PYRROLO[1,2-B]PYRIDAZINE DERIVATIVES

CROSSED-REFERENCE TO RELATED APPLICATION

This application claims the benefit of Provisional Patent Application Ser. No. 60/493,997, filed Aug. 7, 2003, the content of which is incorporated by reference.

BACKGROUND OF THE INVENTION

Triglycerides represent the major form of energy stored in eukaryotes. Disorders or imbalances in triglyceride metabolism are implicated in the pathogenesis of and increased risk for obesity, insulin resistance syndrome and type II diabetes, nonalcoholic fatty liver disease and coronary heart disease (see, Lewis, et al, *Endocrine Reviews* (2002) 23:201 and Malloy and Kane, *Adv Intern Med* (2001) 47:111). Additionally, hypertriglyceridemia is often an adverse consequence of cancer therapy (see, Bast, et al. *Cancer Medicine*, 5th Ed., (2000) B. C. Decker, Hamilton, Ontario, Calif.).

A key enzyme in the synthesis of triglycerides is acyl CoA:diacylglycerol acyltransferase, or DGAT. DGAT is a microsomal enzyme that is widely expressed in mammalian tissues and that catalyzes the joining of 1,2-diacylglycerol and fatty acyl CoA to form triglycerides at the endoplasmic reticulum (reviewed in Chen and Farese, *Trends Cardiovasc Med* (2000) 10:188 and Farese, et al, *Curr Opin Lipidol* (2000) 11:229). It was originally thought that DGAT uniquely controlled the catalysis of the final step of acylation of diacylglycerol to triglyceride in the two major pathways for triglyceride synthesis, the glycerol phosphate and monoacylglycerol pathways. Because triglycerides are considered essential for survival, and their synthesis was thought to occur through a single mechanism, inhibition of triglyceride synthesis through inhibiting the activity of DGAT has been largely unexplored.

Genes encoding mouse DGAT1 and the related human homologs ARGPI and ARGPII now have been cloned and characterized (Cases, et al, *Proc Natl Acad Sci* (1998) 95:13018; Oelkers, et al, *J Biol Chem* (1998) 273:26765). The gene for mouse DGAT1 has been used to create DGAT knock-out mice to better elucidate the function of the DGAT gene. Unexpectedly, mice unable to express a functional DGAT enzyme (Dgat^{-/-} mice) are viable and still able to synthesize triglycerides, indicating that multiple catalytic mechanisms contribute to triglyceride synthesis (Smith, et al, *Nature Genetics* (2000) 25:87). Other enzymes that catalyze triglyceride synthesis, for example, DGAT2 and diacylglycerol transacylase, also have been identified (Buhman, *J Biol Chem*, supra and Cases, et al, *J Biol Chem* (2001) 276:38870).

Significantly, Dgat^{-/-} mice are resistant to diet-induced obesity and remain lean. Even when fed a high fat diet (21% fat) Dgat^{-/-} mice maintain weights comparable to mice fed a regular diet (4% fat) and have lower total body triglyceride levels. The obesity resistance in Dgat^{-/-} mice is not due to decreased caloric intake, but the result of increased energy expenditure and decreased resistance to insulin and leptin (Smith, et al, *Nature Genetics*, supra; Chen and Farese, *Trends Cardiovasc Med*, supra; and Chen, et al, *J Clin Invest* (2002) 109:1049). Additionally, Dgat^{-/-} mice have reduced rates of triglyceride absorption (Buhman, et al, *J Biol Chem* (2002) 277:25474). In addition to improved triglyceride metabolism, Dgat^{-/-} mice also have improved glucose metabolism, with lower glucose and insulin levels following

a glucose load, in comparison to wild-type mice (Chen and Farese, *Trends Cardiovasc Med*, supra).

The finding that multiple enzymes contribute to catalyzing the synthesis of triglyceride from diacylglycerol is significant, because it presents the opportunity to modulate one catalytic mechanism of this biochemical reaction to achieve therapeutic results in an individual with minimal adverse side effects. Compounds that inhibit the conversion of diacylglycerol to triglyceride, for instance by specifically inhibiting the activity of the human homolog of DGAT1, will find use in lowering corporeal concentrations and absorption of triglycerides to therapeutically counteract the pathogenic effects caused by abnormal metabolism of triglycerides in obesity, insulin resistance syndrome and overt type II diabetes, congestive heart failure and atherosclerosis, and as a consequence of cancer therapy.

Because of the ever increasing prevalence of obesity, type II diabetes, heart disease and cancer in societies throughout the world, there is a pressing need in developing new therapies to effectively treat and prevent these diseases. Therefore there is an interest in developing compounds that can potently and specifically modulate a single catalytic mechanism of the enzymatic conversion of diacylglycerol to triglyceride. Of particular promise are compounds that specifically inhibit the catalytic activity of DGAT1 and its other mammalian homologs.

The term “alkylene” by itself or as part of another substituent means a divalent radical derived from alkyl, as exemplified by —CH₂CH₂CH₂CH₂—. Typically, an alkyl (or alkylene) group will have from 1 to 24 carbon atoms, with those groups having 10 or fewer carbon atoms being preferred in the present invention. A “lower alkyl” or “lower alkylene” is a shorter chain alkyl or alkylene group, generally having eight or fewer carbon atoms.

The terms “alkoxy,” “alkylamino” and “alkylthio” (or thioalkoxy) are used in their conventional sense, and refer to those alkyl groups attached to the remainder of the molecule via an oxygen atom, an amino group, or a sulfur atom, respectively.

The term “heteroalkyl,” by itself or in combination with another term, means, unless otherwise stated, a stable straight or branched chain, or cyclic hydrocarbon radical, or combinations thereof, consisting of the stated number of carbon atoms and from one to three heteroatoms selected from the group consisting of O, N, Si and S, wherein the nitrogen and sulfur atoms may optionally be oxidized and the nitrogen heteroatom may optionally be quaternized. The heteroatom(s) O, N and S may be placed at any interior position of the heteroalkyl group. The heteroatom Si may be placed at any position of the heteroalkyl group, including the position at which the alkyl group is attached to the remainder of the molecule. Examples include —CH₂—CH₂—O—CH₃, —CH₂—CH₂—NH—CH₃, —CH₂—CH₂—N(CH₃)—CH₃, —CH₂—S—CH₂—CH₃, —CH₂—CH₂—S(O)—CH₃, —CH₂—CH₂—S(O)₂—CH₃, —CH=CH—O—CH₃, —Si(CH₃)₃, —CH₂—CH=N—OCH₃, and —CH=CH—N(CH₃)—CH₃. Up to two heteroatoms may be consecutive, such as, for example, —CH₂—NH—OCH₃ and —CH₂—O—Si(CH₃)₃.

Similarly, the term “heteroalkylene” by itself or as part of another substituent means a divalent radical derived from heteroalkyl, as exemplified by —CH₂—CH₂—S—CH₂CH₂— and —CH₂—S—CH₂—CH₂—NH—CH₂—. For heteroalkylene groups, heteroatoms can also occupy either or both of the chain termini (e.g., alkyleneoxy, alkyleneedioxy, alkyleneamino, alkylenediamino, and the like). Still further, for alkylene and heteroalkylene linking groups, no orientation of the linking group is implied.

The terms “cycloalkyl” and “heterocycloalkyl”, by themselves or in combination with other terms, represent, unless otherwise stated, cyclic versions of “alkyl” and “heteroalkyl”, respectively. Accordingly, a cycloalkyl group has

the number of carbon atoms designated (i.e., C₃-C₈ means three to eight carbons) and may also have one or two double bonds. A heterocycloalkyl group consists of the number of carbon atoms designated and from one to three heteroatoms selected from the group consisting of O, N, Si and S, and wherein the nitrogen and sulfur atoms may optionally be oxidized and the nitrogen heteroatom may optionally be quaternized. Additionally, for heterocycloalkyl, a heteroatom can occupy the position at which the heterocycle is attached to the remainder of the molecule. Examples of cycloalkyl include cyclopentyl, cyclohexyl, 1-cyclohexenyl, 3-cyclohexenyl, cycloheptyl, and the like. Examples of heterocycloalkyl include 1-(1,2,5,6-tetrahydropyridyl), 1-piperidyl, 2-piperidyl, 3-piperidyl, 4-morpholinyl, 3-morpholinyl, tetrahydrofuran-2-yl, tetrahydrofuran-3-yl, tetrahydrothien-2-yl, tetrahydrothien-3-yl, 1-piperazinyl, 2-piperazinyl, and the like.

The terms “halo” and “halogen,” by themselves or as part of another substituent, mean, unless otherwise stated, a fluorine, chlorine, bromine, or iodine atom. Additionally, terms such as “haloalkyl” or “fluoroalkyl” are meant to include alkyl substituted with halogen atoms, which can be the same or different, in a number ranging from one to (2 m'+1), where m' is the total number of carbon atoms in the alkyl group. For example, the term “halo(C₁-C₄)alkyl” is meant to include trifluoromethyl, 2,2,2-trifluoroethyl, 4-chlorobutyl, 3-bromopropyl, and the like. Thus, the term “haloalkyl” includes monohaloalkyl (alkyl substituted with one halogen atom) and polyhaloalkyl (alkyl substituted with halogen atoms in a number ranging from two to (2 m'+1) halogen atoms, where m' is the total number of carbon atoms in the alkyl group). The term “perhaloalkyl” means, unless otherwise stated, alkyl substituted with (2 m'+1) halogen atoms, where m' is the total number of carbon atoms in the alkyl group. For example the term “perhalo(C₁-C₄)alkyl” is meant to include trifluoromethyl, pentachloroethyl, 1,1,1-trifluoro-2-bromo-2-chloroethyl and the like.

The term “aryl” means, unless otherwise stated, a polyunsaturated, typically aromatic, hydrocarbon substituent which can be a single ring or multiple rings (up to three rings) which are fused together or linked covalently. Non-limiting examples of aryl groups include phenyl, 1-naphthyl, 2-naphthyl, 4-biphenyl and 1,2,3,4-tetrahydronaphthalene.

The term “heteroaryl” refers to aryl groups (or rings) that contain from zero to four heteroatoms selected from N, O, and S, wherein the nitrogen and sulfur atoms are optionally oxidized and the nitrogen heteroatom are optionally quaternized. A heteroaryl group can be attached to the remainder of the molecule through a heteroatom. Non-limiting examples of heteroaryl groups include 1-pyrrolyl, 2-pyrrolyl, 3-pyrrolyl, 3-pyrazolyl, 2-imidazolyl, 4-imidazolyl, pyrazinyl, 2-oxazolyl, 4-oxazolyl, 2-phenyl-4-oxazolyl, 5-oxazolyl, 3-isoxazolyl, 4-isoxazolyl, 5-isoxazolyl, 2-thiazolyl, 4-thiazolyl, 5-thiazolyl, 2-furyl, 3-furyl, 2-thienyl, 3-thienyl, 2-pyridyl, 3-pyridyl, 4-pyridyl, 2-pyrimidyl, 4-pyrimidyl, 5-benzothiazolyl, purinyl, 2-benzimidazolyl, 5-indolyl, 1-isoquinolyl, 5-isoquinolyl, 2-quinoxalyl, 5-quinoxalyl, 3-quinolyl and 6-quinolyl.

For brevity, the term “aryl” when used in combination with other terms (e.g., aryloxy, arylthioxy, arylalkyl) includes both aryl and heteroaryl rings as defined above. Thus, the term “arylalkyl” is meant to include those radicals in which an aryl group is attached to an alkyl group (e.g., benzyl, phenethyl, pyridylmethyl and the like) including those alkyl groups in which a carbon atom (e.g., a methylene

group) has been replaced by, for example, an oxygen atom (e.g., phenoxymethyl, 2-pyridyloxymethyl, 3-(1-naphthoxy)propyl, and the like).

Each of the above terms (e.g., "alkyl," "heteroalkyl," "aryl" and "heteroaryl") is meant to include both substituted and unsubstituted forms of the indicated radical. Preferred substituents for each type of radical are provided below.

Substituents for the alkyl and heteroalkyl radicals (as well as those groups referred to as alkylene, alkenyl, heteroalkylene, heteroalkenyl, alkynyl, cycloalkyl, heterocycloalkyl, cycloalkenyl and heterocycloalkenyl) can be a variety of groups selected from: $-\text{OR}'$, $=\text{O}$, $=\text{NR}'$, $=\text{N}-\text{OR}'$, $-\text{NR}'\text{R}''$, $-\text{SR}'$, halogen, $-\text{SiR}'\text{R}''\text{R}'''$, $-\text{OC}(\text{O})\text{R}'$, $-\text{C}(\text{O})\text{R}'$, $-\text{CO}_2\text{R}'$, $-\text{CONR}'\text{R}''$, $-\text{OC}(\text{O})\text{NR}'\text{R}''$, $-\text{NR}''\text{C}(\text{O})\text{R}'$, $-\text{NR}'-\text{C}(\text{O})\text{NR}''\text{R}'''$, $-\text{NR}'-\text{SO}_2\text{NR}''\text{R}'''$, $-\text{NR}''\text{CO}_2\text{R}'$, $-\text{NH}-\text{C}(\text{NH}_2)=\text{NH}$, $-\text{NR}'\text{C}(\text{NH}_2)=\text{NH}$, $-\text{NH}-\text{C}(\text{NH}_2)=\text{NR}'$, $-\text{S}(\text{O})\text{R}'$, $-\text{SO}_2\text{R}'$, $-\text{SO}_2\text{NR}'\text{R}''$, $-\text{NR}''\text{SO}_2\text{R}$, $-\text{OPO}(\text{OR}')(\text{OR}'')$, $-\text{CN}$ and $-\text{NO}_2$, in a number ranging from zero to three, with those groups having zero, one or two substituents being particularly preferred. R' , R'' and R''' each independently refer to hydrogen, unsubstituted (C_1-C_8) alkyl and heteroalkyl, unsubstituted aryl, aryl substituted with one to three halogens, unsubstituted alkyl, alkoxy or thioalkoxy groups, or aryl- (C_1-C_4) alkyl groups. When R' and R'' are attached to the same nitrogen atom, they can be combined with the nitrogen atom to form a 5-, 6- or 7-membered ring. For example, $-\text{NR}'\text{R}''$ is meant to include 1-pyrrolidinyl and 4-morpholinyl. Typically, an alkyl or heteroalkyl group will have from zero to three substituents, with those groups having two or fewer substituents being preferred in the present invention. More preferably, an alkyl or heteroalkyl radical will be unsubstituted or monosubstituted. Most preferably, an alkyl or heteroalkyl radical will be unsubstituted. From the above discussion of substituents, one of skill in the art will understand that the term "alkyl" is meant to include groups such as trihaloalkyl (e.g., $-\text{CF}_3$ and $-\text{CH}_2\text{CF}_3$).

Preferred substituents for the alkyl and heteroalkyl radicals are selected from: $-\text{OR}'$, $=\text{O}$, $-\text{NR}'\text{R}''$, $-\text{SR}'$, halogen, $-\text{SiR}'\text{R}''\text{R}'''$, $-\text{OC}(\text{O})\text{R}'$, $-\text{C}(\text{O})\text{R}'$, $-\text{CO}_2\text{R}'$, $-\text{CONR}'\text{R}''$, $-\text{OC}(\text{O})\text{NR}'\text{R}''$, $-\text{NR}''\text{C}(\text{O})\text{R}'$, $-\text{NR}''\text{CO}_2\text{R}'$, $-\text{NR}'-\text{SO}_2\text{NR}''\text{R}'''$, $-\text{S}(\text{O})\text{R}'$, $-\text{SO}_2\text{R}'$, $-\text{SO}_2\text{NR}'\text{R}''$, $-\text{NR}''\text{SO}_2\text{R}$, $-\text{CN}$ and $-\text{NO}_2$, where R' and R'' are as defined above. Further preferred substituents are selected from: $-\text{OR}'$, $=\text{O}$, $-\text{NR}'\text{R}''$, halogen, $-\text{OC}(\text{O})\text{R}'$, $-\text{CO}_2\text{R}'$, $-\text{CONR}'\text{R}''$, $-\text{OC}(\text{O})\text{NR}'\text{R}''$, $-\text{NR}''\text{C}(\text{O})\text{R}'$, $-\text{NR}''\text{CO}_2\text{R}'$, $-\text{NR}'-\text{SO}_2\text{NR}''\text{R}'''$, $-\text{SO}_2\text{R}'$, $-\text{SO}_2\text{NR}'\text{R}''$, $-\text{NR}''\text{SO}_2\text{R}$, $-\text{CN}$ and $-\text{NO}_2$.

Similarly, substituents for the aryl and heteroaryl groups are varied and selected from: halogen, $-\text{OR}'$, $-\text{OC}(\text{O})\text{R}'$, $-\text{NR}'\text{R}''$, $-\text{SR}'$, $-\text{R}'$, $-\text{CN}$, $-\text{NO}_2$, $-\text{CO}_2\text{R}'$, $-\text{CONR}'\text{R}''$, $-\text{C}(\text{O})\text{R}'$, $-\text{OC}(\text{O})\text{NR}'\text{R}''$, $-\text{NR}''\text{C}(\text{O})\text{R}'$, $-\text{NR}''\text{CO}_2\text{R}'$, $-\text{NR}'-\text{C}(\text{O})\text{NR}''\text{R}'''$, $-\text{NR}'-\text{SO}_2\text{NR}''\text{R}'''$, $-\text{NH}-\text{C}(\text{NH}_2)=\text{NH}$, $-\text{NR}'\text{C}(\text{NH}_2)=\text{NH}$, $-\text{NH}-\text{C}(\text{NH}_2)=\text{NR}'$, $-\text{S}(\text{O})\text{R}'$, $-\text{SO}_2\text{R}'$, $-\text{SO}_2\text{NR}'\text{R}''$, $-\text{NR}''\text{SO}_2\text{R}$, $-\text{N}_3$, $-\text{CH}(\text{Ph})_2$, perfluoro (C_1-C_4) alkoxy and perfluoro (C_1-C_4) alkyl, in a number ranging from zero to the total number of open valences on the aromatic ring system; and where R' , R'' and R''' are independently selected from hydrogen, (C_1-C_8) alkyl and heteroalkyl, unsubstituted aryl and heteroaryl, (unsubstituted aryl)- (C_1-C_4) alkyl and (unsubstituted aryl)oxy- (C_1-C_4) alkyl. When the aryl group is 1,2,3,4-tetrahydronaphthalene, it may be substituted with a substituted or unsubstituted (C_3-C_7) spirocycloalkyl group. The (C_3-C_7) spirocycloalkyl group may be substituted in the same manner as defined herein for "cycloalkyl". Typically, an aryl or heteroaryl group will have from zero to three

substituents, with those groups having two or fewer substituents being preferred in the present invention. In one embodiment of the invention, an aryl or heteroaryl group will be unsubstituted or monosubstituted. In another embodiment, an aryl or heteroaryl group will be unsubstituted.

Preferred substituents for aryl and heteroaryl groups are selected from: halogen, $-\text{OR}'$, $-\text{OC}(\text{O})\text{R}'$, $-\text{NR}'\text{R}''$, $-\text{SR}'$, $-\text{R}'$, $-\text{CN}$, $-\text{NO}_2$, $-\text{CO}_2\text{R}'$, $-\text{CONR}'\text{R}''$, $-\text{C}(\text{O})\text{R}'$, $-\text{OC}(\text{O})\text{NR}'\text{R}''$, $-\text{NR}''\text{C}(\text{O})\text{R}'$, $-\text{S}(\text{O})\text{R}'$, $-\text{SO}_2\text{R}'$, $-\text{SO}_2\text{NR}'\text{R}''$, $-\text{NR}''\text{SO}_2\text{R}$, $-\text{N}_3$, $-\text{CH}(\text{Ph})_2$, perfluoro (C_1-C_4) alkoxy and perfluoro (C_1-C_4) alkyl, where R' and R'' are as defined above. Further preferred substituents are selected from: halogen, $-\text{OR}'$, $-\text{OC}(\text{O})\text{R}'$, $-\text{NR}'\text{R}''$, $-\text{R}'$, $-\text{CN}$, $-\text{NO}_2$, $-\text{CO}_2\text{R}'$, $-\text{CONR}'\text{R}''$, $-\text{NR}''\text{C}(\text{O})\text{R}'$, $-\text{SO}_2\text{R}'$, $-\text{SO}_2\text{NR}'\text{R}''$, $-\text{NR}''\text{SO}_2\text{R}$, perfluoro (C_1-C_4) alkoxy and perfluoro (C_1-C_4) alkyl.

Two of the substituents on adjacent atoms of the aryl or heteroaryl ring may optionally be replaced with a substituent of the formula $-\text{T}-\text{C}(\text{O})-(\text{CH}_2)_q-\text{U}-$, wherein T and U are independently $-\text{NH}-$, $-\text{O}-$, $-\text{CH}_2-$ or a single bond, and q is an integer of from 0 to 2. Alternatively, two of the substituents on adjacent atoms of the aryl or heteroaryl ring may optionally be replaced with a substituent of the formula $-\text{A}-(\text{CH}_2)_r-\text{B}-$, wherein A and B are independently $-\text{CH}_2-$, $-\text{O}-$, $-\text{NH}-$, $-\text{S}-$, $-\text{S}(\text{O})-$, $-\text{S}(\text{O})_2-$, $-\text{S}(\text{O})_2\text{NR}'-$ or a single bond, and r is an integer of from 1 to 3. One of the single bonds of the new ring so formed may optionally be replaced with a double bond. Alternatively, two of the substituents on adjacent atoms of the aryl or heteroaryl ring may optionally be replaced with a substituent of the formula $-(\text{CH}_2)_s-\text{X}-$ $(\text{CH}_2)_t-$, where s and t are independently integers of from 0 to 3, and X is $-\text{O}-$, $-\text{NR}'-$, $-\text{S}-$, $-\text{S}(\text{O})-$, $-\text{S}(\text{O})_2-$, or $-\text{S}(\text{O})_2\text{NR}'-$. The substituent R' in $-\text{NR}'-$ and $-\text{S}(\text{O})_2\text{NR}'-$ is selected from hydrogen or unsubstituted (C_1-C_6) alkyl.

It is to be understood that the substituent $-\text{CO}_2\text{H}$, as used herein, includes bioisosteric replacements therefor, such as:

11

and the like. See, e.g., *The Practice of Medicinal Chemistry*; Wermuth, C. G., Ed.; Academic Press: New York, 1996; p. 203.

As used herein, the term “heteroatom” is meant to include oxygen (O), nitrogen (N), sulfur (S) and silicon (Si).

The term “pharmaceutically acceptable salts” is meant to include salts of the active compounds which are prepared with relatively nontoxic acids or bases, depending on the particular substituents found on the compounds described herein. When compounds of the present invention contain relatively acidic functionalities, base addition salts can be obtained by contacting the neutral form of such compounds with a sufficient amount of the desired base, either neat or in a suitable inert solvent. Examples of pharmaceutically acceptable base addition salts include sodium, potassium, calcium, ammonium, organic amino, or magnesium salt, or a similar salt. When compounds of the present invention contain relatively basic functionalities, acid addition salts can be obtained by contacting the neutral form of such compounds with a sufficient amount of the desired acid, either neat or in a suitable inert solvent. Examples of pharmaceutically acceptable acid addition salts include those derived from inorganic acids like hydrochloric, hydrobromic, nitric, carbonic, monohydrogencarbonic, phosphoric, monohydrogenphosphoric, dihydrogenphosphoric, sulfuric, monohydrogensulfuric, hydriodic, or phosphorous acids and the like, as well as the salts derived from relatively nontoxic organic acids like acetic, propionic, isobutyric, maleic, malonic, benzoic, succinic, suberic, fumaric, mandelic, phthalic, benzenesulfonic, p-tolylsulfonic, citric, tartaric, methanesulfonic, and the like. Also included are salts of amino acids such as arginate and the like, and salts of organic acids like glucuronic or galactunoric acids and the like (see, for example, Berge, S. M., et al, “Pharmaceutical Salts”, *Journal of Pharmaceutical Science*, 1977, 66, 1-19). Certain specific compounds of the present invention contain both basic and acidic functionalities that allow the compounds to be converted into either base or acid addition salts.

The neutral forms of the compounds may be regenerated by contacting the salt with a base or acid and isolating the parent compound in the conventional manner. The parent form of the compound differs from the various salt forms in certain physical properties, such as solubility in polar solvents, but otherwise the salts are equivalent to the parent form of the compound for the purposes of the present invention.

In addition to salt forms, the present invention provides compounds which are in a prodrug form. Prodrugs of the compounds described herein are those compounds that readily undergo chemical changes under physiological conditions to provide the compounds of the present invention. Additionally, prodrugs can be converted to the compounds

12

of the present invention by chemical or biochemical methods in an ex vivo environment. For example, prodrugs can be slowly converted to the compounds of the present invention when placed in a transdermal patch reservoir with a suitable enzyme or chemical reagent.

It is to be understood that when a compound of the invention contains one or more asymmetric carbon atoms (optical centers) or double bonds, the present invention includes individual stereoisomers and geometric isomers as well as mixtures thereof.

Certain compounds of the present invention can exist in unsolvated forms as well as solvated forms, including hydrated forms. In general, the solvated forms are equivalent to unsolvated forms and are intended to be encompassed within the scope of the present invention. Certain compounds of the present invention may exist in multiple crystalline or amorphous forms. In general, all physical forms are equivalent for the uses contemplated by the present invention and are intended to be within the scope of the present invention.

The compounds of the present invention may also contain unnatural proportions of atomic isotopes at one or more of the atoms that constitute such compounds. For example, the compounds may be radiolabeled with radioactive isotopes, such as for example tritium (^3H), iodine-125 (^{125}I) or carbon-14 (^{14}C). All isotopic variations of the compounds of the present invention, whether radioactive or not, are intended to be encompassed within the scope of the present invention.

Preparation of Compounds

Compounds of the present invention can be prepared beginning with commercially available starting materials and using general synthetic techniques known to those of skill in the art. Outlined below are reaction schemes suitable for preparing such compounds. Further exemplification is found in the specific Examples provided.

Scheme 1

17

-continued

As shown in Scheme 1, compounds of the present invention wherein R^5 Z^1 is H, can be prepared by reacting a suitably substituted pyridazinium salt (3) with an acetylene derivative (4). Condensation of 3 and 4 in an organic solvent or mixture of solvents (including aqueous mixtures) in the presence of a base (e.g., tetrabutyl ammonium fluoride) provides, after workup, pyrrolopyridazine 5. Pyridazinium salt 3 can, in turn, be obtained by treatment of a suitably substituted pyridazine (1) with an alkylating agent (2), wherein LG indicates a leaving group such as halide, toluenesulfonate, methanesulfonate or trifluoromethanesulfonate, in an organic solvent or mixture of solvents. Pyridazine 1 can be obtained by a variety of methods, as illustrated in Schemes 2-4.

In Scheme 2, a substituted or unsubstituted arylacetonitrile (6) is condensed with glyoxylic acid under basic conditions to provide the corresponding 3-aryl-3-cyanopropenoate 7. Subjecting 7 to acids such as HCl or H_2SO_4/HCO_2H results in the formation of maleic anhydride 8 (see, e.g., Dean et al. (1993) *J. Org. Chem.* 58:7916-7917). Treatment of 8 with hydrazine results in the formation of 4-arylpyridazine-3,6-diol 9, which can be converted into 4-aryl-3,6-dichloropyridazine 10 by treatment with a chlorinating reagent such as $POCl_3$, PCl_3 , PCl_5 or $SOCl_2$. Compound 10 can be treated with a nucleophile, e.g., an amine, to provide 11. Catalytic

hydrogenation of 11 using, for example, a palladium or platinum catalyst in a relatively polar solvent such as THF, methanol or an aqueous mixture containing an alcohol or THF as a co-solvent, for example, can be used to remove the halogen atom, producing 12. Scheme 3 illustrates similar methods that can be used to convert 10 into oxygen-substituted derivatives 14.

Scheme 3

19

20

As shown in Schemes 5-8, compounds such as diester **21** can be used to prepare compounds of the invention by, for example, hydrolysis of one or both ester groups to provide carboxylic acids such as **22** or **23** (Scheme 5). Ester hydrolysis can be accomplished in most solvents that will dissolve **21** and are at least partially miscible with water, by treating a solution of **21** with aqueous base such as lithium, sodium or potassium hydroxide.

Scheme 5

Other approaches can be used to obtain alkyl-substituted pyridazines, as depicted in Scheme 4. For example, 3,6-dichloropyridazine (**15**) can be alkylated in aqueous sulfuric acid with silver (I) peroxydisulfate in the presence of a carboxylic acid to afford alkylated dichloropyridazine **16** (see, e.g., Samaritoni (1988) *Org. Prep. Proced. Int.* 20:117). Transformation of **16** into the 3-amino-5-alkylpyridazine **18** can be accomplished as described above for the transformation of dichloropyridazine **10** into 3-amino-5-arylpyridazine **12**. Similarly, **16** can be converted into the ether derivative **20** as described above for the conversion of **10** into **14**.

Scheme 4

The carboxylic acid can, in turn, be converted into other groups by methods well known to those of ordinary skill in the art. Scheme 6 illustrates one method for the conversion of acid **22** to a carbamate (**25**). One of skill in the art will understand that other methods can be employed to prepare related compounds of the invention. For example, carboxylic acid **22** can be converted to amine **24** via a Curtius rearrangement (see, e.g., March, J. *Advanced Organic Chemistry*, 4th ed.; John Wiley & Sons: New York, 1992; pp 1091-1092). Treatment of **24** with a chloroformate in the presence of base (typically a tertiary amine) produces carbamate **25**.

22

Carboxylic acid **22** can be activated by condensation with a variety of coupling reagents, including hydroxybenzotriazole (HOBt) and N-hydroxysuccinimide (HOSu), for example, using dicyclohexylcarbodiimide (DCC) or a similar carbodiimide reagent, or a wide variety of reagents such as those developed for formation of peptide bonds. Conditions for such reactions are well known to those of ordinary skill in the art. The activated intermediate, an ester of HOBt or HOSu, for example, can be condensed with a wide variety of nucleophiles, for example, amines, alcohols and thiols, to produce other esters, thioesters or amides. Scheme 6 shows the conversion of acid **22** into amide **26** by this sequence, using ammonia as the nucleophile. Dehydration of amide **26** can be accomplished by a variety of methods. Phosphorous pentoxide is the most common dehydrating reagent for this reaction, but many others are known to those skilled in the art. Nitrile **27** can be converted into other groups such as a tetrazole (**28**) by methods well known to those of ordinary skill in the art. For example, reacting the nitrile with an azide, such as sodium or lithium azide, or hydrazoic acid in a solvent such as DMF or water will accomplish this transformation.

Scheme 6

23

Additional examples of the conversion of 22 into other compounds are shown in Scheme 7.

24

Transformation of 22 into acid chloride **29** can be accomplished using reagents such as oxalyl chloride, POCl_3 , PCl_3 , PCl_5 or SOCl_2 . Acid chloride **29** can be treated with, for example, a lithium dialkylcopper reagent to give ketone **30**. Acid chloride **29** can also be used to produce heterocyclic derivatives such as [1,3,4]-oxadiazoles (**31**), [1,2,4]-oxadiazoles (**32**) and oxazoles (**33**) using methods known to those of ordinary skill in the art. For example, reacting acid chloride **29** with an acyl hydrazide in the presence of a base such as triethylamine, followed by treatment with P_4O_{10} at elevated temperature will accomplish the transformation into **31**. In another example, **29** can be reacted with an N-hydroxyamidine derivative in the presence of a base, and the product treated with tetrabutyl ammonium fluoride to give **32**. In yet another example, **29** can be treated with an α -aminoketone in the presence of a base such as triethylamine or pyridine, and subsequently subjected to dehydrating conditions such as sulfuric acid, P_4O_{10} or PPh_3 -diethyl azodicarboxylate to produce **33**.

Still other compounds of this invention can be prepared from ester **21** as illustrated in Scheme 8. For example, reduction of 21 with a reagent such as LiAlH_4 or LiBEt_3H in a suitable solvent (e.g., THF, diethylether or dimethoxyethane) produces alcohol **34**. Alcohol **34** can be alkylated or acylated by methods known to the skilled practitioner to give **35** or **36**, respectively.

Compositions

In another aspect, the present invention provides pharmaceutical compositions for modulating DGAT activity in humans and animals that will typically contain a compound of formula I and a pharmaceutically acceptable carrier or diluent.

The pharmaceutical compositions for the administration of the compounds of this invention may conveniently be presented in unit dosage form and may be prepared by any of the methods well known in the art of pharmacy. All methods include the step of bringing the active ingredient into association with the carrier which constitutes one or more accessory ingredients. In general, the pharmaceutical compositions are prepared by uniformly and intimately bringing the active ingredient into association with a liquid carrier or a finely divided solid carrier or both, and then, if necessary, shaping the product into the desired formulation. In the pharmaceutical composition the active object compound is included in an amount sufficient to produce the desired effect upon the process or condition of diseases.

The pharmaceutical compositions containing the active ingredient may be in a form suitable for oral use, for example, as tablets, troches, lozenges, aqueous or oily suspensions, dispersible powders or granules, emulsions, hard or soft capsules, or syrups or elixirs. Compositions intended for oral use may be prepared according to any method known to the art for the manufacture of pharmaceutical compositions. Such compositions may contain one or more agents selected from sweetening agents, flavoring agents, coloring agents and preserving agents in order to provide pharmaceutically elegant and palatable preparations. Tablets contain the active ingredient in admixture with other non-toxic pharmaceutically acceptable excipients which are suitable for the manufacture of tablets. These excipients may be for example, inert diluents, such as calcium carbonate, sodium carbonate, lactose, calcium phosphate or sodium phosphate; granulating and disintegrating agents, for example, corn starch, or alginic acid; binding agents, for example starch, gelatin or acacia, and lubricating agents, for example magnesium stearate, stearic acid or talc. The tablets may be uncoated or they may be coated by known techniques to delay disintegration and absorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or glyceryl distearate may be employed. They may also be coated by the techniques described in the U.S. Pat. Nos. 4,256,108; 4,166,452; and 4,265,874 to form osmotic therapeutic tablets for control release.

Formulations for oral use may also be presented as hard gelatin capsules wherein the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules wherein the active ingredient is mixed with water or an oil medium, for example peanut oil, liquid paraffin, or olive oil.

Aqueous suspensions contain the active materials in admixture with excipients suitable for the manufacture of aqueous suspensions. Such excipients are suspending agents, for example sodium carboxymethylcellulose, methylcellulose, hydroxy-propylmethylcellulose, sodium alginate, polyvinyl-pyrrolidone, gum tragacanth and gum acacia; dispersing or wetting agents may be a naturally-occurring phosphatide, for example lecithin, or condensation products of an alkylene oxide with fatty acids, for example polyoxyethylene stearate, or condensation products of ethylene oxide with long chain aliphatic alcohols, for example heptadecaethyleneoxycetanol, or condensation

products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or condensation products of ethylene oxide with partial esters derived from fatty acids and hexitol anhydrides, for example polyethylene sorbitan monooleate. The aqueous suspensions may also contain one or more preservatives, for example ethyl, or n-propyl, p-hydroxybenzoate, one or more coloring agents, one or more flavoring agents, and one or more sweetening agents, such as sucrose or saccharin.

Oily suspensions may be formulated by suspending the active ingredient in a vegetable oil, for example arachis oil, olive oil, sesame oil or coconut oil, or in a mineral oil such as liquid paraffin. The oily suspensions may contain a thickening agent, for example beeswax, hard paraffin or cetyl alcohol. Sweetening agents such as those set forth above, and flavoring agents may be added to provide a palatable oral preparation. These compositions may be preserved by the addition of an anti-oxidant such as ascorbic acid.

Dispersible powders and granules suitable for preparation of an aqueous suspension by the addition of water provide the active ingredient in admixture with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned above. Additional excipients, for example sweetening, flavoring and coloring agents, may also be present.

The pharmaceutical compositions of the invention may also be in the form of oil-in-water emulsions. The oily phase may be a vegetable oil, for example olive oil or arachis oil, or a mineral oil, for example liquid paraffin or mixtures of these. Suitable emulsifying agents may be naturally-occurring gums, for example gum acacia or gum tragacanth, naturally-occurring phosphatides, for example soy bean, lecithin, and esters or partial esters derived from fatty acids and hexitol anhydrides, for example sorbitan monooleate, and condensation products of the said partial esters with ethylene oxide, for example polyoxyethylene sorbitan monooleate. The emulsions may also contain sweetening and flavoring agents.

Syrups and elixirs may be formulated with sweetening agents, for example glycerol, propylene glycol, sorbitol or sucrose. Such formulations may also contain a demulcent, a preservative and flavoring and coloring agents.

The pharmaceutical compositions may be in the form of a sterile injectable aqueous or oleagenous suspension. This suspension may be formulated according to the known art using those suitable dispersing or wetting agents and suspending agents which have been mentioned above. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example as a solution in 1,3-butane diol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of injectables.

The compounds of the present invention may also be administered in the form of suppositories for rectal administration of the drug. These compositions can be prepared by mixing the drug with a suitable non-irritating excipient which is solid at ordinary temperatures but liquid at the

rectal temperature and will therefore melt in the rectum to release the drug. Such materials are cocoa butter and polyethylene glycols.

For topical use, patches, creams, ointments, jellies, solutions or suspensions, etc., containing the compounds of the present invention are employed. As used herein, topical application is also meant to include the use of mouth washes and gargles.

The pharmaceutical composition and method of the present invention may further comprise other therapeutically active compounds as noted herein which are usually applied in the treatment of the above-mentioned pathological conditions.

In yet another aspect, the present invention provides methods of using a compound or composition of the invention to treat or prevent a disease or condition associated with DGAT. Diseases and conditions associated with lipid metabolism and cell proliferation, and complications thereof, can be treated with the subject compounds and compositions. In one group of embodiments, diseases and conditions, including chronic diseases, of humans or other species that can be treated with inhibitors of DGAT function include, but are not limited to, metabolic disorders, such as obesity, diabetes, anorexia nervosa, bulimia, cachexia, syndrome X, insulin resistance, hypoglycemia, hyperglycemia, hyperuricemia, hyperinsulinemia, hypercholesterolemia, hyperlipidemia, dyslipidemia, mixed dyslipidemia, hypertriglyceridemia and nonalcoholic fatty liver disease; cardiovascular diseases, such as atherosclerosis, arteriosclerosis, acute heart failure, congestive heart failure, coronary artery disease, cardiomyopathy, myocardial infarction, angina pectoris, hypertension, hypotension, stroke, ischemia, ischemic reperfusion injury, aneurysm, restenosis and vascular stenosis; neoplastic diseases, such as solid tumors, skin cancer, melanoma, lymphoma and endothelial cancers, e.g., breast cancer, lung cancer, colorectal cancer, stomach cancer, other cancers of the gastrointestinal tract (e.g., esophageal cancer and pancreatic cancer), prostate cancer, kidney cancer, liver cancer, bladder cancer, cervical cancer, uterine cancer, testicular cancer and ovarian cancer; skin disorders typically associated with sebaceous glands such as acne (including open comedos and whiteheads), deep acne, acne conglobata, acne rosacea, comedos, cysts, microcomedos, acne vulgaris, rosacea, perioral dermatitis, sebaceous cysts, primary seborrhea, secondary seborrhea, and alopecia; and other diseases and conditions that are sensitive or responsive to modulation of DGAT function.

The methods of the present invention typically involve administering to a subject in need of therapeutic treatment, an effective amount of a compound of formula (I). The dose, frequency and timing of such administering will depend in large part on the selected therapeutic agent, the nature of the condition being treated, the condition of the subject including age, weight and presence of other conditions or disorders, the formulation being administered and the discretion of the attending physician. Preferably, the compositions and compounds of the invention and the pharmaceutically acceptable salts thereof are administered via oral, parenteral or topical routes. Generally, the compounds are administered in dosages ranging from about 2 mg up to about 2,000 mg per day, although variations will necessarily occur depending, as noted above, on the disease target, the patient, and the route of administration. Preferred dosages are administered orally in the range of about 0.05 mg/kg to about 20 mg/kg, more preferably in the range of about 0.05 mg/kg to about 2 mg/kg, most preferably in the range of about 0.05 mg/kg

to about 0.2 mg per kg of body weight per day. The dosage employed for the topical administration will, of course, depend on the size of the area being treated.

Combination Therapy with Additional Active Agents

The present invention further provides methods of using a compound or composition of the invention in combination with one or more additional active agents, depending on the desired target therapy (see, e.g., Turner, N. et al. *Prog. Drug Res.* (1998) 51: 33-94; Haffner, S. *Diabetes Care* (1998) 21: 160-178; and DeFronzo, R. et al. (eds.), *Diabetes Reviews* (1997) Vol. 5 No. 4). A number of studies have investigated the benefits of combination therapies with oral agents (see, e.g., Mahler, R., *J. Clin. Endocrinol. Metab.* (1999) 84: 1165-71; United Kingdom Prospective Diabetes Study Group: UKPDS 28, *Diabetes Care* (1998) 21: 87-92; Bardin, C. W., (ed.), *CURRENT THERAPY IN ENDOCRINOLOGY AND METABOLISM*, 6th Edition (Mosby—Year Book, Inc., St. Louis, Mo. 1997); Chiasson, J. et al., *Ann. Intern. Med.* (1994) 121: 928-935; Coniff, R. et al., *Clin. Ther.* (1997) 19: 16-26; Coniff, R. et al., *Am. J. Med.* (1995) 98: 443-451; and Iwamoto, Y. et al., *Diabet. Med.* (1996) 13: 365-370; Kwiterovich, P. *Am. J. Cardiol* (1998) 82 (12A): 3U-17U).

In particular, the studies provided above indicate that diabetes and hyperlipidemia modulation can be further improved in many instances by the addition of a second agent to the therapeutic regimen. Combination therapy includes administration of a single pharmaceutical dosage formulation which contains a compound having the general structure of formula I and one or more additional active agents, as well as administration of a compound of formula I and each active agent in its own separate pharmaceutical dosage formulation. For example, a compound of formula I and an HMG-CoA reductase inhibitor can be administered to the human subject together in a single oral dosage composition, such as a tablet or capsule, or each agent can be administered in separate oral dosage formulations. Where separate dosage formulations are used, a compound of formula I and one or more additional active agents can be administered at essentially the same time (i.e., concurrently), or at separately staggered times (i.e., sequentially). Combination therapy is understood to include all these regimens.

An example of combination therapy that modulates (prevents the onset of the symptoms or complications associated with) atherosclerosis involves administering a compound of formula I in combination with one or more of the following active agents: an antihyperlipidemic agent; a plasma HDL-raising agent; an antihypercholesterolemic agent, such as a cholesterol biosynthesis inhibitor, e.g., an hydroxymethylglutaryl (HMG) CoA reductase inhibitor (also referred to as statins, such as lovastatin, simvastatin, pravastatin, fluvastatin, and atorvastatin), an HMG-CoA synthase inhibitor, a squalene epoxidase inhibitor, or a squalene synthetase inhibitor (also known as squalene synthase inhibitor); an acyl-coenzyme A cholesterol acyltransferase (ACAT) inhibitor, such as melinamide; probucol; nicotinic acid and the salts thereof and niacinamide; a cholesterol absorption inhibitor, such as β -sitosterol; a bile acid sequestrant anion exchange resin, such as cholestyramine, colestipol or dialkylaminoalkyl derivatives of a cross-linked dextran; an LDL (low density lipoprotein) receptor inducer; fibrates, such as clofibrate, bezafibrate, fenofibrate, and gemfibrozil; vitamin B₆ (also known as pyridoxine) and pharmaceutically acceptable salts thereof, such as the HCl salt; vitamin B₁₂ (also known as cyanocobalamin); vitamin B₃ (also known as nicotinic acid and niacinamide, supra); anti-oxidant vitamins, such as vitamin C and E and beta carotene; a beta-blocker; an angiotensin II antagonist; an angiotensin con-

verting enzyme inhibitor; and a platelet aggregation inhibitor, such as fibrinogen receptor antagonists (i.e., glycoprotein IIb/IIIa fibrinogen receptor antagonists) and aspirin. As noted above, the compounds of formula I can be administered in combination with more than one additional active agent, for example, a combination of a compound of formula I with an HMG-CoA reductase inhibitor (e.g., lovastatin, simvastatin and pravastatin) and aspirin, or a compound of formula I with an HMG-CoA reductase inhibitor and a β blocker.

Another example of combination therapy can be seen in treating obesity or obesity-related disorders, wherein the compounds of formula I can be effectively used in combination with, for example, phenylpropanolamine, phentermine, diethylpropion, mazindol; fenfluramine, dexfenfluramine, phentiramine, β_3 adrenoceptor agonist agents; sibutramine, gastrointestinal lipase inhibitors (such as orlistat), and leptins. Other agents used in treating obesity or obesity-related disorders can be used in combination with compounds of formula I including, for example, neuropeptide Y, enterostatin, cholecystokinin, bombesin, amylin, histamine H_3 receptors, dopamine D_2 receptors, melanocyte stimulating hormone, corticotrophin releasing factor, galanin and gamma amino butyric acid (GABA).

Another example of combination therapy can be seen in modulating diabetes (or treating diabetes and its related symptoms, complications, and disorders), wherein the compounds of formula I can be effectively used in combination with, for example, sulfonylureas (such as chlorpropamide, tolbutamide, acetohexamide, tolazamide, glyburide, glimepiride, glipizide), biguanides (such as metformin), thiazolidinediones (such as ciglitazone, pioglitazone, troglitazone, and rosiglitazone); dehydroepiandrosterone (also referred to as DHEA or its conjugated sulphate ester, DHEA- SO_4); antigluco-corticoids; TNF α inhibitors; α -glucosidase inhibitors (such as acarbose, miglitol, and voglibose), pramlintide (a synthetic analog of the human hormone amylin), other insulin secretagogues (such as repaglinide, gliquidone, and nateglinide), insulin, as well as the active agents discussed above for treating atherosclerosis.

Still another example of combination therapy can be seen in modulating hyperlipidemia (treating hyperlipidemia and its related complications), wherein the compounds of formula I can be effectively used in combination with, for example, statins (such as fluvastatin, lovastatin, pravastatin or simvastatin), bile acid-binding resins (such as colestipol or cholestyramine), nicotinic acid, probucol, betacarotene, vitamin E, or vitamin C.

In accordance with the present invention, a therapeutically effective amount of a compound of formula I can be used for the preparation of a pharmaceutical composition useful for treating diabetes, treating hyperlipidemia, treating hyperuricemia, treating obesity, lowering triglyceride levels, lowering cholesterol levels, raising the plasma level of high density lipoprotein, and for treating, preventing or reducing the risk of developing atherosclerosis.

A further example of combination therapy can be seen in modulating dermatological conditions, wherein compounds of formula I can be effectively used in combination with, for example, acne treatments (e.g., isotretinoin, doxycycline,

tetracycline, salicylate) and seborrheic dermatitis treatments (antifungal agents such as climbazole, ketoconazole). Moreover, compounds of formula I can be effectively used to enhance the transdermal delivery of drugs applied topically in the form of a patch, lotion, jellies, cream, etc.

Still another example of combination therapy can be seen in treating nonalcoholic fatty liver disease (NAFLD), wherein compounds of formula I can be effectively used in combination with hepatoprotective agents such as ursodeoxycholic acid and betaine.

Additionally, an effective amount of a compound of formula I and a therapeutically effective amount of one or more active agents selected from the group consisting of: an antihyperlipidemic agent; a plasma HDL-raising agent; an antihypercholesterolemic agent, such as a cholesterol biosynthesis inhibitor, for example, an HMG-CoA reductase inhibitor, an HMG-CoA synthase inhibitor, a squalene epoxidase inhibitor, or a squalene synthetase inhibitor (also known as squalene synthase inhibitor); an acyl-coenzyme A cholesterol acyltransferase inhibitor; probucol; nicotinic acid and the salts thereof; niacinamide; a cholesterol absorption inhibitor; a bile acid sequestrant anion exchange resin; a low density lipoprotein receptor inducer; clofibrate, fenofibrate, and gemfibrozil; vitamin B₆ and the pharmaceutically acceptable salts thereof; vitamin B₁₂; an anti-oxidant vitamin; a β -blocker; an angiotensin II antagonist; an angiotensin converting enzyme inhibitor; a platelet aggregation inhibitor; a fibrinogen receptor antagonist; aspirin; phenteramines, β_3 adrenergic receptor agonists; sulfonylureas, biguanides, α -glucosidase inhibitors, other insulin secretagogues, insulin and a hepatoprotective agent can be used together for the preparation of a pharmaceutical composition useful for the above-described treatments.

Example 105

This example describes assays that may be used to identify compounds having DGAT activity.

Numerous in vitro assay systems may be used to determine the modulation of DGAT activity. Examples of such assay systems utilize insect cell over-expression systems, tissue microsome preparations and cell culture. In the insect cell over-expression and tissue microsome preparation assay systems, the system itself provides the enzyme source for activity measurements. Such measurements are generally conducted using radiolabeled substrate, wherein the radiolabeled product that is generated is subsequently resolved by thin layer chromatography (TLC) (see, e.g., Cases, et al., *Proc. Natl. Acad. Sci.* (1998) 95:13018 and Cases, et al., *J. Biol. Chem.* (2001) 276:38870).

By comparison, cell culture-based assay systems measure intracellular synthesis of triglyceride by incubating living cells with radiolabeled fatty acid. The radiolabeled fatty acid is utilized in triglyceride biosynthesis. Triglycerides can then be extracted from the cells using organic solvent and resolved by thin layer chromatography to determine the level of radiolabel incorporation as a measure of enzyme activity (see e.g., Cases, et al., *J. Biol. Chem.* (2001) 276:38870).

Cell-Based Assays

In a preferred cellular assay, human colon tumor CaCO₂, human hepatoma HepG2, or mouse adipocyte 3T3-L1 cells (undifferentiated or differentiated as described below) are

90

cultured to confluency in 24 well plates. The medium is replaced with serum-free medium and the cells incubated for a further 24-48 h. Next, medium is replaced with serum-free medium containing 400 μM oleic acid (complexed with BSA, 2:1 mole:mole) and compound at varying doses in a final volume of 200 μL per well. Cells are incubated for 30 min. before adding 0.1 μCi of ¹⁴C oleic acid directly to the cells and the incubation continued for 10-30 min. depending on the cell type. Cells are washed two times with 1 mL PBS and air dried at 37° C. for 10 min. Cell lipids are extracted with 0.5 mL hexane:isopropyl alcohol (3:2 v/v) for 5 min. twice. Lipid extracts are evaporated to dryness and used for TLC using hexane:ethyl ether:acetic acid (80:20:1 v/v) as solvent. The radioactive bands are visualized and quantified by exposure to X-ray film or phosphorimager screen.

3T3-L1 cell differentiation into adipocytes is induced by incubating confluent cells in medium containing 10% serum, insulin (10 μg/mL), dexamethasone (1 μM), isobutylmethyl xanthine (IBMX, 0.5 mM), and tri-iodothyronine (T3, 10 nM). After 2 days, cells are maintained in serum, insulin, T3, and BRL49653 (1 μM) containing medium for 4-10 days.

Biochemical Assays

A preferred assay that may be used for identifying DGAT inhibitors involves a high throughput screening Scintillation Proximity Assay (SPA). In such an assay human DGAT1 is cloned from a human liver cDNA library. PCR is used to add a restriction site and flag epitope at the most 5' end and a restriction site at the 3' end of the sequence. Thereafter, human flagtag (FT) DGAT1 baculovirus may be generated using a Bac-to-Bac Baculovirus Expression System® (Invitrogen). Insect cells (e.g., sf9, sf21, or High Five) are infected for 24 to 72 h and collected by centrifugation. Cell pellets are resuspended in homogenization buffer and lysed using a homogenization device, such as a Microfluidizer. Total cell membranes are collected by ultracentrifugation at 45,000 rpm for 1 h.

A small aliquot (0.2 μg/well) of membrane is incubated with 10 μM compound or mercuric chloride (as positive control for inhibition) in the presence of enzyme substrate, dioleoyl glycerol (200 μM) in 384 well plates, final volume 50 μL per well. The reaction is started by the addition of radioactive substrate, ¹⁴C acyl coenzyme A (25 μM, such as decanoyl CoA, palmitoyl CoA, oleoyl CoA), and incubated at room temperature for 2 h. The reaction is stopped by adding Wheat Germ Agglutinin (WGA) SPA beads (0.2 mg) in mercuric chloride. Cell membranes are allowed to couple to the beads overnight. The signal can be measured using, for example, a Chemiluminescence Image Plate Reader (CLIPR) or TopCount device.

Compounds of the present invention assessed by the above-described assay were found to have DGAT-inhibiting activity. See Table 1 below.
