**BENZOXAZINONE AND  
BENZOPYRIMIDINONE PIPERIDINYL  
TOCOLYTIC OXYTOCIN RECEPTOR  
ANTAGONISTS**

**FIELD OF THE INVENTION**

This application is a continuation of prior application PCT/US94/07784, filed 14 Jul. 1994, which is a continuation-in-part of prior application U.S. Ser. No. 08/092,840, filed Jul. 16, 1993, now abandoned the contents of which are hereby incorporated by reference.

The present invention provides novel compounds, novel compositions, methods of their use and methods of their manufacture, such compounds generally pharmacologically useful as agents in obstetric and gynecologic therapy. The aforementioned pharmacologic activities are useful in the treatment of mammals. More specifically, the compounds of the present invention can be used in the treatment of preterm labor, stopping labor preparatory to Caesarean delivery, and in the treatment of dysmenorrhea. At the present time, there is a need in the area of obstetric and gynecologic therapy for such agents.

**BACKGROUND OF THE INVENTION**

In the field of obstetrics, one of the most important problems is the management of preterm labor. A significant number of the pregnancies progressing past 20 weeks of gestation experience premature labor and delivery, which is a leading cause of neonatal morbidity and mortality. Despite major advances in neonatal care, retention of the fetus in utero is preferred in most instances.

Tocolytic (uterine-relaxing) agents that are currently in use include  $\beta_2$ -adrenergic agonists, magnesium sulfate and ethanol. Ritodrine, the leading  $\beta_2$ -adrenergic agonist, causes a number of cardiovascular and metabolic side effects in the mother, including tachycardia, increased renin secretion, hyperglycemia (and reactive hypoglycemia in the infant). Other  $\beta_2$ -adrenergic agonists, including terbutaline and albuterol have side effects similar to those of ritodrine. Magnesium sulfate at plasma concentrations above the therapeutic range of 4 to 8 mg/dL can cause inhibition of cardiac conduction and neuromuscular transmission, respiratory depression and cardiac arrest, thus making this agent unsuitable when renal function is impaired. Ethanol is as effective as ritodrine in preventing premature labor, but it does not produce a corresponding reduction in the incidence of fetal respiratory distress that administration of ritodrine does.

It has been proposed that a selective oxytocin antagonist would be the ideal tocolytic agent. In the last few years, evidence has accumulated to strongly suggest that the hormone oxytocin may be a physiological initiator of labor in several mammalian species including humans. Oxytocin is believed to exert this effect in part by directly contracting the uterine myometrium and in part by enhancing the synthesis and release of contractile prostaglandins from the uterine endometrium/decidua. These prostaglandins may, in addition, be important in the cervical ripening process. By these mechanisms, the process of labor (term and preterm) is initiated by a heightened sensitivity of the uterus to oxytocin, resulting in part as a result of a well-documented increase in the number of oxytocin receptors in this tissue. This "up-regulation" of oxytocin receptors and enhanced uterine sensitivity appears to be due to trophic effects of rising plasma levels of estrogen towards term. By blocking oxytocin, one would block both the direct (contractile) and

indirect (enhanced prostaglandin synthesis) effects of oxytocin on the uterus. A selective oxytocin blocker, or antagonist, would likely be more efficacious for treating preterm labor than current regimens. In addition, since oxytocin at term has major effects only on the uterus, such an oxytocin antagonizing compound would be expected to have few, if any, side effects.

The compounds of the present invention can also be useful in the treatment of dysmenorrhea. This condition is characterized by cyclic pain associated with menses during ovulatory cycles. The pain is thought to result from uterine contractions and ischemia, probably mediated by the effect of prostaglandins produced in the secretory endometrium. By blocking both the direct and indirect effects of oxytocin on the uterus, a selective oxytocin antagonist can be more efficacious for treating dysmenorrhea than current regimens. An additional use for the present invention is for the stoppage of labor preparatory to Caesarean delivery.

It is, therefore, a purpose of this invention to provide substances which more effectively antagonize the function of oxytocin in disease states in animals, preferably mammals, especially in humans. It is another purpose of this invention to prepare novel compounds which more selectively inhibit oxytocin. It is still another purpose of this invention to provide a method of antagonizing the functions of oxytocin in disease states in mammals. It is also a purpose of this invention to develop a method of preventing or treating oxytocin-related disorders of preterm labor and dysmenorrhea by antagonizing oxytocin.

It has now been found that compounds of the present invention are antagonists of oxytocin and bind to the oxytocin receptor. When the oxytocin receptor is bound by the compounds of the present invention, oxytocin is antagonized by being blocked from its receptor and thus being unable to exert its biologic or pharmacologic effects. These compounds are useful in the treatment and prevention of oxytocin-related disorders of animals, preferably mammals and especially humans. These disorders are primarily preterm labor and dysmenorrhea. The compounds would also find usefulness for stoppage of labor preparatory to Caesarean delivery. Additionally, such compounds are useful in inducing contraception in mammals inasmuch as oxytocin antagonists have now been shown to inhibit the release of oxytocin-stimulated luteinizing hormone (LH) by anterior pituitary cells.

Compounds of the present invention are also inhibitors of vasopressin and can bind to the vasopressin receptor. These compounds are useful in inducing vasodilation, treating hypertension, inducing diuresis and inhibiting platelet agglutination

The ability of the compounds of the present invention to antagonize oxytocin makes these compounds useful as pharmacologic agents for mammals, especially for humans, for the treatment and prevention of disorders wherein oxytocin may be involved. Examples of such disorders include preterm labor and especially dysmenorrhea. These compounds may also find usefulness for stoppage of labor preparatory to Cesarean delivery.

The compounds of the present invention also bind to the vasopressin receptor and are therefore useful as vasopressin antagonists. Vasopressin antagonists are useful in the treatment or prevention of disease states involving vasopressin disorders, including their use as diuretics and their use in congestive heart failure.

In addition, the compounds of the instant invention are useful for improving fertility rates in farm animals. In certain farm animals (sheep, cattle, swine, goats), the secretion of oxytocin from the ovary and/or pituitary acts on the uterine endometrium to stimulate the secretion of prostaglandins which in ram, causes the regression of the corpus luteum of the ovary. In the cycling animal, destruction of the corpus luteum removes the source of progesterone that is key to the preparation of the uterus for pregnancy. In the animal where fertilization has occurred, the conceptus secretes a factor that antagonizes the action of oxytocin to induce luteolysis, resulting in the continued secretion of progesterone. The maintenance of a functioning corpus luteum is obligatory to the initiation of pregnancy. An oxytocin antagonist given at this critical period supplements the natural signal from the conceptus to prolong corpus luteal function. The result is to increase pregnancy rates by enhancing the chances of impregnation through a reduction in embryonic loss.

The compounds of the present invention can be administered in such oral dosage forms as tablets, capsules (each including timed release and sustained release formulations), pills, powders, granules, elixers, tinctures, suspensions, syrups and emulsions. Likewise, they may also be administered

in intravenous (both bolus and infusion), intraperitoneal, subcutaneous or intramuscular form, all using forms well known to those of ordinary skill in the pharmaceutical arts. An effective but non-toxic amount of the compound desired can be employed as a tocolytic agent.

The dosage regimen utilizing the compounds of the present invention is selected in accordance with a variety of factors including type, species, age, weight, sex and medical condition of the patient; the severity of the condition to be treated; the route of administration; the renal and hepatic function of the patient; and the particular compound or salt thereof employed. An ordinarily skilled physician or veterinarian can readily determine and prescribe the effective amount of the drug required to prevent, counter or arrest the progress of the condition.

Oral dosages of the present invention, when used for the indicated effects, will range between about 0.1–6.0 gm/day orally. Intravenously, the most preferred doses will range from 0.1 to about 10 mg/minute during a constant rate infusion. Advantageously, compounds of the present invention may be administered in a single daily dose, or the total daily dosage may be administered in divided doses of two, three or four times daily. Furthermore, preferred compounds for the present invention can be administered in intranasal form via topical use of suitable intranasal vehicles, or via transdermal routes, using those forms of transdermal skin patches well known to those of ordinary skill in that art. To be administered in the form of a transdermal delivery system, the dosage administration will, of course, be continuous rather than intermittent throughout the dosage regimen.

In the methods of the present invention, the compounds herein described in detail can form the active ingredient, and are typically administered in admixture with suitable pharmaceutical diluents, excipients or carriers (collectively referred to herein as "carrier" materials) suitably selected with respect to the intended form of administration, that is, oral tablets, capsules, elixirs, syrups and the like, and consistent with conventional pharmaceutical practices.

For instance, for oral administration in the form of a tablet or capsule, the active drug component can be combined with an oral, non-toxic pharmaceutically acceptable inert carrier such as ethanol, glycerol, water and the like. Moreover, when desired or necessary, suitable binders, lubricants, disintegrating agents and coloring agents can also be incorporated into the mixture. Suitable binders include starch, gelatin, natural sugars such as glucose or beta-lactose, corn sweeteners, natural and synthetic gums such as acacia, tragacanth or sodium alginate, carboxymethylcellulose, polyethylene glycol, waxes and the like. Lubricants used in these dosage forms include sodium oleate, sodium stearate, magnesium stearate, sodium benzoate, sodium acetate, sodium chloride and the like. Disintegrators include, without limitation, starch, methyl cellulose, agar, bentonite, zanthan gum and the like.

The compounds of the present invention may also be coupled with soluble polymers as targetable drug carriers. Such polymers can include polyvinylpyrrolidone, pyran

copolymer, polyhydroxypropylmethacrylamidephenol, polyhydroxyethylaspartamidephenol, or polyethyleneoxide-polylysine substituted with palmitoyl residues. Furthermore, the compounds of the present invention may be coupled to a class of biodegradable polymers useful in achieving controlled release of a drug, for example, polylactic acid, polepsilon caprolactone, polyhydroxy butyric acid, polyorthoesters, polyacetals, polydihydropyrans, polycyanoacrylates and cross-linked or amphipathic block copolymers of hydrogels.

The compounds of the present invention can be prepared readily according to the following Examples or modifications thereof using readily available starting materials, reagents and conventional synthesis procedures. In these reactions, it is also possible to make use of variants which are themselves known to those of ordinary skill in this art, but are not mentioned in greater detail.

The most preferred compounds of the invention are any or all of those specifically set forth in these Examples. These compounds are not, however, to be construed as forming the only genus that is considered as the invention, and any combination of the compounds or their moieties may itself form a genus. The following examples further illustrate details for the preparation of the compounds of the present invention. #### EXAMPLE 1

1-((1-(2,4,6-Trimethoxybenzoyl)piperidin-4-yl)-1,2-dihydro-4(H)-3,1-benzoxazin-2-one

##### Step 1:

To a stirred, 0° C. solution of 4-piperidinone hydrochloride hydrate (50 g; 0.33 mol) in DMF (500 mL) was added di-*t*-butyldicarbonate (64 g; 0.29 mol) followed by a dropwise addition of DIEA (63 mL; 0.36 mol). After the addition of DIEA was complete, the reaction was allowed to gradually warm to ambient temperature over 4 h and stirring was continued for 20 h. The DMF was removed under reduced pressure and the residue was dissolved in EtOAc (1000 mL) and washed with 5% aqueous citric acid (2×500 mL), water (250 mL), and saturated aqueous NaHCO<sub>3</sub> (500 mL). The EtOAc layer was dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and the EtOAc was removed under reduced pressure. The residue was boiled in ether (ca. 250 mL) until the solid had dissolved. Cooling gave *N*-*t*-butyloxycarbonyl-4-piperidinone as white crystals (47 g; 80% yield).

##### Step 2:

*N*-*t*-butyloxycarbonyl-4-piperidinone (20 g, 0.10 mol) from Step 1, 2-aminobenzyl alcohol (13 g, 0.11 mol), and acetic acid (14 mL, 0.22 mol) were dissolved in dry toluene (500 mL). The solution was refluxed under inert atmosphere with azeotropic removal of water for 16 h. The solution was cooled to ambient temperature and to it was added NaBH<sub>3</sub>CN (14 g, 0.22 mol) and dry THF (200 mL). The reaction was stirred at ambient temperature for 24 h. The reaction was concentrated under reduced pressure and the residue was dissolved in EtOAc (750 mL). The EtOAc layer was washed with saturated aqueous NaHCO<sub>3</sub> (4×500 mL) and brine (250 mL). The EtOAc layer was dried (MgSO<sub>4</sub>), filtered, and the solvent was removed under reduced pressure. The residue was purified by pressurized silica gel column chromatography, using a gradient elution of 15–30%

EtOAc-hexanes. 1-*t*-Butyloxycarbonyl-4-((2-hydroxymethyl)phenylamino)-piperidine was obtained as a gum (24 g, 78% yield).

##### Step 3:

1-*t*-Butyloxycarbonyl-4-((2-hydroxymethyl)phenylamino)piperidine (24 g, 78 mmol) from Step 2 was dissolved in dry THF (250 mL) and cooled to 0° C. To the solution was added DIEA (41 mL, 0.24 mol) and triphosgene (8.54 g, 28.8 mmol). The reaction was stirred at 0° C. for 1 h, and then at ambient temperature for 72 h. Ether (250 mL) was added, the mixture was cooled to 0° C. for 3 h and then filtered to remove the hydrochloride salt of DIEA. The filtrate solvents were removed under reduced pressure and the residue was dissolved in EtOAc (750 mL). The EtOAc solution was washed with 5% aqueous citric acid (2×500 mL), water (250 mL), and saturated aqueous NaHCO<sub>3</sub> (2×500 mL). The EtOAc layer was dried (MgSO<sub>4</sub>), filtered, and the solvent was removed under reduced pressure. The residue was boiled in ether (ca. 200 mL) until the solid had dissolved. Cooling overnight gave 1-((1-*t*-butyloxycarbonyl)piperidin-4-yl)-1,2-dihydro-4(H)-3,1-benzoxazin-2-one as off-white crystals (19 g; 75% yield).

HCl gas was bubbled through the solution for 30 min. Stirring was continued at 0° C. for 1 h, during which time a precipitate had formed, and then at ambient temperature for 1 h. The stirred suspension was cooled to 0° C. and cold ether (250 mL) was added. After 1 h at 0° C., the solid was collected by filtration. The solid was dried under reduced pressure for 18 h, giving the hydrochloride salt of 1-(4-piperidinyl)-1,2-dihydro-4(H)-3,1-benzoxazin-2-one as an off-white solid (14 g, 91% yield).

## EXAMPLE 123

1-(1-(4-(4-piperidinyloxy)-2-methoxyphenylacetyl)piperidin-4-yl)-1,2-dihydro-4(H)-3,1-benzoxazin-2-one

## Step 1:

To a solution of 2-methoxy-(N-t-butyloxycarbonyl-4-piperidyloxy)benzoic acid (3.2 g; 9.1 mmol) from Step 3 of Example 25 in THF was added thionyl chloride (1 mL; 13.7 mmol) and pyridine (2 drops) while under a nitrogen atmosphere. The solution was stirred for 4 hours and then concentrated under reduced pressure to dryness. The residue was suspended in ether and filtered, and the filtrate was concentrated to dryness to yield 2-methoxy-(N-t-butyloxycarbonyl-4-piperidyloxy)benzoyl chloride.

## Step 2:

A two phase mixture of ether (66 mL) and 40% aqueous potassium hydroxide (20 mL) was cooled to 0° C. and N-nitrosomethylurea (6.6 g) was added portionwise over 30 minutes. The resulting yellow diazomethane/ether solution was decanted and dried over potassium hydroxide. The diazomethane/ether solution was decanted and cooled to 0° C. At this point, a solution of 2-methoxy-(N-t-butyloxycarbonyl-4-piperidyloxy)benzoyl chloride from Step 1 above in THF was added dropwise to the diazomethane/ether solution. The resulting bronze solution was warmed to ambient temperature and stirred for 3 hours. Nitrogen was bubbled through the reaction mixture for 1 hour to remove excess diazomethane and the solution was concentrated under reduced pressure to dryness. The residue was purified by pressurized silica gel column chromatography (elute with 6:94 ether:methylene chloride) to yield 2-methoxy-(N-t-butyloxycarbonyl-4-piperidyloxy)phenyldiazomethyl ketone.

## Step 3:

A solution of 2-methoxy-(N-t-butyloxycarbonyl-4-piperidyloxy)phenyldiazomethyl ketone (930 mg; 2.48 mmol) from Step 2 above in dry methanol (7 mL) was refluxed and a solution of freshly prepared silver benzoate (100 mg) in triethylamine (1 mL) was added portionwise over 45 minutes. The solution was refluxed for an additional

30 minutes, then cooled and filtered. The filtrate was concentrated to dryness and the crude oil was purified by pressurized silica gel column chromatography (elute with 5:95 methanol:methylene chloride) to yield methyl-2-methoxy-(N-t-butyloxycarbonyl-4-piperidyloxy)phenyl acetate.

## Step 4:

To a solution of methyl-2-methoxy-(N-t-butyloxycarbonyl-4-piperidyloxy)phenyl acetate (1.37 g; 3.6 mmol) from Step 3 above in 27 mL of THF was added aqueous lithium hydroxide solution (4.5 mL; 1.01M) dropwise. The reaction mixture was stirred for 16 hours and concentrated to dryness under reduced pressure. The residue was partitioned between ethyl acetate and 0.5M aqueous hydrochloric acid. The organic phase was separated and the aqueous phase was extracted with ethyl acetate (2×). The combined organic extracts were dried over sodium sulfate, filtered, and the solvent was removed under reduced pressure to yield 2-methoxy-(N-t-butyloxycarbonyl-4-piperidyloxy)phenylacetic acid.

## Step 5:

To a solution of the hydrochloride salt of 1-(4-piperidinyl)-1,2-dihydro-4(H)-3,1-benzoxazin-2-one from Step 4 of Example 1 (250 mg; 0.93 mmol) in 8 mL of DMF was added 2-methoxy-(N-t-butyloxycarbonyl-4-piperidyloxy)phenylacetic acid (340 mg; 0.93 mmol), 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide hydrochloride (213 mg; 1.11 mmol), and 1-hydroxybenzotriazole hydrate (147 mg; 1.09). Triethylamine (550 μL) was added to make the solution basic (pH 8–9). After stirring for 18 hours, the solvent was removed under reduced pressure. The residue was partitioned between ethyl acetate and sodium bicarbonate (sat., aqueous). The ethyl acetate layer was washed with saturated aqueous sodium bicarbonate and brine, dried, filtered, and concentrated under reduced pressure to an oil. The crude solid was purified by pressurized silica gel column chromatography (elute with 3:97 methanol:methylene chloride). 1-(1-(4-(1-tert-Butyloxycarbonyl-4-piperidinyloxy)-2-methoxyphenylacetyl)piperidin-4-yl)-1,2-dihydro-4(H)-3,1-benzoxazin-2-one was obtained as a white solid from ether.

## Step 6:

1-(1-(4-(1-tert-Butyloxycarbonyl-4-piperidinyloxy)-2-methoxyphenylacetyl)piperidin-4-yl)-1,2-dihydro-4(H)-3,1-benzoxazin-2-one from Step 5 above (0.20 g, 0.35 mmol) was dissolved in ethyl acetate and cooled in an ice bath. Once cool, the solution was saturated with gaseous HCl for 30 minutes. The mixture was evaporated to dryness. Ether was added and removed in vacuo three times, and the residue was triturated with ether and filtered to yield the hydrochloride salt of the title compound as a white solid.

A solution of 1-(1-(4-(4-piperidinyloxy)-2-methoxyphenylacetyl)piperidin-4-yl)-1,2-dihydro-4(H)-3,1-benzoxazin-2-one (154 mg; 0.30 mmol) from Example 118 and diisopropylethylamine (0.26 mL) in methylene chloride (3 mL) was added dropwise. The resulting solution was allowed to slowly warm to ambient temperature and stirred for 18 hours. The solvent was removed under reduced pressure and the resulting residue was purified by flash chromatography (elute with 3:97 methanol:methylene chloride). 1-(1-(4-(1-Vinylsulfonyl-4-piperidinyloxy)-2-methoxyphenylacetyl)-piperidin-4-yl)-1,2-dihydro-4(H)-3,1-benzoxazin-2-one was obtained as a white solid by precipitation from ether.

This material was carded to the next synthetic step without further purification.

Step 4. 1-(1-(4-(4-(N-t-Butyloxycarbonyl)piperidinyloxy)-2-methoxybenzoyl)piperidin-4-yl)

tetrahydroquinolin-2-thione (1.2 g) was converted quantitatively with HCl gas to the hydrochloride salt of 1-(1-(4-(4-piperidinyloxy)-2-methoxybenzoyl)piperidin-4-yl)-tetrahydroquinolin-2-thione according to the procedure described in Example 1, Step 4.

Step 5. 1-(1-(4-(4-Piperidinyloxy)-2-methoxybenzoyl)piperidin-4-yl)-tetrahydroquinolin-2-thione hydrochloride (1.0 g) was dissolved in 25 ml of methylene chloride containing 0.73 ml of triethylamine. To this solution was added 0.195 ml of acetyl chloride and the reaction mixture was stirred for 3 hr. The reaction mixture was diluted with methylene chloride and was washed in succession with saturated sodium bicarbonate solution and brine. Rot-evaporation of the dried organic extracts gave the crude product which was purified to homogeneity via flash chromatography on silica gel (chloroform-isopropanol, 99:1, v/v). In this way, 800 mg the title compound was obtained as an amorphous solid.

## RADIOLIGAND BINDING ASSAYS

The high affinity binding of [ $^3H$ ]Oxytocin (OT)([tyrosyl-3,5- $^3H$ ]OT; 30-60 Ci/mmol; New England Nuclear, Boston, Mass.) to uterine OT receptors was based on an assay (Fuchs, A-R; Fuchs, F; Soloff, MS. 1985 *J. Clin. Endocrinol. Metab.* 60:37) using a crude membrane preparation of uteri taken from diethylstilbestrol dipropionate (DES)-treated (0.3 mg/kg, ip; 18-24) rats. Competition studies were conducted at equilibrium (60 minutes; 22° C.) using 1 nM [ $^3H$ ]OT in the following assay buffer: 50 mM Tris-HCl, 5 mM  $MgCl_2$ , and 0.1% BSA, pH 7.4. Nonspecific binding (10% of the total binding) was determined using 1  $\mu M$  unlabeled OT and the binding reaction was terminated by filtration through glass fiber filters using a cell harvester (model 7019, Skatron, Inc., Sterling, Va.).  $IC_{50}$  values (the concentration of tested compound that inhibits 50% of OT) were reported.

The measurement of [ $^3H$ ]Vasopressin (AVP) ([phenylalanyl-3,4,5- $^3H$ ]AVP; 80-90 Ci/mmol; New England Nuclear) binding to a crude membrane preparation of male rat liver (AVP- $V_1$  sites) or kidney medulla (AVP- $V_2$  sites) was determined according to the method of Butlen, et

al. (Butlen, D; Guillon, G; Rajerison, R. M.; Jard, S; Sawyer, W. H.; Manning, M. 1978 *Mol Pharmacol* 14:1006).

Competition assays were conducted at equilibrium (30 minutes at 30° C.) using 1 nM [ $^3H$ ]AVP (liver) or 2 nM

[<sup>3</sup>H]AVP (kidney) in the following assay buffer: 100 mM Tris-HCl, 5 mM MgCl<sub>2</sub>, 0.1% BSA, 50 mM phenylmethylsulfonyl fluoride, and 50 mg/ml bacitracin, pH 8.0. Nonspecific binding (5–10% of the total binding) was determined using 10 μM unlabeled AVP, and the binding reaction was terminated by filtration as described above for the [<sup>3</sup>H]OT binding assay.

IC<sub>50</sub> values were determined for the [<sup>3</sup>H]OT and [<sup>3</sup>H]AVP binding assays by linear regression of the relation log concentration of compound vs. percent inhibition of specific binding. Data is either reported as a given percentage of inhibition at a specified concentration, or if an IC<sub>50</sub> was calculated, as a nanomolar concentration. Representative IC<sub>50</sub> values of the compounds of the instant invention are given below.
