**PHARMACEUTICALLY ACTIVE  
BENZOQUINAZOLINE COMPOUNDS**

This is a divisional of copending Ser. No. 07/956,018 filed Jan. 13, 1993, which is a 371 of PCT/GB91/00977 filed Jun. 18, 1991.

The present invention relates to novel benzoquinazoline thymidylate synthase inhibitors, to processes for preparing them and pharmaceutical formulations containing them.

U.S. Pat. No. 4,814,335 discloses inter alia that compounds of the formula (0):

wherein R is hydrogen, fluoro, nitro, optionally substituted amino, carboxy, azido, alkoxy, trimethylsulphonyl, trifluoromethylsulphonyl or alkoxycarbonyl have biological response-modifying activity, i.e. antiviral, antibacterial and anticancer activity. However, no specific examples of compounds of the formula (0) are provided.

Thymidylate synthase is an enzyme catalysing the terminal step in the de novo synthesis of thymidylate required for DNA synthesis. It has been postulated that inhibitors of this enzyme may be expected to have anti-tumour activity and it has been reported (Jones et al, J. Med. Chem. 1986, 29, 468) that the in-vivo antitumour activity of N<sup>10</sup>-propargyl-5,8-dideazafolic acid arises solely from its inhibitory effect on this enzyme.

It has now been found that a group of benzoquinazoline compounds are inhibitors of the enzyme thymidylate synthase and have antitumour activity.

Accordingly, the present invention provides compounds of the formula (I)

Certain compounds of the formula (I) contain asymmetric carbon atoms and are, therefore, capable of existing as optical isomers. The individual isomers and mixtures of these are included within the scope of the present invention.

Salts of the compounds of the present invention may comprise acid addition salts derived from an amino group or anionic species derived from a compound of formula (I), for example when this is substituted by a carboxy group, and a cation. In both types of salts, the therapeutic activity resides in the moiety derived from the compound of the invention as defined herein and the identity of the other component is of less importance although for therapeutic and prophylactic purposes it is, preferably, pharmaceutically acceptable to the patient. Examples of pharmaceutically acceptable acid addition salts include those derived from mineral acids, such as hydrochloric, hydrobromic, phosphoric, metaphosphoric, nitric and sulphuric acids, and organic acids, such as tartaric, acetic, trifluoroacetic, citric, malic, lactic, fumaric, benzoic, glycollic, gluconic, succinic and methanesulphonic and arylsulphonic, for example p-toluenesulphonic, acids.

Examples of salts comprising an anionic species derived from a compound of formula (I) and a cation include ammonium salts, alkali metal salts, such as sodium and potassium salts, alkaline earth salts, such as magnesium and calcium salts, and salts formed with organic bases, for example, amino salts derived from mono-, di- or tri-(lower alkyl) or (lower alkanol)amines, such as triethanolamine and diethylamino-ethylamine, and salts with heterocyclic amines such as piperidine, pyridine, piperazine and morpholine. The pharmaceutically acceptable salts together with the salts which are not thus acceptable have utility in the isolation and/or the purification of the compounds of the invention, and the pharmaceutically unacceptable salts are also useful in being convertible to the pharmaceutically acceptable salts by techniques well known in the art.

Esters of compounds of the formula (I), formed from compounds of the formula (I) which contain a carboxy group are often useful intermediates in the preparation of the parent acid.

The present invention also provides a process for the preparation of compounds of the formula (I) which comprises a method well known to those skilled in the art, for example:

(i) when it is required to prepare a compound of the formula (I) wherein the dotted line represents a single bond, the reaction of a compound of the formula (V)

(V)

wherein R<sup>2</sup> to R<sup>5</sup> are as hereinbefore defined and R<sup>36</sup> is a C<sub>1-4</sub> alkyl group, with a compound

wherein  $\text{R}^1$  is as hereinbefore defined. This reaction is suitably carried out in a polar solvent, for example a  $\text{C}_{1-4}$  alkanol or glycol, conveniently methanol or ethanol, normally in the presence of a base, for example a metal alkoxide conveniently formed from the metal and the solvent, i.e. sodium methoxide or ethoxide, at an elevated temperature, for example  $50^\circ$  to  $150^\circ$  C. and conveniently  $60^\circ$  to  $90^\circ$  C. The compound of the formula

is conveniently liberated in situ from a salt form, for example the hydrochloride or carbonate salt, by the base which is preferably present in the reaction mixture. This reaction is a preferred method for preparing those compounds of the formula (I) wherein one of  $\text{R}^2$  to  $\text{R}^5$  is not a group  $\text{XYR}^{16}$ .

(ii) the direct insertion of a substituent  $\text{R}^2$ ,  $\text{R}^3$ ,  $\text{R}^4$  or  $\text{R}^5$  into the aromatic ring system. This is particularly suitable for the insertion of halo or nitro substituents or a group  $\text{SO}_2$  hal. This is carried out by methods conventionally employed to insert these substituents on aromatic ring systems, for example in the case of a bromo substituent: reaction of the corresponding compound where  $\text{R}^2$  to  $\text{R}^7$  are all hydrogen with bromine in a suitable solvent such as glacial acetic acid at a temperature between  $20^\circ$  and  $100^\circ$  C., conveniently between  $50^\circ$  and  $70^\circ$  C.; in the case of a substituent  $\text{SO}_2$  hal: reaction of the corresponding compound where  $\text{R}^2$  to  $\text{R}^7$  are all hydrogen with a halosulphonic acid at a temperature between  $-5^\circ$  and  $100^\circ$  C., conveniently between  $20^\circ$  and  $30^\circ$  C.; in the case of a nitro substituent: reaction of the corresponding compound where  $\text{R}^2$  to  $\text{R}^7$  are hydrogen with nitric acid potassium nitrate in sulphuric acid at  $-30^\circ$  to  $50^\circ$  C. and conveniently at  $-5^\circ$  to  $5^\circ$  C. The position of attachment of the substituent to the aromatic ring system may be effected by, inter alia, the nature of the substituent  $\text{R}^1$ . Thus, when  $\text{R}^1$  is an amino group an  $\text{SO}_2$  group will be attached to the 8-position but when  $\text{R}^1$  is a methyl group an  $\text{SO}_2$  group will be attached to the 9-position.

(iii) the hydrolysis of a compound of the formula (VI)

wherein  $\text{R}^1$  to  $\text{R}^7$  are as hereinbefore defined. This hydrolysis is conveniently carried out by acid, for example a mineral acid such as hydrochloric acid, at a temperature of between  $20^\circ$  and  $120^\circ$  C. and conveniently at between  $60^\circ$  and  $100^\circ$  C.

(iv) the conversion of one compound of the formula (I) to a further compound of the formula (I), for example:

(a) the dehydrogenation of a compound of the formula (VII):

wherein  $\text{R}^1$  to  $\text{R}^7$  are as hereinbefore defined and  $\text{R}^{37}$  is  $\text{C}_{1-4}$  alkyl or a primary, secondary or tertiary amino group within the definition of  $\text{R}^1$  or when it is desired to prepare a compound of the formula (I) wherein  $\text{R}^1$  is a primary amino or a hydroxy group  $\text{R}^{37}$  is a protected amino or hydroxy group; and thereafter removing the protecting group where appropriate. This dehydrogenation is conveniently carried out by (i) bromination of the 5- or 6-position of the compound of the formula (VII) by a reagent such as N-bromosuccinimide followed by dehydrobromination (ii) catalytic dehydrogenation in inert solvent (e.g. diglyme), (iii) dehydrogenation with DDQ. Reaction (i) is conveniently carried out in the presence of a base, such as pyridine, in an inert solvent, for example benzene, at a non-extreme temperature, for example between  $0^\circ$  and  $80^\circ$  C. The pivaloyl group is a suitable protecting group when  $\text{R}^1$  is  $\text{NH}_2$ .

The compounds of the formula (VII) are conveniently prepared from the corresponding compounds of the formula (V) as described in method (i) above.

(b) when it is desired to prepare a compound of the formula (I) wherein one of  $\text{R}^2$  to  $\text{R}^5$  is a group  $\text{S(O)}_m\text{YR}^{16}$  wherein Y and  $\text{R}^{16}$  are as hereinbefore defined, the reaction of the analogous precursor substituted by the group  $\text{SO}_2$ hal with a compound  $\text{HYR}^{16}$  wherein hal is halo and  $\text{R}^{16}$  is hereinbefore defined. Suitably this reaction is carried out in a basic medium, for example pyridine, at an elevated temperature, i.e.  $25^\circ$  to  $175^\circ$  C. The precursor is prepared by analogy to method (ii) above whereby a compound of formula (I) or (II), wherein at least one of  $\text{R}^2$ - $\text{R}^5$  is H in the position desired for substitution, is reacted with chlorosulfonic acid at  $-5^\circ$  to  $100^\circ$  C.

(c) when it is desired to prepare a compound of the formula (I) substituted by an amino group the reduction of the corresponding compound substituted by a nitro group. Reduction is suitably carried out by hydrogenation in the presence of a transition metal catalyst for example palladium on charcoal in an inert solvent, for example alkanol, such as ethanol, at a non-extreme temperature, for example ( $25^\circ$  to  $35^\circ$  C.).

(d) when it is desired to prepare a compound of the formula (I) substituted by a hydroxy group, the removal of an alkyl group from the corresponding alkoxy compound. This reaction is conveniently carried out in the presence of a strong acid, such as hydrobromic acid at a non-extreme temperature.

(e) when there is more than one substituent  $\text{R}^2$  to  $\text{R}^5$ , removal of one of the substituents, for example removal of bromine by catalytic debromination, such as hydrogenation in the presence of a transition metal catalyst, conveniently palladium on charcoal, in a polar solvent such as a  $\text{C}_{1-4}$  alkanol at between  $0^\circ$  and  $50^\circ$  C. conveniently  $20^\circ$  to  $30^\circ$  C.

(f) when one of  $R^2$  to  $R^5$  is an alkyl group, the halogenation of this alkyl group, for example bromination by N-bromosuccinimide in an inert solvent, such as benzene, at a temperature between 20° and 120° C., conveniently 70° to 90° C.

(g) the displacement of a leaving group from a substituent  $R^2$  to  $R^5$  by another group, for example conversion of a haloalkyl group to an hydroxyalkyl or alkoxyalkyl group by reaction with an alkali metal hydroxide or alkoxide respectively in alkanol, at a temperature between 20° and 120° C.; or conversion of a group  $CH_2$  hal wherein hal is halo to a group  $CH_2YR^{16}$  by reaction with a compound  $HYR^{16}$  wherein Y and  $R^{16}$  are as hereinbefore defined, for example N-(4-aminobenzoyl)-L-glutamic acid diethyl ester, ethyl N-(4-amino-2-fluorobenzoyl) glycinate or 4-fluoroanilino, in a dipolar aprotic solvent, such as dimethylformamide, at a non-extreme temperature, for example 25° to 160° C. and conveniently 95° to 105° C. optionally followed by the addition of a weak base such as sodium or potassium carbonate or bicarbonate.

(h) the replacement of one substituent  $R^2$  to  $R^5$  by another substituent  $R^2$  to  $R^5$  for example displacement of bromo by an alkynyl moiety which is preferably protected by a trialkylsilyl group in the presence of a suitable catalyst, such as palladium acetate. The trialkylsilyl group may then be removed by base catalysed hydrolysis, for example with potassium carbonate. The alkynyl group can be reduced, by catalytic hydrogenation, to an alkenyl or alkyl group.

When  $R^1$  is an amino group, it is often convenient to carry out these conversions with the amino group protected, for example with a pivaloyl group.

The compounds of the formula (V) may be prepared by the reaction of a dialkyl carbonate with a compound of the formula (VIII)

(VIII)

wherein  $R^2$  to  $R^5$  are as hereinbefore defined in the presence of a base, conveniently sodium hydride. This reaction is analogous to that described by J. Vebrel and R. Carrie (Bull. Soc. Chim. Fr., 1982, 161).

The compounds of the formula (VI) wherein  $R^1=NH_2$  may be prepared by the reaction of dicyandiamide with a compound of the formula (VIII). This reaction is described by Rosowsky et al (J. Heterocyclic Chem. 9, 263 (1972)).

The compounds of the formula (VIII) may be prepared by methods well known to those skilled in the art, for example by methods analogous to those described by J. Vebrel and R. Carrie (Bull. Soc. Chim. Fr., 1982, 161) and J. H. Burkhalter and J. R. Campbell (J. Org. Chem., 26, 4332 (1961) and those outlined in Schemes 1, 2 and 3 appended hereto.

The present invention also relates to novel chemical intermediates of the formula (VI). Compounds of the formula (VI) possess pharmacological properties and may therefore be useful in their own right as well as being useful intermediates in the preparation of compounds of the formula (I).

Whilst it is possible for the compounds or salts of the present invention to be administered as the raw chemical, it

is preferred to present them in the form of a pharmaceutical formulation. Accordingly, the present invention further provides a pharmaceutical formulation, for medicinal application, which comprises a compound of the present invention or a pharmaceutically acceptable salt thereof, as hereinbefore defined, and a pharmaceutically acceptable carrier therefor.

The pharmaceutical formulation may optionally contain other therapeutic agents that may usefully be employed in conjunction with the compound or salt of the present invention, for example a pyrimidine nucleoside transport inhibitor that is capable of enhancing the antineoplastic activity of the compounds and salts of the present invention. The expression "pharmaceutically acceptable" as used herein in relation to the carrier is used in the sense of being compatible with the compound or salt of the invention employed in the formulation and with any other therapeutic agent that may be present, and not being detrimental to the recipient thereof. The carrier itself may constitute one or more excipients conventionally used the art of pharmacy that enable the compound or salt of the present invention and any other therapeutic agent that may be present, to be formulated as a pharmaceutical formulation.

The pharmaceutical formulations of the present invention include those suitable for oral, parenteral (including subcutaneous, intradermal, intramuscular and intravenous) and rectal administration although the most suitable route will probably depend upon, for example, the condition and identity of the recipient. The formulations may conveniently be presented in unit dosage form and may be prepared by any of the methods well known in the art of pharmacy. All methods include the step of bringing into association the active ingredient, i.e., the compound or salt of the present invention, with the carrier. In general, the formulations are prepared by uniformly and intimately bringing into association the active ingredient with a liquid carrier or, a finely divided solid carrier or both, and then, if necessary, forming the associated mixture into the desired formulation.

The pharmaceutical formulations of the present invention suitable for oral administration may be presented as discrete units, such as a capsule, cachet, tablet, or lozenge, each containing a predetermined amount of the active ingredient; as a powder or granules; as a solution or a suspension in an aqueous liquid or a non-aqueous liquid such as a syrup, elixir or a draught, or as an oil-in-water liquid emulsion or a water-in-oil liquid emulsion. The formulation may also be a bolus, electuary or paste.

Generally, a tablet is the most convenient pharmaceutical formulation suitable for oral administration. A tablet may be made by compressing or moulding the active ingredient with the pharmaceutically acceptable carrier. Compressed tablets may be prepared by compressing in a suitable machine the active ingredient in a free-flowing form, such as a powder or granules, in admixture with, for example, a binding agent, an inert diluent, a lubricating agent, a disintegrating agent and/or a surface active agent. Moulded tablets may be prepared by moulding in a suitable machine a mixture of the powdered active ingredient moistened with an inert liquid diluent. The tablets may optionally be coated or scored and may be formulated so as to provide slow or controlled release of the active ingredient.

The pharmaceutical formulations of the present invention suitable for parenteral administration include aqueous and non-aqueous sterile injection solutions which may contain, for example, an anti-oxidant, a buffer, a bacteriostat and a solution which renders the composition isotonic with the blood of the recipient, and aqueous and non-aqueous sterile suspensions which may contain, for example, a suspending

agent and a thickening agent. The formulations may be presented in uni-dose or multi-dose containers, for example sealed ampoules and vials, and may be stored in a freeze-dried (lyophilized) condition requiring only the addition of the sterile liquid carrier, for example water for injection, immediately prior to use. Extemporaneous injection solutions and suspensions may be prepared from sterile powders, granules and tablets of the kind previously described.

The pharmaceutical formulations of the present invention suitable for rectal administration may be presented as a suppository containing, for example, cocoa butter and polyethylene glycol.

As mentioned hereinbefore, compounds and salts of formula (I) have anti-neoplastic activity as demonstrated hereinafter in the human colon SW480 adenocarcinoma cell culture cytotoxicity tests in which representative compounds of the present invention have been shown to be active. Compounds and salts of formula (I) also have anti-neoplastic activity as determined hereinafter in the human breast MCF7 adenocarcinoma cell culture cytotoxicity tests. It has thus been established that compounds of the present invention are able to inhibit neoplastic growth. Therefore, compounds and salts of the present invention are of use in medicine and in particular in the treatment of neoplastic growth, including solid tumours such as melanoma, breast and colon tumours in mammals. Accordingly, the present invention yet further provides a method for the treatment of susceptible malignant tumours and leukemia in an animal, e.g., a mammal, which comprises administering to the animal a therapeutically effective amount of a compound or salt of the present invention. In the alternative, there is also provided a compound or salt of the present invention for use in medicine and in particular for use in the treatment of a neoplastic growth, e.g., malignant tumours.

The present invention also provides the use of a compound of formula (I) or a salt thereof for the manufacture of a medicament for the treatment of neoplastic growth.

The animal requiring treatment with a compound or salt of the present invention is usually a mammal, such as a human being.

Particular examples of a neoplastic growth requiring treatment include malignant tumours.

Compounds and salts of the formula (I) also inhibit the enzyme Thymidylate Synthase from *E. coli* and *Candida albicans*. Therefore, compounds and salts of the present invention may be of use in the treatment of bacterial and fungal infections in mammals.

The route by which the compound or salt of the present invention is administered to the animal may be oral, topical, parenteral (including subcutaneous, intradermal, intramuscular, intravenous or rectal). If the compound or salt is presented in the form of a pharmaceutical formulation, which, as mentioned hereinbefore, is preferred, then the actual formulation employed will of course depend on the route of administration elected by the physician or veterinarian. For example, if oral administration is preferred, then the pharmaceutical formulation employed is, preferably, one which is suitable for such a route.

A therapeutically effective amount of a compound or salt of the present invention will depend upon a number of factors including, for example, the age and weight of the animal, the precise condition requiring treatment and its severity, the nature of the formulation, and the route of administration, and will ultimately be at the discretion of the attendant physician or veterinarian. However, an effective amount of a compound of the present invention for the treatment of neoplastic growth, for example colon or breast

carcinoma will generally be in the range of 0.1 to 100 mg/kg body weight of recipient (mammal) per day and more usually in the range of 1 to 10 mg/kg body weight per day. Thus, for a 70 kg adult mammal, the actual amount per day would usually be from 70 to 700 mg and this amount may be given in a single dose per day or more usually in a number (such as two, three, four, five or six) of sub-doses per day such that the total daily dose is the same. An effective amount of a salt of the present invention may be determined as a proportion of the effective amount of the compound per se.

An effective amount of a compound of the present invention for the treatment of disorders of the immune system (e.g. rheumatoid arthritis and tissue rejection) and related diseases such as psoriasis, will generally be in the range of 0.07–10 mg/kg body weight of recipient (mammal) per day. Thus for a 70 kg adult human, the actual amount per day would usually be from about 5–700 mg per day and this amount may be given in a single dose per day, or more usually dosing would be intermittent e.g. at 12 hourly intervals or weekly. An effective amount of a salt of the present invention may be determined as a proportion of the effective amount of the compound per se.

The treatment of neoplastic growth with a compound of the present invention may at times require the administration to the animal of an antidote or rescue agent, e.g. thymidine.

The following examples illustrate the preparation of compounds of the present invention, their pharmacological properties and formulations containing them.

#### EXAMPLE A

Alkyl 3,4-dihydro-2-hydroxy-1-naphthoates were prepared by reaction of sodium enolates of the starting 2-tetralones with dimethyl or diethyl carbonate in the presence or absence of a co-solvent such as toluene. For example,

##### Methyl 7-Bromo-3,4-dihydro-2-hydroxy-1-naphthoate

To a refluxing stirred suspension of sodium hydride (5.6 g of 80% in oil, 187 mmoles) in dry dimethyl carbonate (120 ml) under a nitrogen atmosphere was added a solution of 7-bromo-2-tetralone (14 g, 61 mmoles) in dry dimethyl carbonate (60 ml) dropwise over 40 minutes. Refluxing was continued for an additional 45 minutes and then cooled to room temperature. The reaction was carefully quenched with glacial acetic acid, diluted with one volume of water and extracted with ethyl acetate (150 ml). The organic phase was dried over magnesium sulfate, filtered and evaporated under reduced pressure to leave a residue which was purified using silica gel column chromatography eluting with ethyl acetate:hexane (39:7) to give methyl 7-bromo-3,4-dihydro-2-hydroxy-1-naphthoate as a white solid. (15.2 g, 86%).

The following 3,4-dihydro-2-hydroxy-1-naphthoates were prepared using the procedure described above without significant modification: methyl, ethyl 4-methyl, methyl 5-fluoro, ethyl 5-chloro, methyl 5-bromo, ethyl 5-iodo, ethyl -5-methyl-0 ethyl 5-phenyl-, ethyl 6-fluoro-, ethyl 6-chloro-, ethyl 6-bromo-, ethyl 7-fluoro, ethyl 7-chloro, ethyl 7-bromo-, ethyl 7-iodo-, ethyl -7-methyl-, ethyl 7-phenyl-, methyl 7-ethoxy-, methyl 7-methylthio-, methyl 7-ethylthio-, ethyl 8-chloro-, ethyl -4,4-dimethyl-, ethyl -5,7-dimethyl-, ethyl 6,7-dichloro-, ethyl 6,7-dimethoxy-, ethyl 6-chloro-4-methyl-, and ethyl 7-chloro-3,4-dihydro-2-hydroxy-4-methyl-1-naphthoate.

The following 2-tetralones were obtained from commercial suppliers 2-tetralone; 5-methoxy-2-tetralone;

6-methoxy-2-tetralone; 7-methoxy-2-tetralone; and 6,7-dimethoxy-2-tetralone.

Other 2-tetralones were obtained by one or two methods A) from the corresponding 1-tetralones by a four-step carbonyl transposition sequence <sup>1</sup>, or B) from appropriately substituted phenylacetic acids by cyclization of the corresponding acid chlorides with ethylene or propylene under Friedel-Crafts conditions <sup>2</sup>. #### Method A

##### 4,4-Dimethyl-2-tetralone

To a stirred suspension of sodium borohydride (3.5 g, 93 mmoles) in dry methanol (50 ml) at 0° C. under a nitrogen atmosphere was added a solution of 4,4-dimethyl-1-tetralone (10 g, 57.4 mmoles) in dry methanol:toluene (1:3) dropwise over a 45 minute period. After this time the mixture was allowed to warm to room temperature, and then two volumes of water were added. After stirring for 1 hour, the organic layer was separated, dried over magnesium sulfate, filtered, and evaporated under reduced pressure to leave a light yellow oil. This was purified by silica gel column chromatography eluting with ethyl acetate:hexane (1:9) to give 1,2,3,4-tetrahydro-4,4-dimethyl-1-naphthol as a colorless oil. (9.89 g, 98%).

A mixture of 1,2,3,4-tetrahydro-4,4-dimethyl-1-naphthol (9.6 g, 54.5 mmoles) in 20% aqueous oxalic acid was stirred and heated to reflux for 5 hours. After cooling, the reaction mixture was diluted with one volume of water and then extracted with one volume of ether. The aqueous layer was extracted again with one volume of ethyl acetate and the combined organic phases were dried over magnesium sulfate, filtered, and evaporated under reduced pressure to leave an oil which was purified using silica gel column chromatography, eluting with ethyl acetate:hexane (0.1:49.9) to give 1,2-dihydro-1,1-dimethylnaphthalene as a colorless oil. (4.76 g, 55%).

To a stirred mixture of 30% hydrogen peroxide (5 ml) and 97% formic acid (20 ml) in a round bottom flask equipped with an additional funnel, thermometer, and an ice water bath was added 1,2-dihydro-1,1-dimethylnaphthalene (4.5 g, 28 mmoles) dropwise at 5° C. under a nitrogen atmosphere. When the addition was complete, the reaction vessel was raised above the cooling bath to allow the reaction temperature to rise to just below 35° C. at which point the flask was immersed again. In this manner the temperature of the reaction was maintained between 30° and 35° C. for 45 minutes. After this time the exothermic phase of the reaction ended and the mixture was allowed to cool to room temperature. A solution of 10% aqueous ferric sulfate was added in portions of a few milliliters each until cloudiness persisted in the stirred mixture and then all solvent was removed under reduced pressure. The viscous brown residue was refluxed with 20% H<sub>2</sub>SO<sub>4</sub> (20 ml) for 4 hours and then cooled, extracted three times with ether (75 ml each), dried over magnesium sulfate, filtered and evaporated to leave a brown oil. This was purified using silica gel column chromatography eluting with ethyl acetate:hexane (7:93) to give 4,4-dimethyl-2-tetralone. (3.4 g, 74%). Overall yield=40%.

Using method A, 4-methyl-2-tetralone and 5,7-dimethyl-2-tetralone were also prepared.

#### Method B

##### 6-Bromo-2-tetralone

A mixture of oxalyl chloride (100 g) and 4-bromophenylacetic acid<sup>3</sup> (25 g, 11.6 mmoles) was stirred

under a nitrogen atmosphere at room temperature for 2 hours and then refluxed for 4 hours more. After cooling, the excess oxalyl chloride was removed by evaporation under reduced pressure to give crude 4-bromophenylacetyl chloride as a light yellow oil which was not purified further.

3-substituted phenylacetic acids led to mixtures of 5- and 7-substituted 2-tetralones which were separable by silica gel column chromatography or recrystallization from ether:hexane or ethyl acetate:hexane solvent mixtures.

To a two-liter round bottom flask equipped with a gas inlet tube connected to an external tank of ethylene, an addition funnel containing a solution of the crude 4-bromophenylacetyl chloride described above in methylene chloride (75 ml), a thermometer, a gas inlet adapter connected to a bubbler and a positive nitrogen flow, and a heavy-duty magnetic stirrer was added dry methylene chloride (1000 ml) and aluminium chloride (56 g, 0.42mole). The stirred suspension was cooled to -10° C. using an ice/salt bath, and ethylene was introduced through the gas inlet tube, which was positioned just above the vortex. Dropwise addition of the phenylacetyl chloride solution was started at a moderate rate, and adjusted periodically that the reaction temperature stayed below 0° C. Ethylene flow was continued for 30 minutes after addition of the acid chloride solution was complete, and then reaction mixture was poured over 2000 ml of ice, stirred vigorously for a few minutes, and left to sit until the ice melted. The methylene chloride layer was separated and the aqueous layer was extracted three times with methylene chloride (100 ml each). Combined methylene chloride layers were filtered through a short silica gel plug and then evaporated under reduced pressure to leave an amber-colored oil, which was purified using silica gel column chromatography, eluting with ethyl acetate:hexane (35:65) to give 6-bromo-2-tetralone as an amber crystalline solid. (25 g, 95%).

The following 2-tetralones were also prepared using method B 5-fluoro-, 5-chloro-, 5-bromo-, 5-iodo-, 5-methyl-, 5-phenyl-, 6-fluoro-, 6-chloro-, 7-fluoro-, 7-chloro-, 7-bromo-, 7-iodo-, 7-methyl-, 7-phenyl-, 7-ethoxy-, 7-methylthio-, 7-ethylthio-, 8-chloro-, 6,7-dichloro-, 6-chloro-4-methyl-, and 7-chloro-4-methyl-2-tetralone.

The phenylacetic acids required for the syntheses of the 2-tetralones were generally commercially available. The following exceptions (3-ethoxy-, 3-ethylthio-, 3-methylthio- and 3-phenylphenylacetic acids) were synthesized as indicated below.

A solution of potassium ethanethiolate was prepared by adding ethanethiol (202 ml, 2.73 mole) dropwise over 10 minutes to a solution of 87.5% KOH (159 g, 2.48 mole) in water (1.2 l) at 0° C. The diazonium salt solution was then added via cannula to the solution of potassium ethanethiolate and the reaction mixture was stirred 30 minutes in an ice bath. Diethyl ether (~1.5 l) was added and the mixture was stirred 1.5 hours at room temperature. The ether layer was separated, the aqueous phase further extracted with diethyl ether (3×700 ml), and the combined ether solutions concentrated. The residue was eluted from silica gel with ethyl acetate:hexane (1:19) to give a mixture of methyl 3-ethylthiophenylacetate <sup>1</sup>H NMR (DMSO-d<sub>6</sub>, 200 MHz) δ: 1.21 (t, J=7 Hz, 3H, ethyl CH<sub>3</sub>), 2.95 (s, 2H, ARCH<sub>2</sub>), 3.60 (s, 3H, OCH<sub>3</sub>), 3.65 (s, 2H, ARCH<sub>2</sub>), 7.02–7.44 (m, Ar), and methyl phenylacetate (85.9 g). The esters (84 g) were hydrolyzed in a solution of methanol (500 ml) and 6.25N NaOH (100 ml) stirred overnight at room

temperature. The solution was concentrated in vacuo to remove the methanol, the remaining solution acidified with concentrated HCl and the resulting solid was extracted into diethyl ether. The ether solution was washed with brine (3×100 ml), dried (Na<sub>2</sub>SO<sub>4</sub>) and concentrated. Vacuum distillation (0.5 mm Hg) gave a distillate (100°–115° C.) of phenylacetic acid and a residue of 3-ethylthiophenylacetic acid. The residue in the flask solidified upon cooling to give 3-ethylthiophenylacetic acid (49.8 g). M.p.=49°–51° C. <sup>1</sup>H NMR (DMSO-d<sub>6</sub>, 200 MHz) δ: 1.21 (t, J=7 Hz, 3H, CH<sub>3</sub>), 2.95 (q, J=7 Hz, 2H, SCH<sub>2</sub>), 3.54 (s, 2H, ARCH), 7.01–7.28 (m, 4H, Ar), 12.33 (br s, 1H, CO<sub>2</sub>H). ### EXAMPLE 1

#### 3-Amino-9-bromo-5,6-dihydrobenzo[f]quinazolin-1(2H)-one

A solution of sodium ethoxide was prepared by adding freshly cut sodium (2.72 g, 118 mmoles) to absolute ethanol (350 ml). Guanidine hydrochloride (11.3 g, 118 mmoles) was added and the mixture was stirred and heated to reflux under a nitrogen atmosphere. A solution of ethyl 7-bromo-3,4-dihydro-2-hydroxy-1-naphthoate (11.72 g, 39.4 mmoles) in absolute ethanol (75 ml) was added dropwise over 2.5 hours. Refluxing was continued for an additional 21.5 hours, after which time the mixture was cooled to room temperature and filtered. Ethanol was evaporated under reduced pressure to give a yellow-colored foam which was dissolved in 0.1N NaOH (100 ml). The basic solution was extracted with ether and neutralized with acetic acid: water (1:9) to cause precipitation of the product. The precipitate was collected, washed with water and ether, and dried to give 3-amino-9-bromo-5,6-dihydrobenzo[f]quinazolin-1(2H)-one as an off-white powdery solid. (6.45 g, 53%)  $^1H$  NMR ( $DMSO-d_6$ , 80 MHz)  $\delta$ : 2.45–2.90(m, 4H,  $CH_2CH_2$ ); 6.80(br s, 2H,  $NH_2$ ); 7.03–7.29(m, 2H, ArH); 8.60–8.75(m, 1H, Ar); 11.0(br s, 1H, NH). Anal. ### 3-Amino-9-bromobenzo[f]quinazolin-1(2H)-one

#### A. N-(9-Bromo-1,2,5,6-tetrahydro-1-oxobenzo[f]quinazolin-3-yl)-pivalamide

3-Amino-9-bromo-5,6-dihydrobenzo[f]quinazolin-1(2H)-one (5.83 g, 20 mmoles) and pivalic anhydride (200 ml) were stirred and heated to 185° C. under a nitrogen atmosphere for 1 hour. After cooling, excess pivalic anhydride was evaporated under reduced pressure. The residue was triturated with ether:hexanes (1:1) (200 ml), filtered and dried to give N-(9-bromo-1,2,5,6-tetrahydro-1-oxo-benzo[f]quinazolin-3-yl)pivalamide as an off-white solid. ## EXAMPLE 3

## 9-Bromo-5,6-dihydro-3-methylbenzo[f]quinazolin-1(2H)-one

A solution of sodium ethoxide was prepared by adding freshly cut sodium (0.73 g, 32 mmoles) to absolute ethanol (40 ml). Acetamidine hydrochloride (3.2 g, 34 mmoles) was added and the mixture was stirred and heated to reflux under a nitrogen atmosphere. A solution of methyl 7-bromo-3,4-dihydro-2-hydroxy-1-naphthoate (2.98 g, 10.5 mmoles) in a small volume of absolute ethanol was added rapidly.

After 20 hours of refluxing, the mixture was cooled and neutralized with glacial acetic acid to cause precipitation of the product. The precipitate was collected, washed with water and ethanol, and dried to give 9-bromo-5,6-dihydro-3-methylbenzo[f]quinazolin-1(2H)-one as a white solid. (2.21 g, 72%) <sup>1</sup>H NMR (DMSO-d<sub>6</sub>, 200 MHz) δ: 2.30(s, 3H, CH<sub>3</sub>); 2.65-2.85(m, 4H, CH<sub>2</sub>CH<sub>2</sub>); 7.17(d, J=8.0 Hz, 1H, Ar); 7.35(dd, J=8.0, 2.2 Hz, 1H, Ar); 8.76(d, J=2.2 Hz, 1H, Ar); 12.67(br s, 1H, NH).

The following compounds were prepared from appropriately substituted methyl or ethyl 3,4-dihydro-2-hydroxy-1-naphthoates, using the procedure described in the above example without significant modification:

#### EXAMPLE 34

(S)-2-(2,3-Dihydro-6-(((1,2-dihydro-3-methyl-1-oxobenzo[f]quinazolin-9-yl)methyl)amino)-3-oxo-1,2-benzisothiazol-2-yl)glutaric acid

A. 2,2'-Dithiobis(4-nitrobenzoic acid) (Adapted from Organic Syntheses Coll. Vol. 2, p. 580).

A suspension of 4-nitroanthranilic acid (32.7 g, 180 mmol) (Aldrich) in water (100 ml) and concentrated HCl (35 ml) was stirred 30 minutes at room temperature and then

chilled in an ice bath. A solution of sodium nitrite (12.4 g, 180 mmol) in water (25 ml) was added in small aliquots below the surface of the suspension via pipette. Crushed ice was added during the addition to maintain an internal temperature below 5° C. The reaction mixture was then stirred 1 hour at 0° C.

In a 1 liter flask, sulphur (6.4 g, 0.20 mole) and Na<sub>2</sub>S<sub>9</sub>H<sub>2</sub>O (48 g, 0.20 mole) were dissolved in hot water (100 ml). A solution of NaOH (7.2 g, 0.18 mole) in water (40 ml) was added and the resulting solution cooled in an ice bath. The solution of diazonium salt was then added in aliquots (15–25 ml) along with crushed ice to maintain an internal temperature below 5° C. The reaction mixture was stirred 2 hours at room temperature, filtered, and the filtrate adjusted to neutral pH with acetic acid. The solution was treated with activated charcoal (5 g), filtered, adjusted to pH 2.5–3.0 with concentrated HCl and the resulting precipitate was filtered and washed with water. The solid was nearly dissolved in hot ethanol (200 ml), treated with activated charcoal (5 g), filtered, concentrated in vacuo, then resuspended in methanol (~80 ml), filtered and dried under reduced pressure at 110° C. to give crude 2,2'-dithiobis(4-nitrobenzoic acid) (9.9 g). An analytical sample was prepared by recrystallization from methanol and was dried under reduced pressure at 120° C. <sup>1</sup>H NMR (DMSO-d<sub>6</sub>, 300 MHz) δ: 8.15 (dd, J=9.2 Hz, 1H, Ar), 8.27 (d, J=9 Hz, 1H, Ar), 8.39 (d, J=2 Hz, 1H, Ar). Anal. Calculated for C<sub>14</sub>H<sub>8</sub>N<sub>2</sub>O<sub>8</sub>S<sub>2</sub>: C, 42.43; H, 2.03; N, 7.07; S, 16.18. Found: C, 42.48; H, 2.04; N, 7.12; S, 16.25.

B. Diethyl (S)-2-(2,3-dihydro-6-nitro-3-oxo-1,2-benzisothiazol-2-yl)glutarate

A solution of crude 2,2'-dithiobis(4-nitrobenzoic acid) (8.35 g, ~21 mmol) in SOCl<sub>2</sub> (50 ml) was stirred at reflux for 1.5 hours and then concentrated in vacuo. The residual solid was suspended in methylene chloride (50 ml) and Cl<sub>2</sub> (3.3 g, 47 mmol) gas was bubbled in and the solution stirred 1.5 hours at room temperature. Nitrogen gas was then bubbled into the solution until moistened starch-iodine paper indicated the absence of Cl<sub>2</sub>. L-Glutamic acid diethyl ester hydrochloride (6.5 g, 27 mmol) (Aldrich) was then added, followed by the dropwise addition of diisopropylethylamine (~10 ml, ~57 mmol) (Aldrich) and the reaction mixture was stirred under nitrogen for 45 minutes. Additional diisopropylethylamine was added dropwise until formation of white amine hydrochloride fumes above the solution ceased. After a further 30 minutes of stirring, the reaction mixture was concentrated in vacuo onto silica gel (40 g); chromatography on silica gel (200 g), eluting with ethyl acetate:hexane (1:2) gave diethyl (S)-2-(2,3-dihydro-6-nitro-3-oxo-1,2-benzisothiazol-2-yl)glutarate (4.0 g) as an oil. <sup>1</sup>H NMR (DMSO-d<sub>6</sub>, 300 MHz) δ: 1.14 (t, J=7 Hz, 3H, ester CH<sub>3</sub>), 1.18 (t, J=7 Hz, 3H, ester CH<sub>3</sub>), 2.12–2.46 (m, 4H, glu CH<sub>2</sub>CH<sub>2</sub>), 4.01 (q, J=7 Hz, 2H, ester CH<sub>2</sub>), 4.17 (q, J=7 Hz, 2H, ester CH<sub>2</sub>), 5.22–5.29 (m, 1H, glu CH), 8.11 (d, J=9 Hz, 1H, Ar), 8.21 (dd, J=9.2 Hz, 1H, Ar), 9.03 (d, J=2 Hz, 1H, Ar). Additional iron (3×0.25 g, 13 mmol) was added at intervals of 1, 1.25, and 1.75 hours. The reaction mixture was stirred 30 minutes after the last addition, filtered, concentrated in vacuo, and the residue absorbed onto silica gel (20 g) from a methylene

A. Diethyl (E)-N-(4-(2-(1,2-dihydro-3-methyl-1-oxobenzo[f]quinazolin-9-yl)vinyl)benzoyl)-L-glutamate

A solution of 9-bromo-3-methylbenzo[f]quinazolin-1(2H)-one (0.87 g, 3.0 mmol), 4-vinylbenzoic acid (0.87 g, 5.9 mmol), palladium acetate (0.45 g, 2.0 mmol), and tri(2-tolyl) phosphine (1.2 g, 3.9 mmol) in N-methylmorpholine (90 ml) was stirred under nitrogen at reflux for 1 hour. Additional palladium acetate (0.45 g, 2.0 mmol) and tri(2-tolyl)phosphine (1.2 g, 3.9 mmol) were added and the reaction mixture was refluxed for a further 4 hours. The solution was made basic with NaOH, filtered, the filtrate adjusted to neutral and filtered. The resulting filtrate was adjusted to pH 1.5 and the precipitate filtered and dried under high vacuum to give a 2:1 mixture of carboxylic acid to nitrile (225 mg). #### EXAMPLE 41

##### 2,4-Diaminodibenzo[f,h]quinazolin-1(2H)-one

A solution of 9-aminophenanthrene (1.0 g, 5.2 mmol) (Aldrich) and sodium dicyanamide (0.90 g, 10 mmol) in warm acetic acid (50 ml) was allowed to cool to room temperature and stirred for 1 hour. The solution was diluted with water (~200 ml), adjusted to pH 6 with NH<sub>4</sub>OH, and extracted with methylene chloride (200 ml). The organic phase was dried (K<sub>2</sub>CO<sub>3</sub>), concentrated in vacuo, and the residue purified by chromatography on silica gel eluting with ethyl acetate:methylene chloride (1:1) to give an uncyclized adduct (0.82 g). A solution of this solid in diglyme (20 ml) was stirred at reflux under nitrogen for 1 hour and then concentrated in vacuo. The solid was suspended in methylene chloride, filtered, and then eluted on silica gel (15 g) with methanol:methylene chloride (1:9). Solid precipitated upon concentration in vacuo of eluent and was filtered and dried at 85° C. under reduced pressure to give 2,4-diaminodibenzo-[f,h]quinazolin-1(2H)-one (0.26 g).  $^1H$  NMR (DMSO- $d_6$ , 200 MHz)  $\delta$ : 6.24 (brs, 2H, NH<sub>2</sub>), 6.92 (brs, 2H, NH<sub>2</sub>), 7.42–7.80 (m, 4H, Ar), 8.57 (dd, J=8, 2 Hz, 1H, Ar), 8.67 (d, J=8 Hz, 2H, Ar), 8.94 (dd, J=8, 2 Hz, 1H, Ar). ##### 2-Aminodibenzo[f,h]quinazolin-4(3H)-one

A suspension of 2,4-diaminodibenzo[f,h]quinazolin-1(2H)-one (0.20 g, 0.76 mmol) in 1N HCl (150 ml) was stirred at reflux for 24 h, then neutralized with NH<sub>4</sub>OH. The resulting solid was filtered, washed with water and methanol, then suspended in warm methanol (50 ml) for 20 minutes, filtered and dried at 90° C. under reduced pressure. The solid was nearly dissolved in ethanol (100 ml) and 1N NaOH (~1.5 ml), filtered, and the filtrate neutralized with acetic acid to give a precipitate which was filtered, washed with ethanol, and dried at 90° C. under reduced pressure. The solid was briefly heated to reflux in pivalic anhydride (4 ml), the

solution concentrated in vacuo, and the residue subjected to chromatography on silica gel, eluting with methylene chloride containing a small percentage of ethyl acetate. The pivalamide (not characterized) was hydrolyzed in a solution of methanol (9 ml) and 1N NaOH (1 ml) at reflux for 1.5 hours. The solution was neutralized with acetic acid, and the precipitate filtered, washed with methanol and dried at 90° C. under reduced pressure to give 2-aminodibenzo[f,h]quinazolin-4-(3H)-one as a beige solid (0.10 g). <sup>1</sup>H NMR (DMSO-d<sub>6</sub>, 200 MHz) δ: 6.69 (br s, 2H, NH<sub>2</sub>), 7.47–7.84 (m, 4H, Ar), 8.66–8.80 (m, 2H, Ar), 8.96 (dd, J=8, 1 Hz, 1H, Ar), 9.75–9.83 (m, 1H, Ar), 11.26 (br s, 1H, NH). Mass spectrum (CI-CH<sub>4</sub>) 262 (M+1, 100%). Anal. Calculated for C<sub>16</sub>H<sub>11</sub>N<sub>3</sub>O: C, 73.55; H, 4.24; N, 16.08. Found: C, 73.52; H, 4.27; N, 16.03.

#### Biological Test Data

The procedures used for evaluation of compounds of the invention as antitumour agents are detailed below.

#### Thymidylate Synthase Inhibition

Human thymidylate synthase(TS) from a SV40-transformed human fibroblast cell was cloned in *Escherichia coli* (I. Dev and W. Dallas, personal communication) and the protein purified to homogeneity by affinity chromatography (Rode, W., Scanlon, K. J., Hynes, J. B., Bertino, J. R., *J. Biol. Chem.*, 254, 1979, 11538).

The enzymes were assayed, and extent of inhibition of the enzyme by the various compounds was determined by the tritium release assay of Roberts (*Biochemistry*, 5, 1966, 3546.) as modified by Dev et al. (*J. Biol. Chem.*, 264, 1989, 19132).

Inhibition of the growth of tumor cells was determined as described previously (Patil, S. D., Jones, C., Nair, M. G., Galivan, J., Maley, F., Kisliuk, R. L., Gaumont, Y., Duch, D., and Ferone, R., *J. Med. Chem.*, 32, 1989, 1284) and modified as indicated below.

#### Cells and Medium

SW480 and WiDr colon adenocarcinomas, MCF-7 breast adenocarcinoma, A427 lung carcinoma and MOLT-4 T-cell leukemia were used for the primary screening of com-

pounds. WiDr and MOLT-4 cells were grown in RPMI 1640 medium supplemented with 10 nM calcium leucovorin instead of folic acid as the folate source, 10% dialyzed fetal calf serum, penicillin and streptomycin. MCF-7, A427 and SW480 were grown in the above medium further supplemented with sodium pyruvate. (110 g/ml).

#### Cytotoxicity Assay

Cells are seeded into 96-well plates using a Perkin-Elmer Pro/pette. SW480 and A427 were seeded at 8,000 cells per well, MCF-7 at 10,000, WiDr at 7500, and MOLT-4 at 12,500 cells per well, all in 150 l of medium. Prior to the addition of drugs, cultures were incubated for 24 hrs at 37°. Compounds were added at 2× concentration in 150 l of medium and each concentration was assayed in triplicate. If DMSO or ethanol were used to solubilize compounds, appropriate controls were run if the concentration exceeded 0.01%. Cultures were incubated for 72 hours (96 hours for SW480 and MCF-7) in a 37° humidified incubator at 5% CO<sub>2</sub>. Inhibition of cell growth was measured using the MTT dye reduction assay.

#### MTT Dye Reduction Assay

Cell dilutions for a standard curve were prepared from a 72 hour log-phase culture. Serial dilutions were seeded in triplicate in 96-well plates and incubated at 37 degrees for one hour. MTT (3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide) was dissolved in PBS at 5 mg/ml and sonicated for 30 seconds. Using the Perkin Elmer Pro/pette, 200 µl of medium was removed and 100 µl of MTT added to the wells of the standard curve and test plates. Suspension cultures were spun for 5 min at 1000 rpm before removing medium from the wells. Plates were incubated for 1 hour at 37° on a platform shaker. Following this incubation, 100 µl of medium was removed from the wells and 100 µl of DMSO added to each well. The plates were sonicated for approximately 10 seconds to solubilize the precipitated formazan dye. The absorbance of each well was measured using a Titertek Multiscan MC microtiter plate reader at 570 nm with a reference wavelength of 750 nm. Data was collected using a Mariachi Seed-2 and stored and analyzed using an IBM-AT and Lotus 1-2-3 software.
