# SUBSTITUTED PYRRIDOPYRIMIDINES USEFUL AS ANGIOTENSIN II ANTAGONISTS

## BACKGROUND OF THE INVENTION

This invention relates to substituted pyrimidines which are useful for the treatment of hypertension. They achieve this by antagonizing the effects of angiotensin II; the active component of the renin angiotensin system.

Angiotensinogen is converted to angiotensin I by the action of the enzyme renin. Angiotensin II (A II) is formed by angiotensin converting enzyme (ACE) acting on angiotensin I. A II is a powerful vasoconstrictor and is implicated as the cause of high blood pressure in a number of species including man. A II elicits these vasopressor responses by acting as specific receptor sites. The compounds described in this invention compete with A II for these receptor sites, thus antagonizing the vasopressor effects of A II.

## PRIOR ART

E. E. Allen et al. disclose N-substituted oxypyrimidines in EP 0419048 A.

E. E. Allen et al. describe 4-oxo-quinazolines in EP 0411766 A.

D. A. Roberts et al. describe quinoline ethers in EP 0412848 A.

D. J. Carini et al. describe N-substituted benzimidazoles in U.S. Pat. No. 4,880,804. P. Chakravarty et al. disclose similar imidazole structures in EP 0401030 A where the phenyl aromatic ring is replaced by a seven membered heterocycle. Azabenzimidazoles are described by P. Herold et al. in EP 0415886 A.

D. J. Carini et al. disclose N-substituted imidazoles in EP 0253310, EP 0324377, and U.S. Pat. No. 4,916,129.

D. J. Carini et al. disclose in EP 0323841 N-substituted pyrazoles, pyrroles and triazoles. Similar pyrazole derivatives are disclosed by T. Naka et al. in EP 0411507 A and additional triazoles are described by L. L. Chang et al. in EP 0412594 A.

All of the above are claimed as A II antagonists.

The compounds of this invention differ from the above mentioned prior art in that they contain a pyrimidine ring fused to a pyrrolone, pyridinone, azepinone, or azocinone ring. Except for the first reference (E. E. Allen et al. EP 0419048 A), the non-peptidic A II antagonists disclosed in the above mentioned prior art are all nitrogenous 5-membered rings, either isolated or fused to phenyl rings, or nitrogenous 6-membered rings fused to phenyl rings. The compounds in EP 0419048 A are pyrimidin-4-ones.

R. F. Shuman et al. disclose in U.S. Pat. No. 5,039,814 a process for the synthesis of 2-substituted 1-(tetrazol-5-yl)benzenes which comprises the directed ortholithiation of 1-(tetrazol-5-yl)benzenes and subsequent reaction of the lithiated intermediate with an electrophile. The triphenylmethyl group is used as a protecting group on the tetrazole.

The process of the present invention differs in that a 2-bromo-1-(tetrazol-5-yl)aryl protected with a tert-butyl group is converted to a 2-(tetrazol-5-yl)arylboronic acid directly by the addition of Mg and a trialkylborate concurrently.

### PROCESS

The compounds of the present invention are prepared according to the general sequence of reactions outlined in the Schemes below:

#### Scheme I

Scheme I

wherein  $\text{R}^1$ ,  $\text{R}^2$ ,  $\text{R}^3$ ,  $\text{R}^4$ ,  $\text{R}^5$ ,  $n$ ,  $m$ ,  $p$ ,  $\text{Ar}^1$ , and  $\text{Ar}^2$  are as defined above.

Thus a  $\beta$ -keto ester **1** (Scheme I) is condensed with an amidine **2** in the presence of a base such as sodium ethoxide in an alcoholic solvent such as ethanol at temperatures ranging from ambient to reflux to yield a pyrimidone **3**. Treatment of a pyrimidone **3** with phosphorus oxychloride under reflux gives a chloropyrimidine **4**. The reaction of **4** with the amine **5** in the presence of an organic base such as triethylamine or an inorganic base such as potassium carbonate in a polar solvent such as ethanol, butanol, or dimethylsulfoxide at temperatures ranging from ambient to reflux yields the target pyrimidines **I**. The amine **5** is prepared by the palladium catalyzed cross-coupling of an arylstannane or an arylboronic acid with an aryl bromide or an aryl iodide, and subsequent functionalization to an amine.

An alternative process for the production of the compounds of the present invention is set forth in Scheme II.

Scheme II

wherein  $\text{R}^1$ ,  $\text{R}^2$ ,  $\text{R}^3$ ,  $\text{R}^4$ ,  $\text{R}^5$ ,  $n$ ,  $m$ ,  $p$ ,  $\text{Ar}^1$ , and  $\text{Ar}^2$  are as defined above, and  $\text{Y}$  is a para-bromo or para-iodo group.

Thus the chloropyrimidine **4** (Scheme II) is treated with an amine **7** in the presence of an inorganic base such as sodium bicarbonate in an alcoholic solvent such as ethanol or *n*-butanol at temperatures ranging from  $80^\circ\text{C}$ . to  $150^\circ\text{C}$ . to give the bicyclic compound **8**. The reaction of **8** with the arylboronic acid **9** in the presence of a palladium catalyst in a solvent such as DMF or toluene yields the target pyrimidines **I**. In the case where the substituent on  $\text{Ar}^2$  is a nitrile, it can be converted to a tetrazole under standard conditions utilizing an azide reagent.

The arylboronic acid **9** is prepared as shown in Scheme III.

Scheme III

wherein  $\text{Ar}^2$  is as defined above and  $\text{R}^7$  is lower alkyl.

Thus the aryl bromide **10** is treated with Mg and a trialkyl borate in an aprotic solvent such as THF. Acidic hydrolysis gives the boronic acid **9**.

An alternative process for the production of the compounds of the present invention is set forth in Scheme II.

Scheme II

65

Scheme IV

wherein R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup>, n, m, Ar<sup>1</sup>, and Ar<sup>2</sup> are as defined above, and Z is a halogen.

Thus the chloropyrimidine 4 is converted to the bicyclic compound 11 by treatment with ammonia in an alcoholic solvent such as ethanol at temperatures ranging from 100° C. to 150° C. Alkylation of 11 by the biaryl compound 12 is achieved in the presence of a base such as NaH in a solvent such as DMF or THF to give the pyrimidines I. In the case where the substituent on Ar<sup>2</sup> is a nitrile, it can be converted to a tetrazole by standard conditions utilizing an azide reagent. The biaryl compound 12 is prepared by the palladium catalyzed cross-coupling of an arylstannane or an arylboronic acid with an aryl bromide or an aryl iodide.

When X above is tetrazole, the preferred protecting groups for said tetrazole are those where R<sup>6</sup> is tert-butyl, tri-n-butylstannyl, or triphenylmethyl. The above groups may be optimally removed by acidic or basic hydrolysis, or catalytic hydrogenation as described by T. Greene, *Protective Groups in Organic Synthesis*, Wiley-Interscience (1980).

The high affinity of the compounds for the angiotensin II receptor was established using a rat adrenal receptor binding assay, measuring the displacement of radiolabeled angiotensin II from the receptor, described as follows: Membrane preparation: 1. Anesthetize male Sprague-Dawley rats, 300-400 g body weight, with CO<sub>2</sub> and sacrifice by cervical dislocation. 2. Dissect adrenal glands and keep in ice-cold sucrose buffer (0.2M sucrose, 1 mM EDTA, 10 mM Trizma base, pH=7.2). 3. Remove medulla by squashing. Mince the cortex, rinse and homogenize in a chilled ground glass tissue grinder with 15 mL sucrose buffer. 4. Centrifuge at 3000×g for 10 min. (Sorvall RCSC centrifuge, SS34 rotor 6200 rpm). Decant supernatant through gauze. 5. Centrifuge combined supernatants at 12000×g for 13 min. (Beckman ultracentrifuge, 80Ti rotor, 13000 rpm). 6. Centrifuge the supernatant from step 5 at 102000×g for 60 min. (Beckman ultracentrifuge, 80Ti rotor, 38200 rpm). All steps are carried out at 4° C. 7. Resuspend the pellet in 0.5 mL assay buffer (50 mM Tris HCl, 5 mM MgCl<sub>2</sub>, 0.2% BSA (protease-free), pH=7.4, 25° C.). 8. Store on ice. 9. Determine membrane protein by Lowry or Bradford assay with BSA as standard. Binding assay: (The assay is performed in triplicate, in 12×75 mm plastic test tubes or in a 96-well plate (final volume of 0.25 mL). 1. Add 140  $\mu$ L assay buffer. 2. Add 10  $\mu$ L cold A II (to give final concentrations of 10<sup>-10</sup>-10<sup>-7</sup>M for standard curve and 10<sup>-4</sup>M for non-specific binding), compounds (e.g., for final concentrations of 25 and 100  $\mu$ M or 1  $\mu$ M, 10 nM and 100 nM) in 50% DMSO, or 50% DMSO as a control. 3. Add 50  $\mu$ L membrane suspension (e.g., 10  $\mu$ g protein). 4. Preincu-

bate for 30 min at 25° C. 5. Add 50  $\mu$ L  $^{125}$ I-A II which has been prepared as shown below (final concentration = 1 nM). 6. Incubate for 35 min at 25° C. 7. Stop the incubation by adding 1 mL ice-cold buffer (assay buffer without BSA). Filter with GF/C filters on cell harvester (filters are presoaked in the assay buffer containing 1% polyethyleneimine). 9. Rinse assay tubes 3X with 5 mL cold buffer (assay buffer without BSA). 10. Cut and deposit the filter discs into test tubes and count on gamma counter for 1 min. Preparation of  $^{125}$ I-A II: Adjust the specific activity of  $^{125}$ I-A II purchased from New England Nuclear to 500  $\mu$ Ci/nmole by adding cold A II in water. 1. Calculate the quantities of hot A II and the cold A II needed and make the dilution. Aliquot, seal tight, and store frozen until needed. 2. Calculate the concentration of the total A II (hot + cold) after dilution. 3. On the day of assay, thaw the frozen aliquot and adjust the volume to give a concentration of 5 pmole/mL (or 0.25 pmole/50  $\mu$ L) with assay buffer (+protease-free BSA). For final concentration of 1 nM  $^{125}$ I-A II in the assay, add 50  $\mu$ L (or 0.25 pmole) per test tube to a final volume of 250  $\mu$ L. The results of these binding assays are reported as the inhibitory concentration of the test compound necessary to achieve fifty percent displacement of radiolabeled A II from its receptor ( $IC_{50}$ ), or the percent displacement of binding of A II at its receptor at  $10^{-8}$ M concentration of test compound (% I). All the examples cited in this invention displayed significant inhibition of A II binding in this assay. Typically these compounds displayed an  $IC_{50}$  in this assay of less than or equal to 50  $\mu$ M.

In accordance with their ability to antagonize angiotensin II, the compounds of this invention show antihypertensive action in the following A II-infused rat model. Procedure: Rats are anesthetized with Dial-Urethane (0.60 mL/kg, ip) and the trachea cannulated with PE 240. Either one femoral artery and both femoral veins or the carotid artery and the corresponding jugular vein are cannulated with PE 50. If the jugular vein is cannulated, two cannulas are placed in the one vein. The initial portion of the duodenum (just distal to the stomach) is cannulated with PE 50 via a small midline incision. Arterial pressure and heart rate are measured from the arterial cannula. Ten to 15 min are allowed following surgery for stabilization of arterial pressure. Ganglion blockade is then produced by intravenous administration of mecamylamine at 3 mg/kg (1 mL/kg of a 3 mg/mL solution). Ganglion blockade causes a fall in arterial pressure of about 50 mmHg. Mecamylamine is given every 90 min throughout the remainder of the experiment. An A II infusion is then begun into the other venous cannula at 0.25  $\mu$ g/kg min (at 9.6  $\mu$ L/min). The A II infusion returns arterial pressure to or slightly above the control level. Once arterial pressure has stabilized with the A II infusion, baseline values for mean arterial pressure (MAP) and heart rate are taken. The test compound, suspended in methyl cellulose, is then administered via the duodenal cannula at 0.1, 3 or, 30 mg/kg in a volume of 1 mL/kg. Mean arterial pressure and heart rate values are tabulated at 15, 30, 60, 90, 120, 150, 180, 210, and 240 min after administration of the test compound. For example, the product of Example 1 administered at 3mg/kg id lowered the A II dependent blood pressure by an average of 41% four hours post-administration.

As illustrated above the compounds of this invention are effective A II antagonists and therefore are useful for treating hypertension. They are also of value in the

management of acute and chronic congestive heart failure, primary and secondary pulmonary hyperaldosteronism, secondary hyperaldosteronism, primary and secondary pulmonary hypertension, hypertension associated with oral contraceptive use, vascular disorders such as migraine, Raynaud's disease, luminal hyperplasia and the atherosclerotic process, renal diseases or renal complications of other diseases or therapies such as proteinuria, glomerulonephritis, glomerular sclerosis, scleroderma, diabetic nephropathy, end stage renal disease, renal transplant therapy and others. These compounds will also be useful in the treatment of left ventricular dysfunction, diabetic retinopathy, Alzheimers disease, in the enhancement of cognition, in treatment of elevated intraocular pressure, and in the enhancement of retinal blood flow. The application of the compounds of this invention for these and similar disorders will be apparent to those skilled in the art.

Specific procedures are described in the following experimental examples. These examples are given to illustrate the invention and should not be construed as limiting the invention set forth in the appended claims.
