim 46, in which the administration is by dipping or drenching.

52. The method of claim 37, in which the compound is used in combination with one or more biologically active materials.

53. The method of claim 37, in which the compound is used in combination with one or more medicinal drugs.

54. The method of claim 37, in which the compound is used in combination with one or more vertebrate toxicants.

55. The method of claim 37, in which the compound is used in combination with one or more growth promoters.

56. The method of claim 37, in which the compound is used in combination with one or more vitamins.

57. The method of claim 37, in which the compound is used in combination with one or more minerals.

58. The method of claim 37, wherein the warm-blooded animals are selected from cattle, horses, sheep, goats, poultry, swine, dogs and cats.

59. The method of claim 58, wherein the compound is injected into the animal in a formulation comprising vegetable waxes or semi-solid high molecular weight polyethylene glycols or is injected into the animal as a suspension of a surfactant, suspending agent and a liquid carrier selected from vegetable oil, glycol or water.

60. A method of systemically controlling parasites of warm-blooded host animals which comprises orally or percutaneously administering to the animal a parasitically effective amount of a compound having the formula:

wherein R is chloro, alkoxy or dialkylamino of from 1 to 6 carbon atoms, X is chloro or fluoro, X¹ is hydrogen, chloro or fluoro, Y is hydrogen, chloro, bromo, methyl or methoxy, Y¹ and Y² independently are hydrogen, chloro, bromo or methyl with the proviso that if Y¹ and Y² are hydrogen and if R is chloro, then Y cannot be hydrogen or chloro, wherein the parasites are selected from mites, ticks, lice, fleas, true bugs, bloodsucking adult flies, parasitic fly maggots, nematodes, cestodes, trematodes, thorny-headed worms and tongueworms.

61. A method of systemically controlling parasites of warm-blooded host animals which comprises orally or percutaneously administering to the animal a parasitically effective amount of a compound having the formula:

wherein R is chloro, or dialkylamino of from 1 to 6 carbon atoms, X is hydrogen, chloro or fluoro, X¹ is chloro or fluoro, Y is hydrogen, chloro, bromo, methyl or methoxy, Y¹ and Y² independently are hydrogen, chloro, bromo or methyl, wherein the parasites are selected from mites, ticks, lice, fleas, true bugs, blood-sucking adult flies, parasitic fly maggots, nematodes, cestodes, trematodes, thorny-headed worms and tongueworms.

62. A method of systemically controlling parasites of warm-blooded host animals which comprises orally or percutaneously administering to the animal a parasitically effective amount of a compound, wherein the animal is a white leghorn laying hen, the parasite is a northern fowl mite and the compound is selected from compounds 1, 2, 3, 4, 5, 6, 7, 20, 21 and 29 of present Table 1.

63. A method for systemically controlling parasites of warm-blooded host animals which comprises orally or percutaneously administering to the animal a pesticidally effective amount of a compound, wherein the parasite is a bot fly and the compound is selected from compounds 4, 5, 6, 14, 18, 21 and 29 of present Table 1.

64. A method for systemically controlling parasites of warm-blooded host animals which comprises orally or percutaneously administering to the animal a pesticidally effective amount of a compound, wherein the parasite is a blowfly and the compound is selected from compounds 2, 4, 5, 6, 7, 14, 21, 23, 33, 34, 39, 43, 48, 68 and 85 of present Table 1.
