Cyclosporins wherein the residue at the 1-position (typically -MeBmt- or -dihydro-MeBmt-) is 3'-O-acylated or 3'-oxo or -C₁₋₄alkoxyimino substituted, or wherein the residue at the 2-position is β -O-acyl or β -oxo substituted, or wherein the residue at the 2-position is -Ile-, or wherein the residue at the 11-position is -MeAls-, -MeIle- or -Meallole- as well as various naturally occurring cyclosporins/dihydro-derivatives thereof, are useful in reversing resistance to chemotherapy, in particular resistance to cytostatic or anti-neoplastic therapy. Various of these cyclosporins and intermediates for their production are novel. Intermediates wherein the residue (e.g. -MeBmt-, -dihydro-MeBmt- etc.) at the 1-position is 8'-alkoxy or 7'-desmethyl-7'-hydrocarbyl substituted are novel and useful as immunosuppressants, anti-inflammatory and anti-parasitic agents.

5 Claims, No Drawings

CYCLOSPORINS AND THEIR USE AS PHARMACEUTICALS

This is a continuation of application Ser. No. 08/067/274, filed May 24, 1993 and now abandoned, which is a continuation of application Ser. No. 07/874,676, filed Apr. 27, 1992, which in turn is a continuation of application Ser. No. 07/704,758, filed May 23, 1991 which in turn is a continuation of application Ser. No. 07/208,422, filed Jun. 17, 1988, the latter three of which are now abandoned.

The present invention relates to a new use, in particular a new pharmaceutical use, for cyclosporins, as well as to new cyclosporins as novel compounds per se.

The cyclosporins comprise a class of structurally distinctive, cyclic, poly-N-methylated undecapeptides, generally possessing pharmacological, in particular immunosuppressive, anti-inflammatory and/or anti-parasitic activity, each to a greater or lesser degree. The first of the cyclosporins to be isolated was the naturally occurring fungal metabolite Cyclosporin or Cyclosporine, also known as cyclosporin A and now commercially available under the registered trademark SANDIMMUN®. Cyclosporin is the cyclosporin of formula A

wherein -McBmt- represents the N-methyl-(4R)-4-but-2E-en-1-yl-4-methyl-(L)threonyl residue of formula B

in which —x—y— is trans —CH=CH— and the position 2', 3' and 4' have the configuration S, R and R respectively.

Since the original discovery of Cyclosporin, a wide variety of naturally occurring cyclosporins have been isolated and identified and many further non-natural cyclosporins have been prepared by total- or semi-synthetic means or by the application of modified culture techniques. The class comprised by the cyclosporins is thus now substantial and includes, for example, the naturally occurring cyclosporins A through Z [c.f. Traber et al. 1, *Helv. Chim. Acta*, 60, 1247-1255 (1977); Traber et al. 2, *Helv. Chim. Acta*, 65, 1655-1667 (1982); Kobel et al., *Europ. J. Applied Microbiology and Biotechnology* 14, 237-240 (1982); and von Wartburg et al., *Progress in Allergy*, 38, 28-45 (1986)], as well as various non-natural cyclosporin derivatives and artificial or synthetic cyclosporins including the dihydro- and iso-cyclosporins [in which the moiety —x—y— of the -McBmt- residue (Formula B above) is saturated to give —x—y—=—CH₂—CH₂—/the linkage of the residue -McBmt- to the residue at the 11-position of the cyclosporin molecule (Formula A above) is via the 3'-O-atom rather than the α-N-atom]; derivatised cyclosporins (e.g. in which the 3'-O-atom of the -McBmt- residue is acylated or a further substituent is introduced at the α-carbon atom of the sarcosyl residue at the 3-position); cyclosporins in which the

-McBmt- residue is present in isomeric form (e.g. in which the configuration across positions 6' and 7' of the -McBmt- residue is cis rather than trans); and cyclosporins wherein variant amino acids are incorporated at specific positions within the peptide sequence employing e.g. the total synthetic method for the production of cyclosporins developed by R. Wenger—see e.g. Traber et al. 1, Traber et al. 2 and Kobel et al. loc. cit.; U.S. Pat. Nos. 4,108,985, 4,210,581, 4,220,641, 4,288,431, 4,554,351 and 4,396,542; European Patent Publications Nos. 0 034 567 and 0 056 782; International Patent Publication No. WO 86/02080; Wenger 1, *Transpl. Proc.* 15, Suppl. 1:2230 (1983); Wenger 2, *Angew. Chem. Int. Ed.*, 24, 77 (1985); and Wenger 3, *Progress in the Chemistry of Organic Natural Products* 50, 123 (1986).

The class comprised by the cyclosporins is thus now very large indeed and includes, for example, [Thr]²-, [Val]²-, [Nva]²- and [Nva]²-[Nva]⁵-Cyclosporin (also known as cyclosporins C, D, G and M respectively), [3-O-acetyl-McBmt]¹-Cyclosporin (also known as cyclosporin A acetate), [Dihydro-McBmt]¹-[Val]²-Cyclosporin (also known as dihydro-cyclosporin D), [Iso-McBmt]¹-[Nva]²-Cyclosporin (also known as isocyclosporin G), [(D)Ser]⁸-Cyclosporin, [Melle]¹¹-Cyclosporin, [(D)McVal]¹¹-

Cyclosporin (also known as cyclosporin H), [MeAla]⁶-Cyclosporin, [(D)Pro]³-Cyclosporin and so on.

[In accordance with conventional nomenclature for cyclosporins, these are defined throughout the present specification and claims by reference to the structure of Cyclosporin (i.e. Cyclosporin A). This is done by first indicating the amino acid residues present which differ from those present in Cyclosporin (e.g. "[D)Pro]³" to indicate that the cyclosporin in question has a -(D)Pro- rather than -Sar- residue at the 3-position) and then applying the term "Cyclosporin" to characterise remaining residues which are identical to those present in Cyclosporin.

The residue -McBmt- at position 1 in Cyclosporin was unknown before the discovery of the cyclosporins. This residue and variants or modifications of it, e.g. as described below, are thus generally characteristic of the cyclosporins. In general, variants or alternatives to [McBmt]¹ are defined by reference to the -McBmt- structure. Thus for dihydrocyclosporins in which the moiety —x—y— (see formula B above) is reduced to —CH₂—CH₂—, the residue at the 1-position is defined as "-dihydro-McBmt-". Where the configuration across the moiety —x—y— is cis rather than trans, the resulting residue is defined as "-cis-McBmt-".

Where portions of the -McBmt- residue are deleted, this is indicated by defining the position of the deletion, employing the qualifier "des" to indicate deletion, and then defining the group or atom omitted, prior to the determinant "-McBmt-", "-dihydro-McBmt-", "-cis-McBmt-" etc. Thus "-N-desmethyl-McBmt-", "-3'-desoxy-McBmt-" and "-3'-desoxy-4'-desmethyl-McBmt-" are the residues of Formula B¹, B², and B³ respectively:

5

wherein —x—y— is —CH₂—CH₂— or trans —CH=CH— and ACYL¹ represents an acyl group.

Suitable acyl groups as ACYL¹ in formula I, are those of formula R₁—CO— and R₂—O—CO— wherein R₁ is C₁₋₄alkyl or C₁₋₄azidoalkyl and R₂ is C₁₋₄alkyl, e.g. acetyl, 4-azidobutanoyl or methoxycarbonyl. Preferably ACYL¹ is a group of formula R₁—CO—, in which case R₁ is preferably C₁₋₄alkyl. Most preferably R₁—CO— is acetyl.

Alkyl groups as or comprising R₁ and R₂ may be branched or straight chain. Preferably they are straight chain. R₁ is most preferably methyl.

Especially preferred cyclosporins of group 1a¹ are those of the formula II or II'

wherein

A is a residue as defined under 1a¹ above

B is —αAbu—, —Thr—, —Val—, —Nva— or the residue of a β-O-acyl-α-amino acid,

X is —Sar— or the residue of an optically active, α-N-methylated α-amino acid residue having the (D)-configuration,

Y is —Val— or additionally, when B is —Nva—, —Nva—, and

W is the residue of a β-hydroxy- or β-O-acyl-α-amino acid having the (D)-configuration.

When B is a β-O-acyl-α-amino acid residue, this will generally have the (L) configuration. Suitably it is a residue of formula III

Wherein ACYL² represents an acyl group. Preferably it is an O-acyl-(L)-threonyl residue.

W is suitably —(D)Ser— or —(D)Thr— or O-acyl-(D)Ser— or O-acyl-(D)Thr— of formula III'

Wherein ACYL² has the meaning given for formula III and R is hydrogen or methyl.

Preferred acyl groups as ACYL² in formula III and III' are those of the formula R₃—CO— wherein R₃ is C₁₋₄alkyl.

6

Alkyl groups as R₃ may be branched or straight chain. Preferably they are straight chain. Suitably ACYL² is acetyl.

When X in formula II is other than —Sar—, it is suitably —(D)Ala—.

5 Examples of cyclosporins of this class suitable for use in accordance with the present invention are:

1.1 [3'-O-Acetyl-McBmt]¹-Ciclosporin;

1.2 [3'-O-Acetyl-McBmt]¹-[Val]²-Ciclosporin;

1.3 [3'-O-Acetyl-McBmt]¹-[Thr]²-Ciclosporin;

1.4 [3'-O-Acetyl-McBmt]¹-[Nva]²-Ciclosporin;

10 1.5 [3'-O-Acetyl-McBmt]¹-[Nva]²-[Nva]⁵-Ciclosporin;

1.6 [3'-O-Acetyl-McBmt]¹-[(D)Ala]³-Ciclosporin;

1.7 [3'-O-Acetyl-McBmt]¹-[Nva]²-[(D)Ala]³-Ciclosporin;

1.8 [3'-O-Acetyl-McBmt]¹-[(D)McVal]¹¹-Ciclosporin;

1.9 [3'-O-Acetyl-McBmt]¹-[Val]¹¹-Ciclosporin;

15 1.10 [3'-O-Acetyl-dihydro-McBmt]¹-Ciclosporin;

1.11 [3'-O-Methoxycarbonyl-McBmt]¹-Ciclosporin;

1.12 [3'-O-(4-Azidobutanoyl)-McBmt]¹-Ciclosporin;

1.13 [3'-O-Acetyl-McBmt]¹-[O-acetyl-Thr]²-Ciclosporin;

20 1.14 [3'-O-Acetyl-N-desmethyl-McBmt]¹-[O-acetyl-Thr]²-Ciclosporin; and

1.15 [3'-O-Acetyl-McBmt]¹-[O-acetyl-(D)Ser]⁸-Ciclosporin;

Preferred cyclosporins for use in accordance with the invention are cyclosporins 1.1 to 1.10 inclusive and 1.15 above and, most especially, cyclosporins 1.1, 1.2, 1.3, 1.4, 1.10 and 1.15.

A further group of cyclosporins of type 1a are those:

35 1a²) Wherein the residue at the 1-position is a 3'-O-acyl-8'-C₁₋₈-alkoxy- -cis-McBmt- or -dihydro-McBmt- residue of the formula IV

wherein

—x—y— is cis —CH=CH— or —CH₂—CH₂—, R₄ is C₂₋₉alkoxymethyl and ACYL¹ represents an acyl group.

55 Especially suitable as acyl groups in formula IV are those of formula R₅—CO— wherein R₅ is C₁₋₄alkyl.

Alkyl groups as R₅, as well as alkyl moieties comprising R₄, may be branched or straight chain. Preferably they are straight chain. Preferably R₄ is C₂₋₅alkoxymethyl. ACYL¹ in formula IV is suitably acetyl.

Especially preferred cyclosporins of group 1a² are those of formula II as illustrated above, wherein A is a residue of formula IV as defined above, B has the meanings given for formula II, X is —Sar— and Y is —Val—.

65 Examples of cyclosporins of group 1a², suitable for use in accordance with the present invention are:

1.16 [3'-O-acetyl-8'-methoxy-cis-McBmt]¹-Ciclosporin;

- 1.17 [3'-O-acetyl-8'-t.butoxy-cis-MeBmt]¹-Ciclosporin;
 1.18 [3'-O-acetyl-8'-methoxy-cis-MeBmt]¹-[O-acetyl-Thr]²-Ciclosporin;
 1.19 [3'-O-acetyl-8'-t.butoxy-cis-MeBmt]¹-[O-acetyl-Thr]²-Ciclosporin;
 1.20 [3'-O-acetyl-8'-methoxy-cis-MeBmt]¹-[Val]²-Ciclosporin; and
 1.21 [3'-O-acetyl-8'-methoxy-cis-MeBmt]¹-[Nva]²-Ciclosporin.

A further group of cyclosporins of type 1a are those:

- 1a³) Wherein the residue at the 1-position is a -3'-O-acyl-cis-MeBmt-; a -3'-O-acyl-7'-desmethyl-7'-hydrocarbyl-MeBmt- or -cis-MeBmt- residue, wherein the hydrocarbyl moiety comprises at least two carbon atoms; or a -3'-O-acyl-7'-desmethyl-7'-hydrocarbyl-dihydro-MeBmt- residue, wherein the hydrocarbyl moiety comprises at least two carbon atoms and wherein any aliphatic group or moiety present in said hydrocarbyl moiety is saturated.

These residues may be represented by the formula V

wherein

—x—y— is cis or trans —CH=CH— or —CH₂—CH₂—

R₆ is hydrocarbyl and ACYL¹ represents an acyl group, with the proviso that, when —x—y— is trans —CH=CH— or —CH₂—CH₂—, R₆ comprises at least two carbon atoms (i.e. is other than methyl), and when —x—y— is —CH₂—CH₂— any aliphatic group or moiety present as or in R₆ is saturated.

Especially suitable as acyl groups in formula V are those of formula R₅—CO— wherein R₅ is C₁₋₄alkyl, in particular acetyl.

Hydrocarbyl groups as R₆ include aromatic, aliphatic and araliphatic groups, whereby aliphatic groups and moieties may be branched or straight chain. Such groups may also bear further substituents such as halogen or hydroxy or may be unsubstituted.

Suitable hydrocarbyl groups as R₆ are alkyl, alkenyl, alkynyl, phenyl, phenylalkyl, phenylalkenyl and phenylalkynyl, especially alkyl, alkenyl and alkynyl groups containing maximally 20, preferably maximally 8 carbon atoms, and phenyl, phenylalkyl and phenylalkynyl groups containing maximally 12 carbon atoms.

Especially preferred groups R₆ are phenyl, phenyl-(C₁₋₄alkyl), C₁₋₁₀-alkyl, C₂₋₁₀alkenyl and C₂₋₁₀alkynyl, especially phenyl, and C₁₋₅-alkyl.

When —x—y— in formula V is —CH₂—CH₂—, hydrocarbyl groups as R₆ will include aromatic, saturated aliphatic and araliphatic groups in which the aliphatic moiety is saturated, e.g. including any such groups of this type as set forth above.

Especially preferred cyclosporins of this group are those of formula II as illustrated above, wherein A is a residue of formula V as defined above, B has the meanings given for formula II, X is -Sar- and Y is -Val-.

Examples of cyclosporins of this group, suitable for use in accordance with the present invention are:

- 1.22 [3'-O-acetyl-7'-desmethyl-7'-phenyl-MeBmt]¹-Ciclosporin;
 1.23 [3'-O-acetyl-cis-MeBmt]¹-Ciclosporin;
 1.24 [3'-O-acetyl-7'-desmethyl-7'-vinyl-cis-MeBmt]¹-Ciclosporin;
 1.25 [3'-O-acetyl-7'-desmethyl-7'-vinyl-cis-MeBmt]¹-[O-acetyl-Thr]²-Ciclosporin;
 1.26 [3'-O-acetyl-7'-desmethyl-7'-i.pentyl-cis-MeBmt]¹-Ciclosporin;
 1.27 [3'-O-acetyl-7'-desmethyl-7'-phenyl-cis-MeBmt]¹-Ciclosporin;
 1.28 [3'-O-acetyl-7'-desmethyl-7'-n.propyl-cis-MeBmt]¹-Ciclosporin;
 1.29 [3'-O-acetyl-7'-desmethyl-7'-(β-allyl)-cis-MeBmt]¹-Ciclosporin;
 1.30 [3'-O-acetyl-7'-desmethyl-7'-phenyl-MeBmt]¹-[Val]²-Ciclosporin;
 1.31 [3'-O-acetyl-7'-desmethyl-7'-phenyl-cis-MeBmt]¹-[Val]²-Ciclosporin;
 1.32 [3'-O-acetyl-7'-desmethyl-7'-vinyl-cis-MeBmt]¹-[Val]²-Ciclosporin;
 1.33 [3'-O-acetyl-7'-desmethyl-7'-vinyl-cis-MeBmt]¹-[Nva]²-Ciclosporin; and
 1.34 [3'-O-acetyl-7'-desmethyl-7'-(3-bromo-n.propyl)-cis-MeBmt]¹-Ciclosporin;

A further group of cyclosporins of CLASS 1 are those:

- 1b) Wherein the β-carbon atom of the residue at the 2-position is O-acyl substituted, i.e. wherein the residue at the 2-position is a β-O-acyl-α-amino acid residue, and the residue at the 1-position is other than as defined under 1a) above.

When the residue at the 2-position is a β-O-acyl-α-amino acid residue, this residue will generally have the (L) configuration. Suitably it is a residue of formula III"

in which ACYL³ represents an acyl group. Preferably it is an O-acyl-(L)-threonyl residue.

Suitable groups as ACYL³ in formula III"', are those of the formula R₃—CO— or R₇—CO—R₈CO—, wherein R₃ has the meanings given for formula III, R₇ is the residue of a cyclosporin having a β-oxy-(L)-α-amino acid residue in the 2-position attached to the moiety —CO—R₈CO— via the β-oxygen atom of said residue, and R₈ is C₁₋₈-alkylene.

Alkylene groups as R₈ may be branched or straight chain. Preferably they are straight chain. R₈ is preferably C₁₋₄alkylene. Acyl groups of formula R₃—CO— are generally preferred, preferred significances for R₃—CO— being as hereinbefore set forth in relation to formula III.

Particular cyclosporins of this group are those of formula II as illustrated above, wherein A is -MeBmt- or -dihydro-MeBmt-, B is a residue as defined under 1b) above, e.g. of formula III"' as defined above, X is -Sar- and Y is -Val-.

Examples of such cyclosporins suitable for use in accordance with the present invention are:

- 1.35 [O-Acetyl-Thr]²-Ciclosporin; and
 1.36 1,2-Ethanedicarboxylic acid [O-threonyl]²-Ciclosporin di-ester.

Cyclosporin 1.36 has the formula VI

A further preferred group of cyclosporins of CLASS 1 are those:

1c) Wherein the 3'-carbon atom of the residue at the 1-position is oxo substituted. 15

When the 3'-carbon atom of the residue at the 1-position is oxo substituted this is suitably -3'-deoxy-3'-oxo-McBmt- of formula VII

Especially preferred cyclosporins of this group are those of formula II as illustrated above, wherein A is a residue of formula VII above, B has the meanings given for formula II, X is -Sar- and Y is -Val-.

A yet further group of cyclosporins of CLASS I are those: 1d) Wherein the β -carbon atom of the residue at the 2-position is β -oxo substituted, i.e. wherein the residue at the 2-position is a β -oxo- α -amino acid residue.

When the residue at the 2-position is a β -oxo- α -amino acid residue, this residue will generally have the (L) configuration. Suitably it is - α -methylketo-Gly- of formula VIII

Examples of cyclosporins belonging to groups 1c and 1d, suitable for use in accordance with the present invention are: 1.37 [3'-Desoxy-3'-oxo-McBmt]¹-Ciclosporin; 1.38 [3'-Desoxy-3'-oxo-McBmt]¹-[Val]²-Ciclosporin; 1.39 [3'-Desoxy-3'-oxo-McBmt]¹-[Nva]²-Ciclosporin; 1.40 [α -Methylketo-Gly]²-Ciclosporin; and 1.41 [Dihydro-McBmt]¹-[α -methylketo-Gly]²-Ciclosporin. Cyclosporins 1.37 to 1.39 are especially preferred.

Class 2

A cyclosporin wherein:

i) The 3'-carbon atom of the residue at the 1-position is C₁₋₄alkoxyimino substituted, e.g. a cyclosporin

wherein the residue at the 1-position is a -3'-deoxy-3'-(C₁₋₄alkoxyimino)-McBmt- residue; or

ii) The residue at the 2-position is an (L)-isoleucyl residue; or

iii) The residue at the 11-position is an N-methyl-(L)-alanyl, N-methyl-(L)-isoleucyl or N-methyl-(L)-alloisoleucyl or N-methyl-(L)-leucyl residue.

-3'-Desoxy-3'-(C₁₋₄alkoxyimino)-McBmt- residues as defined under (i) above have the formula IX

Wherein R₉ is C₁₋₄alkyl.

Alkyl groups as R₉ may be branched or straight chain. Preferably they are straight chain.

By N-methyl-(L)-alloisoleucyl (-McalloIle-) as used under (iii) above is meant the residue of formula X

Preferred cyclosporins of this class are those of formula XI

wherein

A is -McBmt-, -dihydro-McBmt- or a residue as defined under (i) above,

B is - α Abu-, -Thr-, -Val- or -Nva- or additionally, when A is -McBmt- or -dihydro-McBmt-, -Ile-, and

when

A is -McBmt- or -dihydro-McBmt- and

B is - α Abu-, -Thr-, -Val- or -Nva-,

Z is -McAla-, -Melle-, -McalloIle- or -McLeu-, or

when

A is a residue as defined under (i) above or

when

B is -Ile-,

Z is -MeVal-.

Examples of such cyclosporins suitable for use in accordance with the present invention are:

- 2.1 [3'-Desoxy-3'-methoxyimino-MeBmt]¹-Ciclosporin;
- 2.2 [Ile]²-Ciclosporin;
- 2.3 [MeAla]¹¹-Ciclosporin;
- 2.4 [MeIle]¹¹-Ciclosporin; and
- 2.5 [MealloIle]¹¹-Ciclosporin; and
- 2.6 [MeLeu]¹¹-Ciclosporin.

Of this class, cyclosporins wherein the residue at the 2-position has the meaning given under (ii) above, especially cyclosporin 2.2, are preferred.

Cyclosporins wherein the residue at the 11-position has the meaning given under (iii) above, e.g. cyclosporins 2.4 and 2.5, are also of particular interest.

Class 3

Cyclosporins of formula XI as illustrated above wherein:

Z is -Val- or -MeVal-;

when

Z is -Val-,

A is -MeBmt- or -dihydro-MeBmt-; or

when

Z is -MeVal-

A is -3'-desoxy-MeBmt-, 3'-desoxy-dihydro-MeBmt-, -N-desmethyl-MeBmt-, -N-desmethyl-dihydro-MeBmt-, -3'-desoxy-4'-desmethyl-dihydro-MeBmt- or -MeLeu-; and

when

Z is -Val-,

B is - α Abu- or -Thr-;

when

Z is -MeVal- and

A is -3'-desoxy-MeBmt-, -3'-desoxy-dihydro-MeBmt-, -3'-desoxy-4'-desmethyl-dihydro-MeBmt- or -MeLeu-,

B is - α Abu-; or

when

Z is -MeVal- and

A is -N-desmethyl-MeBmt- or -N-desmethyl-dihydro-MeBmt-,

B is -Thr-.

Cyclosporins of this class are:

- 3.1. [Val]¹¹-Ciclosporin (also known as cyclosporin E);
- 3.2. [Dihydro-MeBmt]¹-[Val]¹¹-Ciclosporin (or dihydrocyclosporin E);
- 3.3. [3'-Desoxy-MeBmt]¹-Ciclosporin (or cyclosporin F);
- 3.4. [3'-Desoxy-dihydro-MeBmt]¹-Ciclosporin (or dihydrocyclosporin F);
- 3.5. [N-Desmethyl-MeBmt]¹-[Thr]²-Ciclosporin (or cyclosporin P);
- 3.6. [N-Desmethyl-dihydro-MeBmt]¹-[Thr]²-Ciclosporin (or dihydrocyclosporin P);
- 3.7. [Thr]²-[Val]¹¹-Ciclosporin (or cyclosporin W);
- 3.8. [Dihydro-MeBmt]¹-[Thr]²-[Val]¹¹-Ciclosporin (or dihydrocyclosporin W);
- 3.9. [3'-Desoxy-4'-desmethyl-dihydro-MeBmt]¹-Ciclosporin (or cyclosporin Z);
- 3.10. [MeLeu]¹¹-Ciclosporin (or cyclosporin 28).

Various acylated cyclosporins of group 1a), in particular group 1a¹), and group 1b) are known. Thus cyclosporins 1.1, 1.4, 1.8, 1.9, 1.13, 1.14 and 1.34 are known from and are described, together with processes for their production, e.g. from Traber et al., *Helv. Chim. Acta*, 60, 1247 et seq. (1977), 65, 1655 et seq. (1982), 70, 13 et seq. (1987); Kobel et al.,

Europ. J. Applied Microbiology, Biotechnology 14, 273 et seq. (1982); and von Wartburg et al., *Progress in Allergy*, 38, 28 et seq. (1986).

Cyclosporins 1.2, 1.3, 1.5, 1.6, 1.7 and 1.10 are new and form part of the present invention as novel compounds per se. Cyclosporins 1.2, 1.5 to 1.7 and 1.10 may be prepared analogously to the methods described in the art, e.g. for the preparation of cyclosporin 1.1., by acetylation of the corresponding cyclosporins wherein the residue at the 1-position is -MeBmt- or -dihydro-MeBmt-. The cyclosporin starting materials are known, in the case of cyclosporins 1.6 and 1.7 from e.g. European patent publication no. 0 194 972. The product cyclosporins have the following physical characteristics:

15

Physical data:	
1.2	$[\alpha]_D^{20} = -328^\circ$ (c = 0.97 in CHCl ₃)
1.5	$[\alpha]_D^{20} = -250^\circ$ (c = 1.0 in CHCl ₃)
1.6	$[\alpha]_D^{20} = -302.6^\circ$ (c = 0.5 in CHCl ₃)
1.7	$[\alpha]_D^{20} = -296.2^\circ$ (c = 0.5 in CHCl ₃)
1.10	$[\alpha]_D^{20} = -293^\circ$ (c = 0.55 in CHCl ₃)

25

30

35

40

In general, when the residue at the 2-position in the cyclosporin starting material is a β -hydroxy- α -amino acid residue, for example -Thr-, the β -OH group at this position will be more readily susceptible to reaction than the 3'-hydroxy, e.g. of -MeBmt- or -dihydro-MeBmt-, at the 1-position. Cyclosporins wherein the residue at the 2-position, but not the residue at the 1-position, is acylated [as in the case of group 1b) cyclosporins, for example cyclosporin 1.35] or wherein both the residue at the 1- and 2-position is acylated [as in the case of cyclosporins 1.13 and 1.14 of group 1a¹] may thus be readily obtained, according to, or analogously to, the methods described in the art, taking advantage of this relative difference in reactivity. To produce cyclosporins wherein the 1-position is 3'-O-acylated but having a free β -OH group at 2-position [as in the case of cyclosporin 1.3] it is first necessary to protect the hydroxy group at the 2-position and then remove the protecting group subsequent to acylation of the residue at the 1-position. The following example is illustrative of the general procedure:

EXAMPLE A

45 Preparation of [3'-O-acetyl-MeBmt]¹-[Thr]²-Ciclosporin (Cyclosporin 1.3):

Step 1: introduction of an O-protecting group at -Thr-² of [Thr]²-Ciclosporin

6.09 g of [Thr]²-Ciclosporin are dissolved in 25 ml abs. CH₂Cl₂ and 5 ml ethyl-ether and 0.2 ml trifluoroacetic acid are added. The reaction mixture is stirred for 20 hrs. at room temperature under an atmosphere of nitrogen. The reaction mixture is shaken with cold, 20% KHCO₃, washed with water, extracted with CH₂Cl₂, dried over MgSO₄, filtered and evaporated. The obtained foam is purified chromatographically using 440 g silica gel (0.04-0.06) using toluene/acetone (2:1) as eluant and collecting in 500 ml fractions. The product, [Thr-1-methyl-ethoxymethyl ether]²-Ciclosporin is recovered from fractions 26 to 29: m.p. = 76.6° C.

60

Step 2: acylation of [Thr]²-Ciclosporin in -Thr-²O-protected form

10.66 g of the product of step 1, 106 ml acetic acid anhydride and 1.22 g of 4-dimethylaminopyridine are combined and stirred for 20 hrs. at room temperature and taken

65

up with toluene at 40° C. The residue is dissolved in 400 ml toluene and extracted 1× with 250 ml cold acetic acid, 1× with 250 ml H₂O, 1× with 200 ml cold 20% KHCO₃ and 1× with 250 ml H₂O. The toluene extracts are dried over MgSO₄, filtered evaporated and dried under vacuum to yield [3'-O-acetyl-McBmt]¹-[Thr-1-methyl-ethoxymethyl ether]²-Ciclosporin.

Step 3: deprotection of [3'-O-acetyl -McBmt]¹-[Thr]²-Ciclosporin in -Thr² O-protected form

11.38 g of the product of step 2, 80 ml tetrahydrofuran and 160 ml 67% acetic acid are stirred for 48 hrs. at room temperature under N₂. The reaction mixture is taken up in toluene, the residue dissolved in toluene, shaken with 20% KHCO₃, washed with H₂O and the toluene extracts dried over MgSO₄ and filtered. The filtrate is evaporated and purified chromatographically using 440 g silica gel (0.04-0.06) using toluene/acetone (3:1) as eluant and collecting in 500 ml fractions. The end-product, [3'-O-acetyl-McBmt]¹-[Thr]²-Ciclosporin is recovered from fractions 5-9: m.p.=75.6° C., [α]_D²⁰=-275.5° (c=0.65 in CHCl₃).

Cyclosporins of formula II' are new and form part of the present invention as novel compounds per se. Accordingly in a further aspect the present invention provides, as a novel group of cyclosporins, those:

1a⁴) Of the formula II' as hereinbefore defined.

Cyclosporins of group 1a⁴) may be prepared entirely analogously to the procedures for the production of known cyclosporins 1.1, 1.4 etc., hereinbefore referred to or analogously to the production of cyclosporin 1.3, starting from the corresponding cyclosporins wherein the residue at the 1-position is -McBmt- or -dihydro-McBmt. Required starting materials are known and described, together with the methods for their production, e.g. in UK patent application no. 2 155 936, U.S. Pat. No. 4,639,434 and European patent publication no. 0 056 782. As indicated above, cyclosporins of formula II', wherein W is the residue of a β-hydroxy- (rather than β-O-acyl-) -α-amino acid residue are prepared analogously e.g. to example A, by first protecting at the 8-position, acylating at the 1-position and then de-protecting at the 8-position.

Cyclosporin 1.15 of group 1a⁴) has the following characterising data: [α]_D²⁰=-272° (c=1.0 in CHCl₃).

Cyclosporins wherein the 3'-carbon atom of the residue at the 1-position is azidoalkylcarbonyloxy or alkoxy-carbonyloxy substituted are also new and form part of the present invention as novel compounds per se.

A group of cyclosporins of this type comprises those:

1a⁵) Wherein the residue at the 1-position is a -3'-O-(C₁₋₄-azidoalkyl)-carbonyl- or -3'-O-(C₁₋₄-alkoxy)-carbonyl-McBmt- or -dihydro-McBmt- residue, i.e. of formula I as illustrated above, wherein ACYL¹ is a group of formula R₁'-CO- or R₂'-O-CO- wherein R₁' is C₁₋₄-azidoalkyl and R₂' is C₁₋₄-alkyl.

Preferred cyclosporins of this group are those of formula II as illustrated above, wherein A is a residue as defined under 1a⁵ above, B has the meanings given for formula II, X is -Sar- and Y is -Val-.

The present invention also provides a process for the production of cyclosporins of group 1a⁵) which process comprises:

a) reacting the corresponding cyclosporin wherein the residue at the 1-position is -McBmt- or -dihydro-McBmt- with a compound of formula XII or XIII.

Wherein R₁' and R₂' have the meanings given above and Q is a leaving group.

Q is suitably halogen or -OH. When Q is halogen, reaction is suitably carried out e.g. in the presence of a catalyst such as n-butyllithium. When Q is -OH reaction is suitably carried out in the presence of an activating agent. Reaction is suitably performed at temperatures of from ca -100° to -50° C., e.g. as described in the following examples B:

EXAMPLES B

1. Preparation of [3'-O-methoxycarbonyl-McBmt]¹-Ciclosporin (cyclosporin 1.11)

3.76 ml of a 1.48M solution of n-butyllithium in 3.76 ml hexane are added to 0.87 ml diisopropylamine in tetrahydrofuran at -78° and the whole stirred for 30 min. at -78° C. 1.0 g Ciclosporin in 15 ml dry tetrahydrofuran are added at the same temperature and stirring continued for a further 30 min. 0.326 ml methyl chloroformate are added and stirring continued for a further 1 hour at -78° C. The temperature is then allowed to rise to room temperature. 10 ml of water are added and most of the tetrahydrofuran removed by evaporation. The residue is taken up in 100 ml ethyl ether and 50 ml water, the aqueous layer separated and extracted 2× with ethyl ether. The combined organic extracts are dried over MgSO₄ and evaporated to dryness. The residue is purified chromatographically on silica gel, eluting with ethyl acetate, to yield the title compound: [α]_D²⁰=-234° (c=1.0 in CHCl₃).

2. Preparation of [3'-O-(4-azidobutanoyl)-McBmt]¹-Ciclosporin (cyclosporin 1.12)

7.74 g γ-azidobutyric acid, 8.6 g 4-dimethylaminopyridine and 5.11 g Mullayama-reagent (2-chloro-1-methylpyridinium iodide) are added to 12.02 g Ciclosporin in 200 ml abs. CH₂Cl₂, and the reaction mixture is stirred for 90 hrs. at room temperature. The obtained product is diluted with CH₂Cl₂ shaken with 100 ml ice-cold, 10% NaOH, 200 ml H₂O and 200 ml 10% acetic acid washed with water, and the organic phases are dried over Na₂SO₄. The filtrate is evaporated and dried again. The product is purified chromatographically using 1.2 kg silica gel (0.04-0.06 mm) using hexane/acetone (3:1) as eluant collecting in fractions of 250 ml up to fraction 20 and then hexane/acetone (7:3), collecting in fractions of 300 ml thereafter. The title compound is recovered from fractions 23-27: [α]_D²⁰=-289.8° (c=0.5 in CHCl₃).

Cyclosporins of group 1a² as hereinbefore set forth are also new and form part of the present invention as novel compounds per se.

The present invention also provides a process for the production of cyclosporins of group 1a²) which process comprises:

b) acylating the corresponding cyclosporin wherein the residue at the 1-position is an -8'-C₁₋₈-alkoxy-cis-McBmt- or -8'-C₁₋₈-alkoxy-dihydro-McBmt- residue of formula XIV

wherein —x—y— and R_4 have the meanings given above for formula IV, for example acylating a cyclosporin of formula II as illustrated above wherein A is a residue of formula XIV as defined above, B has the meanings given for formula II, X is -Sar- and Y is -Val-, e.g. by reaction with a compound of formula XV

wherein R_5 is C_{1-4} alkyl and Q is a leaving group, for example a halogen atom; or

c) for the preparation of a cyclosporin of group 1a² wherein the residue at the 1-position is a -3'-O-acyl-8'- C_{1-8} -alkoxy-cis-MeBmt- residue of formula IV as illustrated above, wherein —x—y— is cis —CH=CH—, R_4 has the meaning given for formula IV and ACYL¹ is an acyl O-protecting group, for example acetyl, reacting a cyclosporin wherein the residue at the 1-position is a -3'-O-acyl-5'-des-(1-propenyl)-5'-formyl-MeBmt- residue of formula XVI

wherein R_{10} is an acyl O-protecting group, e.g. acetyl, for example a cyclosporin of formula II as illustrated above wherein A is a residue of formula XVI as defined above, B has the meanings given for formula II, X is -Sar- and Y is -Val-, with a compound of formula XVII

wherein each R_{11} is phenyl or C_{1-4} alkyl and R_4 has the meaning given for formula IV.

Reaction in accordance with process step (c) above may be carried out in accordance with standard methods employed for effecting a Wittig reaction, e.g. under anhydrous conditions, for example in an inert solvent or diluent such as absolute benzene, tetrahydrofuran, ethyl-ether or toluene, at a temperature of from about -80° C. to 20° C., optionally in the presence of a salt, e.g. an alkali-metal halogenide. The reaction is suitably carried out under an inert atmosphere.

The cyclosporin starting materials required for process step (c) may be obtained from the corresponding cyclosporins wherein the residue at the 1-position is -3'-O-acyl-protected-MeBmt-, for example -3'-O-acetyl-MeBmt- by:

d) ozonolysis and treatment of the immediately obtained ozonolysis product with a mild reducing agent.

Ozonolysis in accordance with reaction step (d) may be carried out in accordance with standard techniques, e.g. in an ozonisor in the presence of, e.g. ethyl acetate or dichloromethane, at a temperature of from about -90° to about -40° C. A suitable mild reducing agent is dimethyl sulfide. Suitably, ozonolysis and treatment with the mild reducing agent is carried out in a single reaction vessel, e.g. as described in the following examples C.

The starting materials for process step (d) are cyclosporins of group 1a¹ and are known or may be obtained as hereinbefore described.

Process step (b) may be carried out analogously to processes for the production of cyclosporins of groups 1a¹) and 1b) as hereinbefore described, e.g. with reference to the literature. Similarly cyclosporins of group 1a²) having a free β -hydroxy- α -amino acid residue, e.g. -Thr-, at the 2-position may be produced by intermediate protection and subsequent deprotection of the β -OH group, e.g. proceeding analogously to the methods described in relation to example A above. The starting materials for process step (b) above may be obtained by:

e) deprotection of the corresponding cyclosporin wherein the residue at the 1-position is an -8'- C_{1-8} alkoxy-cis-MeBmt- or -8'- C_{1-8} alkoxy-dihydro-MeBmt- residue in 3'-O-protected form; or

f) reduction of the corresponding cyclosporin wherein the residue at the 1-position is an -8'- C_{1-8} alkoxy-cis-MeBmt- residue in free or 3'-O-protected form and, when required, carrying out process step (e).

Suitable 3'-O-protecting groups in the starting materials for process step (e) include any of those known and commonly employed in the art of peptide chemistry including acyl and ether protecting groups. The starting materials for process step (e) thus include the products of process step (c) hereinbefore described. Corresponding starting materials wherein the 3'-O-protecting group is other than acyl may be obtained analogously to process steps (d) and (c) starting from the appropriate 3'-O-protected cyclosporins.

Process step (e) itself can be carried out in accordance with procedures commonly employed in the art of peptide chemistry, e.g. by hydrolysis in the presence of a base such as an alkali metal alkoxide or carbonate to remove acetyl protecting groups or hydrolytic ether cleavage, e.g. in the presence of trifluoro-acetic acid or HCl to remove protecting ether groups. Process step (e) is suitably conducted at temperatures of from about -20° to about 20° C., e.g. as hereinafter described in examples D.

Process step (f) may also be carried out analogously to known methods, e.g. for reducing naturally occurring cyclosporins to the corresponding dihydrocyclosporins, for example by catalytic hydrogenation, e.g. in accordance with the general methods disclosed in U.K. Patent Specification No. 1 567 201. Hydrogenation is suitably effected under neutral pH conditions at temperatures of from about 20° to about 30° C. and at atmospheric or slightly elevated pressure, in the presence of a catalyst such as platinum or, preferably, palladium (e.g. palladium on charcoal) in the presence of an inert solvent or diluent such as ethyl acetate or lower aliphatic alkanols such as methanol and isopropanol.

The cyclosporin starting materials for process step (b) are also new and form part of the present invention as novel compounds per se. In a further aspect the present invention accordingly also provides:

Class 4

A cyclosporin wherein the residue at the 1-position is an -8'-alkoxy-cis-McBmt- or -8'-C₁₋₈-alkoxy-dihydro-McBmt-residue of formula XIV as defined above.

Preferred cyclosporins of this class are those of formula II as defined for process step (b).

In addition to their utility as intermediates, cyclosporins of class 4 also possess, e.g. immunosuppressive, anti-inflammatory and anti-parasitic activity as hereinafter described. The said cyclosporins thus have utility in their own right.

Cyclosporins of class 4 also exhibit activity in increasing sensitivity to, or increasing the efficacy of, chemotherapeutic drug therapy and, in particular in reversing chemotherapeutic drug resistance, e.g. resistance to anti-neoplastic or cytostatic chemotherapy, as herein disclosed for cyclosporins of classes 1 to 3. Having regard e.g. to their inherent immunosuppressive properties however, cyclosporins of class 4 are generally less suitable for use in such indications.

The cyclosporin starting materials for process step (c) are also new and form part of the present invention as novel compounds per se. These starting materials may, of course, be subjected to intervening de-protection and/or re-protection, e.g. for the purposes of handling, transport or storage, in accordance with methods known or practiced in the art. In a yet further aspect the present invention accordingly also provides:

Class 5

A cyclosporin wherein the residue at the 1-position is -5'-des-(1-propenyl)-5'-formyl-McBmt- in free or in 3'-O-protected form, i.e. a residue of formula XVIII

wherein R₁₂ is hydrogen or an O-protecting group.

Preferred protecting groups as R₁₂ are acyl O-protecting groups, e.g. acetyl. Preferred cyclosporins of this class are those of the formula II as illustrated above, wherein A is a residue of formula XVIII as defined above, B has the meanings given for formula II, X is -Sar- and Y is -Val-.

When R₁₂ is hydrogen, the residue of formula XVIII also exists in the cyclic tautomeric form of formula XVIII':

Such tautomers are to be understood as being within the purview of the present invention, e.g. embraced by the definition for class 5 cyclosporins above.

The following examples are illustrative of the above processes for the preparation of cyclosporins of group 1a² and of classes 4 and 5.

EXAMPLES C

Preparation of cyclosporins of group 1a².

Preparation of [3'-O-acetyl-8'-methoxy-cis-McBmt]¹-Ciclosporin (cyclosporin 1.16):

16 g Methoxymethyltriphenylphosphoniumbromide are suspended in 270 ml absolute tetrahydrofuran (THF) in argon and cooled to -75° C. A solution of 5 g potassium t.butylate in 200 ml absolute THF is added dropwise over 30 minutes and the mixture is stirred again. After 2 hours a solution of 10 g of [3'-O-acetyl-5'-des-(1-propenyl)-5'-formyl-McBmt]¹-Ciclosporin in 25 ml THF is added dropwise over 20 minutes. The mixture is stirred for 4 hours at room temperature, then treated with 400 ml ethyl acetate. The extracts are washed with 2N HCl solution, saturated NaHCO₃ and saturated brine. The concentrated filtrate is chromatographed on 1.2 kg and 0.44 kg silica gel (0.04 to 0.063 mm) with CHCl₃ (10-40%) acetone/ethyl acetate to give the title compound: [α]_D²⁰ = -267° (c=0.53 in CHCl₃).

Cyclosporins 1.17 to 1.21 may be prepared analogously. These have the following physical characteristics:

Physical data:	
1.17	[α] _D ²⁰ = -283° (c = 0.544 in CHCl ₃)
1.18	[α] _D ²⁰ = -209.1° (c = 0.605 in CHCl ₃)
1.19	[α] _D ²⁰ = -282.96° (c = 0.405 in CHCl ₃)
1.20	[α] _D ²⁰ = -268° (c = 0.615 in CHCl ₃)
1.21	[α] _D ²⁰ = -248.7° (c = 0.65 in CHCl ₃)

The starting material for the above process, which is a cyclosporin of class 5, is produced as follows:

Production of [3'-O-acetyl-5'-des-(1-propenyl)-5'-formyl-McBmt]¹-Ciclosporin (cyclosporin 5.1):

48.5 g of [3'-O-acetyl-McBmt]¹-Ciclosporin in 70 ml ethyl acetate are ozonised for 45 mins. at -70° C., using a Fischer ozone generator at 0.4 atm. with a current flow of 110 l/h. The obtained solution is gassed with N₂ and 9.8 ml dimethylsulfide are added. The solution is stirred for 2 hrs. at room temperature, concentrated by evaporation, washed 2x with benzene and dried under high vacuum to yield the desired product. This is used directly for further reaction without further purification: [α]_D²⁰ = -302° (c=1.15 in CHCl₃).

The following cyclosporins are obtained analogously

5.2 [3'-O-acetyl-5'-des-(1-propenyl)-5'-formyl-McBmt]¹-[O-acetyl-Thr]²-Ciclosporin: [α]_D²⁰ = -272.6° (c=0.504 in CHCl₃), m.p.=156°-160°

5.3 [3'-O-acetyl-5'-des-(1-propenyl)-5'-formyl-McBmt]¹-[Val]²-Ciclosporin: [α]_D²⁰ = -306° (c=1.03 in CHCl₃), m.p.=168°-170°

5.4 [3'-O-acetyl-5'-des-(1-propenyl)-5'-formyl-McBmt]¹-[Nva]²-Ciclosporin: [α]_D²⁰ = -291.76° (c=0.51 in CHCl₃).

EXAMPLES D

60 Preparation of cyclosporins of class 4.

Preparation of [8'-methoxy-cis-McBmt]¹-Ciclosporin (cyclosporin 4.1): 4 g of cyclosporin 1.16 (from examples C) in 41 ml methanol/water (5:1) are heated with 3.5 g potassium carbonate and stirred at room temperature. After 21 hours the cooled solution is made acid with 10% tartaric acid solution and extracted three times with CHCl₃. The extracts are washed with saturated NaHCO₃ and water and dried

over Na_2SO_4 and concentrated. Chromatography on 220 g silica gel with ethyl acetate and ethyl acetate/hexane (100 to 20%) gives the title compound: $[\alpha]_D^{20} = -239^\circ$ ($c=0.53$ in CHCl_3).

The following cyclosporins are obtained analogously:

4.2 [8'-t.Butoxy-cis-MeBmt]¹-Ciclosporin: $[\alpha]_D^{20} = -228^\circ$ ($c=0.5$ in CHCl_3);

4.3 [8'-Methoxy-cis-MeBmt]¹-[Thr]²-Ciclosporin: $[\alpha]_D^{20} = -220^\circ$ ($c=0.37$ in CHCl_3);

4.4 [8'-t.Butoxy-cis-MeBmt]¹-[Thr]²-Ciclosporin: $[\alpha]_D^{20} = -221^\circ$ ($c=0.43$ in CHCl_3);

4.5 [8'-Methoxy-cis-MeBmt]¹-[Val]²-Ciclosporin: $[\alpha]_D^{20} = -241^\circ$ ($c=0.54$ in CHCl_3);

4.6 [8'-Methoxy-cis-MeBmt]¹-[Nva]²-Ciclosporin: $[\alpha]_D^{20} = -236^\circ$ ($c=0.634$ in CHCl_3);

Production of [8'-methoxy-dihydro-MeBmt]¹-Ciclosporin (cyclosporin 4.7).

302 mg of cyclosporin 4.1 are dissolved in 10 ml abs. ethanol and hydrogenated at room temperature and atmospheric pressure over 5% Pd on charcoal. After the uptake of the theoretical amount of hydrogen (50 min.), the catalyst is separated by filtration over hyflo, and the solvent evaporated at reduced pressure. The residue is chromatographed on 70 g silica gel ($O=0.015$ mm) with hexane-acetone (1:1) yielding the title compound: $[\alpha]_D^{20} = -229^\circ$ ($c=0.52$ in CHCl_3).

The following cyclosporins are obtained analogously:

4.8 [8'-Methoxy-dihydro-MeBmt]¹-[Thr]²-Ciclosporin: $[\alpha]_D^{20} = -217.5^\circ$ ($c=0.32$ in CHCl_3);

4.9 [8'-Methoxy-dihydro-MeBmt]¹-[Val]²-Ciclosporin: $[\alpha]_D^{20} = -223.6^\circ$ ($c=0.58$ in CHCl_3);

4.10 [8'-Methoxy-dihydro-MeBmt]¹-[Nva]²-Ciclosporin: $[\alpha]_D^{20} = -221.5^\circ$ ($c=0.594$ in CHCl_3).

Cyclosporins of group 1a³ as hereinbefore set forth are also new and form part of the present invention as novel compounds per se.

The present invention also provides a process for the production of cyclosporins of group 1a³, which process comprises:

g) acylating the corresponding cyclosporin wherein the residue at the 1-position is -cis-MeBmt-; a -7'-desmethyl-7'-hydrocarbyl- -MeBmt- or -cis-MeBmt- residue wherein the hydrocarbyl moiety comprises at least two carbon atoms; or a -7'-desmethyl-7'-hydrocarbyl-dihydro-MeBmt- residue wherein the hydrocarbyl moiety comprises at least two carbon atoms and wherein any aliphatic group or moiety present as or in said hydrocarbyl moiety is saturated, which residue may be represented by the formula XIX

wherein —x—y— and R_6 have the meanings given above for formula V, for example, acylating a cyclosporin of formula II as illustrated above wherein A is a residue of formula XIX as defined above, B has the meanings given for formula II, X is -Sar- and Y is -Val-, e.g. by reaction with a compound of formula XV as defined above; or

h) for the preparation of a cyclosporin of group 1a³ wherein the residue at the 1-position is -3'-O-acyl-cis-

MeBmt- wherein the acyl moiety is an acyl O-protecting group, or a -7'-desmethyl-7'-hydrocarbyl- -MeBmt- or -cis-MeBmt- residue wherein the hydrocarbyl moiety comprises at least two carbon atoms and wherein the O-acyl moiety is an acyl O-protecting group, which residue may be represented by the formula V as illustrated above wherein —x—y— is cis or trans —CH=CH—, R_6 has the meaning given for formula V and ACYL¹ is an acyl O-protecting group, for example acetyl, reacting a cyclosporin wherein the residue at the 1-position is a -3'-O-acyl-5'-des-(1-propenyl)-5'-formyl-MeBmt- residue of formula XVI as defined above, for example a cyclosporin of formula II as illustrated above, wherein A is a residue of formula XVI as defined above, B has the meanings given for formula II, X is -Sar- and Y is -Val-, with a compound of formula XX

Wherein each R_{11} is phenyl or C_{1-4} alkyl and R_6' is hydrocarbyl of at least 2 carbon atoms and, when required, isolating the desired reaction product.

Process steps (g) and (h) may be carried out in exactly analogous fashion to process steps (b) and (c) above, for example as hereinafter described in examples E below. The starting materials for process step (g) may be obtained entirely analogously to process step (e) or (f) above by:

i) deprotection of the corresponding cyclosporin wherein the residue at the 1-position is -3'-O-acyl-cis-MeBmt- or, a -7'-desmethyl-7'-hydrocarbyl- -MeBmt- or -cis-MeBmt- residue wherein the hydrocarbyl moiety comprises at least two carbon atoms, said residue being in 3'-O-protected form; or

j) reduction of the corresponding cyclosporin wherein the residue at the 1-position is a -7'-desmethyl-7'-hydrocarbyl- -MeBmt- or -cis-MeBmt- residue, said residue being in free or 3'-O-protected form and, when required, carrying out process step (i).

Suitable 3'-O-protecting groups are as hereinbefore described in relation to process steps (e) and (f). In carrying out process step (j) unsaturated linkages in the hydrocarbyl moiety will undergo reduction, together with the group —x—y—. Alternatively, cyclosporin starting materials wherein the residue at the 1-position is -cis-MeBmt- may be obtained in accordance with the total synthetic method for the production of cyclosporins, e.g. as described in European patent publication no. 0 034 567 or U.S. Pat. No. 4,369,542.

The cyclosporin starting materials for process step (g) wherein the residue at the 1-position is other than -cis-MeBmt- are also new and form part of the present invention as novel compounds per se. In a further aspect the present invention accordingly also provides:

Class 6

A cyclosporin wherein the residue at the 1-position is a -7'-desmethyl-7'-hydrocarbyl- -MeBmt- or -cis-MeBmt- residue wherein the hydrocarbyl moiety comprises at least two carbon atoms, or a -7'-desmethyl-7'-hydrocarbyl-dihydro-MeBmt- residue wherein the hydrocarbyl moiety comprises at least two carbon atoms and wherein any aliphatic group or moiety as or in said hydrocarbyl moiety is saturated, which residue may be represented by formula XIX'

charcoal at room temperature during 6 hours. Filtration over Hyflo yields the pure title compound: $[\alpha]_D^{20} = -210^\circ$ ($c=0.7$ in CHCl_3).

The following cyclosporins are obtained analogously:

- 6.14 [7'-Desmethyl-7'-n.propyl-dihydro-MeBmt]¹-Ciclosporin: $[\alpha]_D^{20} = -188^\circ$ ($c=6.16$ in CHCl_3), obtained from cyclosporin 6.6 or 6.7;
- 6.15 [7'-Desmethyl-7'-ethyl-dihydro-MeBmt]¹-[Thr]²-Ciclosporin: $[\alpha]_D^{20} = -224^\circ$ ($c=0.4$ in CHCl_3), obtained from cyclosporin 6.4;
- 6.16 [7'-Desmethyl-7'-(3-methyl-n.butyl)-dihydro-MeBmt]¹-Ciclosporin: $[\alpha]_D^{20} = -222^\circ$ ($c=0.995$ in CHCl_3), obtained from cyclosporin 6.5;
- 6.17 [7'-Desmethyl-7'-i.propyl-dihydro-MeBmt]¹-Ciclosporin: $[\alpha]_D^{20} = -229^\circ$ ($c=1.32$ in CHCl_3);
- 6.18 [7'-Desmethyl-7'-ethyl-dihydro-MeBmt]¹-[Val]²-Ciclosporin: $[\alpha]_D^{20} = -232.9^\circ$ ($c=0.48$ in CHCl_3), obtained from cyclosporin 6.10;
- 6.19 [7'-Desmethyl-7'-ethyl-dihydro-MeBmt]¹-[Nva]²-Ciclosporin: $[\alpha]_D^{20} = -227.29^\circ$ ($c=0.54$ in CHCl_3), obtained from cyclosporin 6.11;
- 6.20 [7'-Desmethyl-7'-phenyl-dihydro-MeBmt]¹-[Val]²-Ciclosporin: $[\alpha]_D^{20} = -214^\circ$ ($c=1.19$ in CHCl_3), obtained from cyclosporin 6.8 or 6.9;
- 6.21 [7'-Desmethyl-7'-ethyl-dihydro-MeBmt]¹-Ciclosporin: $[\alpha]_D^{20} = -233^\circ$ ($c=1.15$ in CHCl_3), obtained from cyclosporin 6.33;

As will be apparent, cyclosporins of groups 1a² and 1a³ and of classes 4, 5 and 6 herein before described, all of which are novel, are structurally related and may, for convenience, readily be subsumed into unified categories, e.g. comprising cyclosporins wherein the residue at the 1-position is a residue of formula XXI

wherein

- (i) R_a is formyl and R_b has the meanings given for R_{12} in relation to formula XVIII; or
- (ii) R_a is $-y'-x'-R_c$ whereby $-y'-x'-R_c$ has the meanings given for $-y-x-R_4$, $-y-x-R_6$, or $-y-x-R_6''$ in relation to formulae IV, V, XIV and XIX' above and R_b is hydrogen or acyl.

Similarly cyclosporins of groups 1a² and 1a³ and of classes 4 and 6, all of which are novel and have utility other than as intermediates can be subsumed into unified sub-categories, e.g. comprising cyclosporins wherein the residue at the 1-position is a residue of formula XXI as illustrated above, wherein R_a and R_b have the meanings given under (ii) for formula XXI.

Acyl groups as R_b are preferably groups ACYL¹ as defined in relation to formulae III and IV, in particular (C₁₋₄alkyl)-carbonyl, e.g. acetyl.

Preferred cyclosporins of such categories/sub-categories are those of formula II as illustrated above wherein A is a residue of formula XXI as defined above and B has the meanings given for formula II, X is -Sar- and Y is -Val-.

Various cyclosporins of group 1b) as hereinbefore set forth, e.g. wherein the residue at the 2-position is a residue of formula III' as illustrated above in which ACYL³ is acetyl

are known. Thus cyclosporin 1.35 is known and has been described, together with processes for its production in Traber et al., Helv. Chim. Acta, 60, 1247 at seq. (1977). Other cyclosporins of group 1b may be prepared analogously. Cyclosporin 1.36 however is of an entirely novel type. A still further group of cyclosporin in accordance with the present invention accordingly comprises.

Group 1e)

- i) A dicarboxylic acid di-ester of a cyclosporin having a β -hydroxy-(L)- α -amino acid residue at the 2-position; in particular:
- ii) A dicarboxylic acid di-ester of a cyclosporin having an (L)-threonyl residue at the 2-position; and especially
- iii) A dicarboxylic acid di-ester of formula XXII

(XXII)

wherein R_{13} is C₁₋₈alkylene and each CY represents a residue of formula II as illustrated above wherein

A is -MeBmt- or -dihydro-MeBmt-

B is an (L) threonyl residue of formula XXIII

(XXIII)

X is -Sar- and Y is -Val-.

Preferably R_{13} is C₁₋₄alkylene.

The present invention also provides a process for the preparation of a cyclosporin of group 1e which process comprises

- k) reacting a β -O-hemiester of a cyclosporin wherein the residue at the 2-position is a β -hydroxy-(L)- α -amino acid residue, for example a β -O-hemiester of formula XXIV

(XXIV)

wherein CY and R_{13} have the meanings given above, or a reactive functional derivative thereof, with a cyclosporin wherein the residue at the 2-position is a β -hydroxy-(L)- α -amino acid residue, for example a cyclosporin of formula II as illustrated above, wherein A is -MeBmt- or -dihydro-MeBmt-, B is -Thr-, X is -Sar- and Y is -Val-.

Reaction may suitably be effected in accordance with the general procedures of the following example G.

EXAMPLE G

Preparation of 1,2-ethanedicarboxylic acid [O-(L)threonyl]²-Ciclosporin di-ester (cyclosporin 1.36)

0.255 g 2-chloro-1-methyl-pyridinium iodide and 0.244 g 4-dimethylamino pyridine are added to 1.318 g [(O-hemisuccinyl)-Thr]²-Ciclosporin in 5 ml absolute CH_2Cl_2 at 0° C. 1.218 g [Thr]²-Ciclosporin are added, the reaction

mixture stirred for 3 hrs. at 0° C., and the temperature allowed to rise to 20° C. with further stirring. The reaction mixture is diluted with CH₂Cl₂ and shaken with 10 ml 0.1N NaOH with added ice. The mixture is washed 2× with H₂O and the organic phase dried over Na₂SO₄ filtered and evaporated. The raw product is purified chromatographically employing silica gel and hexane/acetone (1:1) as eluant to yield the title compound: $[\alpha]_D^{20}$: -209.4° (c=0.5 in CHCl₃).

The [(O-hemisuccinyl)Thr]²-Ciclosporin required as starting material is known—see e.g. International Patent Application No. PCT/EP85/00501. International Patent Publication No. W086/02080, example 5. Other hemiester starting materials suitable for the preparation of cyclosporins of group 1c may be prepared analogously.

Cyclosporins of group 1c as hereinbefore set forth are new and form part of the present invention as novel compounds per se.

The present invention also provides a process for the production of cyclosporins of group 1c, which process comprises:

- 1) oxidising a cyclosporin wherein in the residue at the 1-position is 3'-hydroxy substituted for example is -McBmt-

Step 1) above may be performed e.g. by reaction with N-chloro-succinimide/dimethylsulfide at a temperature of e.g. -30° to 10° C., e.g. in accordance with the procedures of example H below.

EXAMPLE H

Preparation of [3'-desoxy-3'-oxo-McBmt]¹-Ciclosporin (Cyclosporin 1.37)

8.48 ml dimethylsulfide are added at 0° C. to a solution of 12.8 g N-chlorosuccinimide in 400 ml toluene. The mixture is stirred for 5 mins at 0° C., cooled to -12° C. and 9.62 g Ciclosporin in 40 ml toluene are added. The obtained suspension is stirred for 1.5 hrs. at -10° C. and for 1.0 hrs. at -10° to -5° C. 19.4 g triethylamine are added, whereupon a light precipitate forms. The mixture is stirred for 5 hrs. at 0° C., and diluted with 250 ml ethyl ether. 192 ml 1N HCl are added cold and extracted. The organic phase is washed 2× with 500 ml H₂O, shaken with 250 ml 10% cold NaHCO₃ and washed 2× with 500 ml H₂O, 250 ml 10% tartaric acid and again with H₂O. The acid and basic aqueous solutions are re-extracted with 2×500 ml ethyl ether. The combined organic phases are dried over Na₂SO₄ and evaporated to dryness at 40° C. The residue is purified chromatographically employing 300 g silica gel and saturated aqueous ethyl acetate to yield the title compound: $[\alpha]_D^{20}$ = -241.3° (c=0.531 in CHCl₃) and -169.5° (c=0.5 in CH₃OH). Cyclosporins 1.38 and 1.39 may be prepared analogously:

Physical data:

1.38	$[\alpha]_D^{20}$ = -255.1° (c = 0.5 in CHCl ₃)
1.39	$[\alpha]_D^{20}$ = -235.4° (c = 0.5 in CHCl ₃)

Cyclosporins of group 1d as hereinbefore set forth are also new and also form part of the present invention as novel compounds per se.

The present invention also provides a process for the production of cyclosporins of group 1d, which process comprises:

- m) oxidising, e.g. selectively oxidising, a cyclosporin wherein the residue at the 2-position is a β-hydroxy-α-amino acid residue, for example an (L)-threonyl residue.

Process step (m) may be carried out entirely analogously to process step (1) above, e.g. in accordance with the general procedures of the following example I.

EXAMPLE I

Preparation of [α-Methylketo-Gly]²-Ciclosporin (Cyclosporin 1.40)

484 mg dimethylsulfide are added to 868 mg N-chlorosuccinimide in 26 ml toluene at 0° C. After stirring for 10 mins. at 0° C. the suspension is cooled to -30° C. and 1584 mg [Thr]²-ciclosporin in 6.5 ml toluene are added. The reaction mixture is stirred for 1 hr. at 26°-30° C. and 1.81 ml triethylamine are added. Cooling is removed and after a further 5 mins. 25 ml ethyl ether are added. The reaction mixture is poured onto 150 ml ice water/10 ml 1N HCl and stirred and a further 100 ml ethyl ether are added. The organic phase is washed 3× with 150 ml ice water and extracted 2× with ethyl ether. The combined organic phases are dried over Na₂SO₄ and concentrated. The residue is dissolved in 10 ml CH₂Cl₂, filtered through Hyflo, diluted with hexane and evaporated to yield the title compound: $[\alpha]_D^{20}$ = -229° (c=1.0 in CHCl₃) and -184.8° (c=1.0 in CH₃OH).

Cyclosporin 1.41 may be prepared analogously: $[\alpha]_D^{20}$ = -226.7° (c=1.0 in CHCl₃).

Cyclosporins of class 2(i) and of class 2(ii) as hereinbefore set forth are also new and form part of the present invention as novel compounds per se.

In addition the present invention also provides a process for the production of cyclosporins of class 2(i) and 2(ii), which process comprises:

- m) for the production of a cyclosporin of class 2(i), reacting a cyclosporin wherein the 3'-carbon atom of the residue at the 1-position is oxo-substituted, e.g. a cyclosporin wherein the residue at the 1-position is -3'-desoxy-3'-oxo-McBmt- with a C₁₋₄alkoxyamine, or
- n) for the production of a cyclosporin of class 2(ii), cyclising an open-chain peptide comprising the sequence of a cyclosporin comprising an (L)-isoleucyl residue at the 2-position, said open-chain peptide commencing with the residue corresponding to residue 8 of said cyclosporin as N-terminal and terminating with the residue corresponding to residue 7 of said cyclosporin as C-terminal, for example cyclising an open-chain peptide comprising the sequence

viral, antifungal or anti-protozoal) chemotherapy and, especially anti-cancer or anti-tumor (c.g. anti-neoplastic or cytostatic) chemotherapy. They are accordingly useful, c.g. as a means of reducing regular chemotherapeutic dosage levels, for example, in the case of anti-neoplastic or cytostatic drug therapy, as a means of decreasing overall drug toxicity and, more especially, as a means of reversing or reducing resistance, including both inherent and acquired resistance, to chemotherapy.

EXAMPLE 1

Utility in restoring sensitivity to anti-neoplastic/cytotoxic, anti-tumor drug substances (in vitro-1)

Cancer cell lines (CCL), c.g. from human small cell carcinoma of the lung, resistant to one or more cancer therapeutic drug substances (CTDS) selected from the group comprising Daunorubicin (DR); Vincristine (VC); Adriamycin (AM); Etoposide (ET); Tenoposide (TE); and Colchicine (CC) are developed in accordance with the methods described by Twentyman et al., Br. J. Cancer, 54, 253 (1986).

Sensitivity of resistant sub-lines (CCL-R) is compared with parental sensitive lines (CCL-S) by assaying inhibition of cell growth during continuous CTDS exposure, c.g. in the case of a DR-resistant line (CCL-DRR) by comparing growth of CCL-DRS and CCL-DRR lines in the presence of DR contained in the growth medium ab-initio. For the purpose, cell proliferation is measured by cell counting using an electronic cell counter, counting being effected close to termination of the exponential growth phase. CCL-R lines are selected for which the IC_{80} (drug concentration e.g. DR concentration, required to reduce final cell number to 20% of that for non-CTDS (c.g. DR) treated controls is $<80 X$, preferably $>100 X$, greater than that of parental CCL-S lines.

Sensitivity of selected CCL-R lines to CTDS (c.g. DR) in the presence and absence of test cyclosporin is then performed, employing cell count as a measure of proliferation as described above. For this purpose cells are cultured ab initio in the presence of varying concentrations of both CTDS and test cyclosporin. For screening, concentrations of the latter are chosen which do not themselves cause a significant reduction in proliferation. Appropriate concentrations are established by culturing CCL-S and CCL-R in the presence of varying concentrations of cyclosporin in the absence of CTDS. Cyclosporins are routinely tested at concentrations of from 0.01 to 50, in particular 0.1 to 10, $\mu\text{g/ml}$, c.g. at concentrations of 0.01, 0.02, 0.05, 0.1, 0.2, 0.5, 1.0, 2.0, 5.0, 10.0 and 50 $\mu\text{g/ml}$. The ratio of CTDS (c.g. DR) required to inhibit cell proliferation by 50% in the absence of test cyclosporin ($IC_{50}\text{-CS}$) compared with that obtained in the presence of test cyclosporin ($IC_{50}\text{+CS}$) is taken as a measure of increased sensitivity of the CCL-R line to CTDS which has been induced by the cyclosporin. Stability of the CCL-R line used is ensured by cross checking its sensitivity to CTDS with that previously established.

In the above test model, cyclosporins of classes 1 to 3, in particular specific cyclosporins recited, are effective in increasing sensitivity to CTDS (c.g. DR, VC, AM etc.) at the above indicated concentrations in particular at concentrations of ca. 10 $\mu\text{g/ml}$, or less.

At higher concentrations, c.g. ca. 50 $\mu\text{g/ml}$ inhibition of proliferation of both CCL-S and CCL-R lines is, in particular instances, occasioned by test cyclosporins in the absence of CTDS, though where this occurs the phenomenon is generally less marked in CCL-R than CCL-S lines. More significantly, test cyclosporins are found to be effective in

increasing sensitivity to CTDS in CCL-R lines at concentrations which have no influence on cell proliferation in the absence of CTDS.

Thus in one series of trials employing an AM resistant human small lung cancer cell line, and cyclosporins 2.4, 1.1 and 1.32, established AM sensitisation ratios ($AM\ IC_{50}\text{-CS}/AM\ IC_{50}\text{+CS}$) are as follows*:

CYCLOSPORIN	SENSITISATION RATIO CYCLOSPORIN CONCENTRATION	
	50.0 $\mu\text{g/ml}$	5.0 $\mu\text{g/ml}$
2.4	>30	>30
1.1	-	>20
1.35	12	3.3
NONE	1.0	1.0

[*Investigation and data from P.R. Twentyman, MRC Clinical Oncology and Radiotherapeutic Unit, Hills road, Cambridge, England - c.f. Br. J. Cancer, 57, 254-258 (1988)]

EXAMPLE 2

Utility in restoring sensitivity to anti-neoplastic/cytotoxic, anti-tumor drug substances (in vitro-2).

Testing may be performed employing any appropriate drug resistant cell line and control (parental) cell line, generated, c.g. as described by Ling et al., J. Cell. Physiol. 83, 103-116 (1974) and Bech-Hansen et al. J. Cell. Physiol. 88, 23-32 (1976). Particular clones chosen are the multi-drug resistant (c.g. colchicine resistant) line CHR (subclone C5S3.2) and the parental, sensitive line AUX B1 (subclone AB1 S11)-c.f. Ling et al. loc. cit. and Juliano et al. Biochim. Biophys. Acta, 455, 152-162 (1976); Carlsen et al. Biochim. Biophys. Acta, 455, 900-912 (1976); Lalande et al., Proc. Natl. Acad. Sci., 78 (1), 363-367 (1981); Kartner et al., Science 221, 1285-1288 (1983); Kartner et al., Nature, 316, 820-823 (1985); Riordan et al., Nature, 316, 817-819 (1985); Van der Blick et al., Mol. Cell. Biol. 6, 1671-1678 (1986); Endicott et al., Mol. Cell Biol., 7, 4075-4081 (1987); Deuchars et al., Mol. Cell. Biol., 7, 718-724 (1987); and Gerlach et al., Nature, 324, 485-489 (1986).

Cell lines are grown in αMEM medium supplemented with (L)-asparagine 0.02 mg/ml, MEM vitamins (IX), penicillin-streptomycin 100 UT/ml, (L)-glutamine 2mM and 10% heat-inactivated fetal calf serum. Assay is performed using 96 well plates. 50 μl colchicine solution are added in the culture medium in triplicates to obtain final concentrations of 30-10-3-1-0.3-0.1-0 $\mu\text{g/ml}$ for the resistant line (RL) and of 0.3-0.1-0.03-0.01-0.003-0.001-0 $\mu\text{g/ml}$ for the sensitive line (SL). Further down-extension of the dose range is performed as necessary, i.e. when test cyclosporin very greatly decreases the IC_{50} response to colchicine.

Test cyclosporins are dissolved at 1 mg/ml in abs. $\text{C}_2\text{H}_5\text{OH}$. Each test cyclosporin is screened routinely at 0.1 and 1.0 $\mu\text{g/ml}$, with controls being treated with the corresponding $\text{C}_2\text{H}_5\text{OH}$ solvent dilutions. Test cyclosporin or control are added (50 μl) to each well and mixed with colchicine solutions already present. 100 μl cellular suspensions at 4×10^3 cells/ml for SL (400 cells/well) and 8×10^3 cells/ml for RL are added.

Proliferation is measured by colorimetric assay [Mosman, J. Immunol. Methods, 65, 55-63 (1983)] using 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyl tetrazolium bromide (MTT). First 100 μl cell-free supernatant is removed, then 10 μl MTT solution at 5 mg/ml in RPMI 1640 medium (Gibco) are added to each plate and the plate incubated for

3 hrs. at 37° C. 100 µl butanol/isopropanol/1N HCl (192:96:12 ml) are then added to each plate and the plates shaken until complete dissolution. Optical density (OD) is read at 540 nm.

Extent of cell growth (measured by MTT-dependent OD) is represented as a function of colchicine concentration, a dose-response curve being constructed for each test cyclosporin, and the colchicine IC₅₀ (CIC₅₀) (i.e. the concentration of colchicine required to reduce proliferation by 50%) determined.

Increase of colchicine sensitivity induced by each test cyclosporin at both 0.1 and 1.0 µg/ml is determined as:

$$\frac{\text{CIC}_{50} \text{ in absence of test cyclosporin}}{\text{CIC}_{50} \text{ in presence of test cyclosporin}} = \frac{\text{CIC}_{50-}}{\text{CIC}_{50+}} = \text{gain in sensitivity}$$

Test cyclosporins may influence colchicine sensitivity in both RL and SL. Relative influence in the two lines may be determined as:

$$\frac{\text{CIC}_{50+} \text{ for RL lines}}{\text{CIC}_{50+} \text{ for SL lines}} = \frac{\text{CIC}_{50+} \text{ RL}}{\text{CIC}_{50+} \text{ SL}} = \text{relative resistance}$$

Cyclosporins of classes 1 to 3 increase sensitivity of RL to colchicine at concentrations indicated above. Increase of sensitivity of SL is commonly observed at equivalent concentrations though is generally less than for RL. For use in accordance with the present invention, cyclosporins exhibiting higher relative resistance as defined above are generally considered more suitable. In one series of experiments the following gains in sensitivity to colchicine as defined above were, for example recorded for RL and SL.

CYCLO- SPORIN	SL		RL	
	0.1 µg/ml	1.0 µg/ml	0.1 µg/ml	1.0 µg/ml
1.1	4.0	8.0	1.4	30.8
1.2	4.4	8.1	2.0	59.8
1.3	5.3	10.7	1.8	97.9
1.4	6.7	11.7	1.7	97.6
1.10	3.6	11.6	1.1	28.9
1.11	6.3	17.6	1.1	36.7
1.15	4.7	12.9	1.5	38.3
1.37	5.8	12.1	1.4	82.4
2.2	7.9	15.1	1.5	97.3
2.4	4.7	15.7	1.2	34.5

EXAMPLE 3

Utility in restoring sensitivity to anti-neoplastic/cytotoxic, anti-tumor drug substances (in vivo)

Ehrlich ascites carcinoma (EA) sub-lines resistant to drug substance DR, VC, AM, ET, TE or CC are developed by sequential transfer of EA cells to subsequent generations of BALB/c host mice in accordance with the methods described by Slater et al., J. Clin. Invest, 70, 1131 (1982). For this purpose drug substance is administered at a dosage of 0.2 to 0.5 mg/kg, i.p. daily over 5 doses, starting 24 hours after inoculation of host mice with 0.2 ml undiluted malignant ascites harvested from pre-terminal animals.

For the test proper, host mice receive resistant EA-R or sensitive (parent) EA-S, EA lines as described above. Mice receiving EA-R are divided into groups receiving:

1. No drug/No cyclosporin
2. Drug-substance therapy/No cyclosporin

3. No drug/Test cyclosporin

4. Drug-substance+Test cyclosporin.

Anti-neoplastic drug substance is administered at dosages employed in generating EA-R lines. Cyclosporin test substance is administered at a total test dosage in the range of from 1 to 80 mg/kg, in particular 5 or 25 or up to 40 mg/kg in 5 divided daily doses, i.p. (in ethanol/olive oil) starting 24 hours after inoculation with EA-R. Mean-survival time in groups 2, 3 and 4 are compared with group 1 as measure of efficacy of applied therapy.

Results obtained show no significant difference in mean-survival time between groups 1, 2 and 3. In group 4, receiving cyclosporin of classes 1 to 3 at dosages as indicated above, substantial increase in survival time (e.g. of the order of 2 to 3 fold or greater) as compared with both groups 1 and 2 is observed.

Equivalent results may be obtained employing cyclosporins of classes 1 to 3 in test models of comparable design, e.g. in vitro, or employing test animals infected with drug-resistant viral strains, anti-biotic (e.g. penicillin) resistant bacterial strains, anti-mycotic resistant fungal strains as well as drug resistant protozoal strains, e.g. Plasmodial strains, for example naturally occurring sub-strains of Plasmodium falciparum exhibiting acquired chemotherapeutic, anti-malarial drug resistance.

Utility of cyclosporins of classes 1 to 3 in accordance with the present invention can also be demonstrated in clinical trials, for example preliminary trials, performed as follows:

CLINICAL TRIAL 1

Subjects (♂ and ♀) are selected from patients diagnosed as exhibiting malignant cancerous growth and to be submitted to anti-neoplastic/cytostatic drug therapy. A detailed report is submitted for each subject entered in the trial detailing case history, disease status, estimated rate of disease progression and estimated prognosis.

Type of anti-neoplastic/cytostatic drug therapy to be applied and estimated dosage rate required in the absence of cyclosporin therapy is determined by the attending physician, having regard to the type and extent of the cancer.

Trial cyclosporin is administered orally at a dosage rate of from 1.0 to 20.0 mg/kg/day or parenterally, e.g. i.v. or i.m., a dosage rate of from 0.5 to 5.0 mg/kg/day. Where disease status permits, treatment with trial cyclosporin commences at least 1 or 2 days, preferably 10 to 14 days before initiating anti-neoplastic therapy in order to permit build-up to ongoing therapeutic dosage levels. In such instances initiating cyclosporin dosages are at the lower end of the above indicated dosage ranges (e.g.: p.o., of the order of from 1.0 to 5.0 mg/kg/day; or parenterally, of the order of from 0.5 to 1.5 mg/kg/day) rising to higher dosage level (e.g. p.o., of the order of from 5.0 to 15.0 or up to 20.0 mg/kg/day or, parenterally, of the order of from 2.0 to 5.0 mg/kg/day), precise regimen being determined by the attending physician having regard to the subject's condition at trial entry. In some cases, it may be required that cyclosporin and anti-neoplastic/cytostatic therapy be initiated and terminated concomitantly, though again with preference for lower initiating cyclosporin dosaging, rising daily to the indicated maximum.

Initiating anti-neoplastic/cytostatic therapy is commenced at ca. 1/3 the estimated dosage rate required in the absence of cyclosporin therapy, precise choice of initiating dosage again being at the discretion of the attending physician. Anti-neoplastic/cytostatic dosaging is increased as required by observed response.

All relevant clinical parameters are monitored throughout the course of the trial, including cyclosporin and anti-neoplastic/cytostatic drug administration rates. Subjects are monitored for control/reduction in tumor growth/occurrence of metastases and possible tumor regression. Reports on disease status and estimated prognosis are submitted at intervals during the course of the trial.

Evaluation of trial results indicate that subjects entered exhibit effective control of or improvement of condition, with restriction of tumor growth or tumor regression and reduction of metastases at anti-neoplastic/cytostatic drug dosage rates below those estimated to be required for equivalent efficacy in the absence of cyclosporin therapy. Reduced incidence of anti-neoplastic/cytostatic drug resistance as compared with reports for groups receiving anti-neoplastic/cytostatic therapy only is recorded, as well as reduced incidence of adverse toxic reaction to administered anti-neoplastic/cytostatic therapy.

CLINICAL TRIAL II

Subjects are chosen from hospitalised or out-patient subjects (♂ and ♀) exhibiting late phase, malignant cancerous growth of whatever type. Subjects selected for trial are patients who have run a full course of anti-neoplastic/cytostatic drug therapy, and who are generally at a late phase of multiple drug treatment and exhibiting renewed onset of tumor growth/metastases etc., i.e. whose cancer is *prima facie* identifiable as multiple-drug resistant.

A detailed report is submitted for each subject entered in the trial detailing in particular drug therapy applied in the course of the previous 6 to 18 months to date, previous history and current disease status, e.g. estimated rate of disease progression and estimated prognosis.

For the purposes of the trial, entered subjects are maintained on predetermined dose and schedule of anti-neoplastic/cytostatic drug therapy, therapy chosen being that applied at identification of drug resistance and entry into the trial. Anti-neoplastic drug therapy is maintained throughout the trial at the preresistance-determination levels and schedule. The chemotherapy regimen is supplemented by administration of trial cyclosporin, in oral dosage form at a daily dosage rate of from ca. 1 to ca. 20, e.g. ca. 5 to ca. 15, mg/kg/day or administered parenterally, e.g. i.v., at a daily dosage rate of from ca. 0.5 to ca. 7.5, e.g. from ca. 2.0 to ca. 5.0, mg/kg/day. In some patients cyclosporin therapy may commence 1 to up to 14 days before initiating anti-neoplastic therapy and is continued during the entire treatment period. In other cases, it may be required that cyclosporin and anti-neoplastic therapy be initiated and terminated concomitantly.

Subjects are monitored for reduction in tumor growth/occurrence of metastases and possible tumor regression. Reports on disease status and estimated prognosis at the time of examination are submitted at intervals during the course of the trial. In the event that no improvement in condition or restriction of deterioration is reported within an appropriate period, basic anti-neoplastic/cytostatic drug therapy is varied at the discretion of the responsible clinician to alternative, previously applied therapy. All relevant clinical parameters are monitored throughout the course of the trial, including in particular anti-neoplastic/cytostatic drug and cyclosporin serum levels as well as clearance rates.

Evaluation of trial reports indicates that subjects entered exhibit marked improvement in condition, with restriction of tumor growth or tumor regression and decrease in

metastases following introduction of cyclosporin therapy, with on-going improvement in disease prognosis.

Cyclosporins of classes 1 to 3 are accordingly useful for the treatment of morbid conditions exhibiting acquired resistance to chemotherapeutic drug treatment, or as adjuvants to chemotherapeutic drug treatment.

The present invention accordingly provides:

- 1.1 A method of improving or increasing the efficacy of, or of increasing sensitivity to, chemotherapeutic drug therapy; or
- 1.2 A method of reducing effective chemotherapeutic drug dosage rate; in a subject in need thereof which method comprises co-administration of a cyclosporin of classes 1 to 3 as hereinbefore defined; or
- 2.1 A method of treating morbid conditions exhibiting or characterised by resistance, whether acquired, induced or inate, to chemotherapeutic treatment; or
- 2.2 A method of enhancing or improving chemotherapeutic treatment of morbid conditions exhibiting or characterised by resistance, whether acquired, induced or inate, to said treatment; or
- 2.3 A method of reversing or reducing resistance, whether acquired, induced or inate, to chemotherapeutic treatment; or
- 2.4 A method of restoring sensitivity to chemotherapeutic treatment; in a subject in need thereof, which method comprises administering to said subject an effective amount of a cyclosporin of any one of classes 1 to 3 as hereinbefore defined.

Alternatively the present invention provides:

3. A method of chemotherapeutic treatment in a subject in need thereof which comprises administering an appropriate chemotherapeutically active drug substance together with a cyclosporin of any one of classes 1 to 3 as hereinbefore defined as adjuvant treatment to said drug substance.

The present invention also provides:

4. A cyclosporin of any one of classes 1 to 3 as hereinbefore defined for use in a method as defined under any one of 1.1, 1.2, 2.1, 2.2, 2.3, 2.4 or 3 above; or
5. A cyclosporin of any one of classes 1 to 3 as hereinbefore defined for use in the preparation of a pharmaceutical composition for use in a method as defined under any one of 1.1, 1.2, 2.1, 2.2, 2.3, 2.4 or 3 above.

In that none of the cyclosporins of classes 1 to 3 has previously been proposed or recommended for pharmaceutical or therapeutic use, and in that particular cyclosporins of classes 1 to 3 are indeed novel compounds or cyclosporins of entirely novel type, the present invention also provides:

6. Cyclosporins of classes 1 to 3 as hereinbefore specified, e.g. including individual cyclosporins herein before indicated to be novel as well as cyclosporins of groups 1a², 1a³, 1a⁴, 1a⁵, 1d, 1e and of class 2(i) and 2(iii), for use as pharmaceuticals.

Particular conditions/forms of chemotherapeutic treatment to which the methods of the present invention apply include conditions caused by microbial, e.g. viral, bacterial, fungal or protozoal infection, involving strains resistant to one or more anti-microbial or antibiotic drug substances, e.g. anti-viral, anti-bacterial, anti-fungal or anti-protozoal drug substances.

The methods of the present invention are in particular applicable to the treatment of cancers, e.g. of carcinomas, sarcomas or other tumors or malignant growths, exhibiting

induced or acquired resistance to one or more anti-cancer chemotherapeutic drug substances, e.g. anti-neoplastic or cytostatic agents, e.g. anthracyclines or vinca alkaloid drug substances or the specific drug substances daunorubicin, vincristine, adriamycin, etoposide, tenoposide and/or colchicin, e.g. as a means of reducing or reversing tumor growth, occurrence of metastases etc.

Preferred cyclosporins for use in accordance with the present invention are those exhibiting relatively low immunosuppressive activity, e.g. having substantially no immunosuppressive activity at intended dosage levels or which exhibit immunosuppressive activity of an order which is substantially less, e.g. <50%, of that of Cyclosporin. Particular cyclosporins suitable for use in accordance with the methods of the present invention are cyclosporins hereinbefore specifically defined or recited under classes 1 to 3.

Dosages of cyclosporin to be employed in practicing the above methods will of course vary, e.g. depending on the condition to be treated (for example the disease type and the nature of resistance), the particular cyclosporin to be used, the effect desired and the mode of administration.

In general however satisfactory results are obtained on administration orally at dosages of the order from 1 to 20 or up to 50 mg/kg/day, e.g. of the order of from 5 to 10 or up to 15 mg/kg/day administered once or, in divided doses 2 to 4× per day, or on administration parenterally, e.g. intravenously, for example by i.v. drip or infusion, at dosages of the order of from 0.5 to 7.5 up to 10 mg/kg/day, e.g. of the order of from 1.5 or 2.0 up to 5.0 mg/kg/day.

Suitable daily dosages for patients are thus of the order of from 50 to 1,000 up to 2,500 mg p.o., e.g. of the order of from 250 to 500/600 mg p.o., or of the order of from 25.0 to 375.0 up to 500 mg i.v., e.g. of the order of from 75.0 to 100/250 mg i.v.

Alternatively and even preferably, dosaging may be arranged in patient specific manner to provide pre-determined trough blood levels, e.g. as determined by RIA technique. Thus patient dosaging may be adjusted so as to achieve regular on-going trough blood levels as measured by RIA of the order of from 50 or 150 up to 500 or 1000 ng/ml, i.e. analogously to methods of dosaging currently employed for regular Cyclosporin immunosuppressive therapy.

Pharmaceutical compositions suitable for oral administration of cyclosporins of classes 1 to 3 above when practicing the method of the present invention may, for example, be prepared as follows:

INGREDIENT	RELATIVE AMOUNT (g)
i) LABRAFIL M 1944 CS	150
ii) Cyclosporin (e.g. Cyclosporin 1.1, 1.2, 1.3, 1.11 or 1.36)	25 (dry weight value)
iii) Ethanol (absolute)	50
iv) Olive oil	ca. 237 to a
	total of ca. 462.0

All ingredients are weighed directly into a stirring vessel. Ingredients (i) and (iii) are weighed in first. Ingredient (ii) is then added with continuous stirring until dissolution. Ingredient (iv) is thereafter added with stirring for a further 10 mins. The obtained solution is filtered through a Gelman Preflow Filter (400 μm) at ca. 0.5 to 0.8 bar and filled into

50 ml Rexo bottles. The bottles are sealed with a rubber cork and cap. The entire procedure is carried out under water-free conditions at room temperature with nitrogen gassing (0.25 bar) at all stages. The bottled solution, which is suitable for oral administration, comprises 50 mg cyclosporin (dry weight)/ml. The solution may alternatively be filled into gelatin, e.g. hard or soft gelatin capsules as a means of taste masking. Cyclosporins of classes 4 and 6 and, in particular, individual cyclosporins of these classes hereinbefore specifically named, also exhibit pharmaceutical activity. In particular they exhibit immunosuppressive, anti-inflammatory and anti-parasitic activity as indicated in in vitro and in vivo tests, e.g. as described below. The said cyclosporins also possess activity with respect to experimental allergic encephalomyelitis (EAE) in the rat, again as described below.

EXAMPLE 4

Immunosuppressive activity:

- 4.1 Local haemolysis in vitro in gel [R. I. Mishell and R. W. Dutton, *J. Exp. Medicine*, 126, 423-442 (1976)]. Cyclosporins of classes 4 and 6 inhibit haemolysis zones compared with untreated controls at concentrations of from 0.03 to 10.0 μg/ml.
- 4.2 Lymphocyte stimulation test according to Janossy and Greaves [*Clin. Exp. Immunol.*, 9, 483 (1971) and 10, 525 (1972)]:—cyclosporins of classes 4 and 6 inhibit concanavalin A stimulated DNA-synthesis (inhibition of H³-thymidine incorporation), cell proliferation and blastogenesis in mouse-spleen lymphocytes compared with untreated controls at concentrations of from 0.001 to 3.0 μg/ml.
- 4.3 Mixed lymphocyte reaction [Bach et al., *J. Exp. Med.* 136, 1430 (1972)]:—the reaction (i.e. proliferation and differentiation) of lymphocytes (mouse (Balb/c) spleen cells) on co-incubation for 5 days, with allogenic spleen cells from irradiated mice (CBA) is measured in the presence and absence of test-substance. Reaction in the absence of test-substance serves as control and is taken as 100%. Reaction in the presence of test-substance is expressed as the % change compared with the 100% control reaction. Inhibition of reaction is observed using cyclosporins of classes 4 and 6 at a concentration of from 0.001 to 3.0 μg/ml.

EXAMPLE 5

Anti-inflammatory activity

Anti-inflammatory activity may be shown in the adjuvant arthritis test in the rat. For this test adjuvant arthritis is induced according to the method of Pearson and Wood, "Arthr. Rheum." 2, 440 (1959). Cyclosporins of classes 4 and 6 are active in this test against developing and established arthritis at doses of from 5 to 30 mg/kg/day p.o.

EXAMPLE 6

Anti-parasitic (anti-malarial) activity

Anti-malaria test according to L. Rane, "Chemotherapy and Drug Resistance in Malaria" ed. W. Peters, Academic Press, New York, 1970. Mice (OFl: male) are infected on day

0 with 0.2 ml of a suspension containing 10^7 parasitic cells of the species *Plasmodium berghei* (strain NK 65) administered i.p. Test substance is administered s.c. on day 3, at varying dosages using 5 to 10 mice/dose. The survival time recorded, and the minimum effective dosage (MED) calculated by comparison of survival time with that for untreated controls. For controls survival time=ca. 7 days. The MED is the dosage at which survival time is doubled. Cyclosporins of classes 4 and 6 are effective in this test at dosages of from 10 to 100 mg/kg/day.

EXAMPLE 7

Action on EAE in the rat

1. Action on established EAE

EAE is induced in groups of 8 to 12 otherwise healthy male rats weighing 150 to 200 g in accordance with the techniques described by Borel et al. Agents and Actions 6, 468, (1976). The rats are kept under laboratory conditions and are allowed access to food and water ad libitum. Onset of EAE is observed after 10 to 13 days and is marked by symptoms of paralysis, e.g. in the hind limbs. The test compound is administered to the test animals at a dosage of from 25 to 50 mg/kg p.o. each day for 5 consecutive days following EAE onset. The rats are examined daily for symptoms of the disease and the number of recovered rats as well as the day of recovery noted. Observation is continued for a further 5 to 8 weeks after commencement of treatment to detect any cases of relapse. Again the number of relapsed rats and the day of relapse is recorded.

On administration of cyclosporins of classes 4 and 6 in the dosage range indicated above, a decreased recovery time is noted compared with control groups receiving placebo (olive oil) only.

7.2 Action in preventing the occurrence of EAE

The test is conducted analogously to that described under 4.1 above. In this case, however, the test compound is administered at a dosage of from 25 to 50 mg/kg p.o. each day, starting at the day of sensitisation (induction of EAE) for 14 days. The rats are observed daily for symptoms of paralysis, and the day of onset of EAE in afflicted individuals noted. Observation is continued over a period of months to detect possible delayed onset of EAE.

On administration of Cyclosporins of classes 4 and 6 in the dosage range indicated above prevention of onset of EAE, over the observation period, is observed compared with controls treated with placebo (olive oil) only.

In view of their immunosuppressive activity cyclosporins of classes 4 and 6 are useful for the prophylaxis and treatment of diseases and conditions requiring reduction of the immune response. Thus they may be used to suppress the proliferation of lymphocytes and immunocytes, e.g. in the treatment of auto-immune diseases or in preventing the rejection of organ transplants, e.g. heart, heart-lung, skin, corneal, bone-marrow, pancreatic and kidney transplants.

In view of their anti-inflammatory activity and activity with respect to EAE, cyclosporins of classes 4 and 6 are also useful for the treatment of inflammatory conditions, in particular inflammatory conditions with an aetiology including an autoimmune component, e.g. for the treatment of arthritis (for example rheumatoid arthritis, arthritis chronica

progredivente and arthritis deformans) and rheumatic diseases, as well as autoimmune hematological disorder (including e.g. hemolytic anaemia, aplastic anaemia, pure red cell anaemia and idiopathic thrombocytopaenia), systemic lupus erythematosus, polychondritis, scleroderma, Wegener granulomatosis, dermatomyositis, chronic active hepatitis, myasthenia gravis psoriasis, Steven-Johnson syndrome, idiopathic sprue, autoimmune inflammatory bowel disease (including e.g. ulcerative colitis and Crohn's disease) endocrine ophthalmopathy, Grave's disease, sarcoidosis, primary billiary cirrhosis, primary juvenile diabetes (diabetes mellitus type I), uveitis (anterior and posterior), interstitial lung fibrosis, psoriatic arthritis, glomerulonephritis (with and without nephrotic syndrome, e.g. including idiopathic nephrotic syndrome or minimal change nephropathy), and multiple sclerosis.

In view of their anti-parasitic activity, cyclosporins of classes 4 and 6 are also useful for the treatment of parasitic infection. For example coccidiomycosis and schistosomiasis, and, in particular, protozoal infection, especially malaria.

For the above mentioned uses the dose will, of course, vary depending on the cyclosporin chosen, the mode of administration, the particular condition to be treated and the therapy desired. In general, however, satisfactory results are obtained on administration at an oral daily dosage from about 1 to 100, preferably from about 5 to 50, most preferably 10 to 20 mg/kg animal body weight. For the larger mammals e.g. humans, the total daily dosage is in the range of from about 75 to about 2000, preferably from about 200 to about 1000, most preferably from about 300 to about 700 mg. Dosage forms suitable for oral administration comprise from about 20 to about 2000, preferably from about 50 to about 1000, most preferably about 75 to 700 mg cyclosporin admixed with a solid or liquid pharmaceutical diluent or carrier, conveniently administered once or in divided dosages 2 to 4x/day.

As indicated above suitable daily dosage rates will depend, inter al, on the particular cyclosporin chosen, e.g. having regard to its relative potency of action. For preferred cyclosporins of classes 4 and 6 results IC_{50} values ($\mu\text{g/ml}$) obtained in one series of experiments in accordance with examples 4 above are as follows:

CYCLOSPORIN	METHOD OF EXAMPLE		
	4.1	4.2	4.3
4.8	0.1	0.16	0.09
6.4	0.03	<0.008	<0.008
6.15	0.057	<0.008	<0.008

The preferred cyclosporin for use in anti-parasitic indications is cyclosporin 4.7. An ED_{50} value obtained for this cyclosporin in the method of example 6 is: ca. 15.0 mg/kg.

In accordance with the foregoing the present invention also provides:

- A pharmaceutical composition comprising a cyclosporin of class 4 or 6 as hereinbefore defined, together with a pharmaceutically acceptable diluent or carrier therefor;
- A method of inducing immunosuppression, for the treatment of inflammatory diseases or conditions or for

the treatment of parasitic infection, in a subject in need of such treatment which method comprises administering to said subject an effective amount of a cyclosporin of class 4 or 6 as hereinbefore defined; as well as

9. A cyclosporin of class 4 or 6 for use as a pharmaceutical, e.g. for use as an immunosuppressant, as an anti-inflammatory agent or as an anti-parasitic agent.

Particular immunosuppressive, anti-inflammatory and anti-parasitic uses to which the cyclosporins of classes 4 and 6 can be put, include any of those hereinbefore described, e.g. including any of the particular forms of organ transplant, inflammatory disease, autoimmune disease, or parasitic infection listed above.

We claim:

1. A cyclosporin of the formula

where A is a residue of the formula

B is $-\alpha$ -Abu-, -Thr-, -Val-, -Nva-, or a residue of the formula

where R_3 is C_{1-4} alkyl.

2. The compound according to claim 1, which is [3'-desoxy-3'-oxo-MeBmt]¹-Ciclosporin.

3. The compound according to claim 1, which is [3'-desoxy-3'-oxo-MeBmt]¹-[Val]²-Ciclosporin.

4. The compound according to claim 1, which is [3'-desoxy-3'-oxo-MeBmt]¹-[Nva]²-Ciclosporin.

5. A pharmaceutical composition comprising a therapeutically effective amount of a cyclosporin according to claim 1 and a pharmaceutically acceptable carrier therefor.
