(57) **ABSTRACT**

A stent graft (1) including a tubular wall (3) with at least one fenestration (40) including a peripheral (37) reinforcement around at least part of the fenestration. There can also be a tubular extension (15). The side arm includes a stent (19) and a cover (17) and extends from and is in fluid communication with the fenestration and the stent graft. The stent may be a self expanding stent. The ring and/or tubular extension provides better support and sealing for an extension arm. The fenestration (40) can be circular or if towards the ends of the stent graft may be in the form of a U-shape (50) with an open end.

**FENESTRATED STENT GRAFTS****CROSS-REFERENCE TO RELATED APPLICATIONS**

This application claims priority of provisional applications Ser. No. 60/510,241 filed Oct. 10, 2003 and Ser. No. 60/529,346 filed Dec. 12, 2003.

**TECHNICAL FIELD**

This invention relates to a stent graft adapted for endovascular deployment and in particular to a fenestrated stent graft.

**BACKGROUND OF THE INVENTION**

In our earlier patent application published as WO 99/29262 there was disclosed a stent graft including at least one fenestration to enable an extension leg graft to be extended from a main stent graft in an internal lumen through the fenestration to have the extension leg or arm graft extend into a branch vessel of the lumen. Such a situation may exist in the aorta with renal arteries extending from the aorta. When there is an aneurysm in this region which includes the junction of the aorta with the renal arteries then it is desirable to not only have a main graft which spans the aneurysm but also extension legs or arms which extend from the main graft into the renal or other arteries.

A simple fenestration does not necessarily give a fully reliable support and sealing surface for the extension leg graft and it is the object of this invention to improve the ability for support and sealing of an extension leg or arm grafts into a main graft.

**SUMMARY OF THE INVENTION**

In one form, therefore, the invention is said to reside in a stent graft having a tubular wall and at least one fenestration in the tubular wall, the or each fenestration including a resilient material around at least a portion of the periphery thereof to provide dimensional stability to the fenestration.

Preferably the resilient material may be selected from nitinol, stainless steel or elastomeric material and may be in the form of a spring, expandable ring such as a slip ring or a portion of resilient wire.

In one form the resilient material around the periphery may be in the form of a ring.

Preferably the ring includes at least two turns of wire and preferably the terminal ends of the wire of the ring are provided with a loop so that the wire does not present a pointed end of wire which could damage a vessel.

Alternatively, the ring may be a ring of a resilient material such as an elastomer. The elastomer may for instance be silicone elastomer.

Where the fenestration is adjacent an end of the stent graft the fenestration may be in the form of a scallop which is open at one side. The resilient material around the periphery may be in the form of a U-shape and during deployment may assist with opening up of the fenestration so that a vessel behind the fenestration can be catheterized.

In another embodiment of a fenestration in the form of a scallop provided at the distal or proximal end of the stent graft, it may have struts of self expanding stents acting as resilient peripheral reinforcement around a portion of the fenestration. When the stent expands upon deployment, the struts spread apart thereby opening up the fenestration.

The scallop may be at the proximal or distal end of a stent graft. For instance, when deploying a stent graft extending from the thoracic arch, a fenestration may be provided to prevent the coeliac artery being occluded. As with all embodiments, radiopaque or MRI opaque markers may be used to define the periphery of the fenestration.

When deploying a stent graft into the lower aorta in the region of the aortic bifurcation, it may be desirable to provide a scalloped fenestration at the proximal end of the stent graft to avoid occluding the renal arteries or the superior mesenteric artery. Where these arteries are close together the scalloped fenestration may be of such a size that it extends over more than one of the openings to the arteries.

The U-shape of resilient material can be a nitinol or a stainless steel wire or may be a portion of an elastomeric material such as a silicone elastomer.

The fenestration may be surrounded by radiopaque markers to assist with visualisation by suitable radiographic techniques. Alternatively there may be included in or associated with the resilient material a gold or other heavy metal wire or band to provide the necessary visualisation.

In one embodiment the fenestration may include a tubular extension between the tubular wall and the ring.

The tubular extension may include a self expanding stent and an associated lining or covering of a biocompatible graft material.

In an alternative form the invention is said to reside in a stent graft having at least one fenestration, the fenestration including a tubular extension, the side arm including a stent and extending from and in fluid communication with the fenestration and the tubular wall.

Preferably the tubular extension includes an associated lining or covering of a biocompatible graft material. By this arrangement the inner cylindrical surface of the tubular extension provides a larger support and sealing surface between the fenestration in the main graft and an outer cylindrical surface of a side branch stent graft which has been deployed through the fenestration.

Preferably the stent in the tubular extension is a self expanding stent which may be Nitinol™ or stainless steel. Alternatively the stent in the tubular extension may be a balloon expandable stent.

In one form the stent may be in the form of a well-known Gianturco style zig zag Z stent. Alternatively the stent may be a nitinol self expanding stent of the type known as a ZILVER™ stent sold by Cook Incorporated, Bloomington, Ind.

The bio-compatible graft material may be either on the inside or the outside of the stent or there may be a cover which extends over both the inside and the outside of the stent on the tubular extension.

There may be further included a ring of a resilient material around the periphery at the terminal end of the tubular extension to provide dimensional stability to the tubular extension to assist with sealing. The ring may be formed from one or more and preferably two or more circular turns of nitinol or stainless steel wire and preferably have a loop at each of its ends to prevent the wire from presenting a sharp end which might protrude through the graft material and pierce a lumen wall.

The bio-compatible material may be dacron, Thoralon™, expanded polytetrafluoroethylene or other synthetic biocompatible material.

While Dacron, expanded polytetrafluoroethylene (ePTFE), or other synthetic biocompatible materials can be used to fabricate the coverings for the stent graft and the tubular extension, a naturally occurring biomaterial, such as collagen, is highly desirable, particularly a specially derived

collagen material known as an extracellular matrix (ECM) material, such as small intestinal submucosa (SIS) commercially available from Cook Biotech, West Lafayette, Ind. Besides SIS, examples of ECM's include pericardium, stomach submucosa, liver basement membrane, urinary bladder submucosa, tissue mucosa, and dura mater.

SIS is particularly useful, and can be made in the fashion described in Badylak et al., U.S. Pat. No. 4,902,508; Intestinal Collagen Layer described in U.S. Pat. No. 5,733,337 to Carr and in 17 Nature Biotechnology 1083 (November 1999); Cook et al., WIPO Publication WO 98/22158, dated 28 May 1998, which is the published application of PCT/US97/14855. Irrespective of the origin of the material (synthetic versus naturally occurring), the material can be made thicker by making multilaminate constructs, for example SIS constructs as described in U.S. Pat. Nos. 5,968,096; 5,955,110; 5,885,619; and 5,711,969. Animal data show that the SIS used in grafts can be replaced by native tissue in as little as a month's time. In addition to xenogenic biomaterials, such as SIS, autologous tissue can be harvested as well. Additionally Elastin or Elastin-Like Polypeptides (ELPs) and the like offer potential as a material to fabricate the graft to form a device with exceptional biocompatibility. Another alternative would be to use allografts such as harvested native tissue. Such tissue is commercially available in a cryopreserved state.

The tubular extension may be placed on a reduced diameter portion of the stent graft so that the overall diameter of the stent graft is not significantly affected.

For this specification the term 'tubular extension' in relation to the side arm, is intended to mean that the length of the tubular extension is substantially similar in order of magnitude to the diameter of the tubular extension. Hence for a tubular extension diameter of 6 millimetres the length may be in the range of 5 to 10 millimetres. Such a tubular extension diameter would be suitable for deploying an extension leg or arm graft for a renal artery extending from an aorta.

The stent graft may have a diameter of from 20 to 40 mm and a length of from 100 to 250 mm. The placement of the fenestrations and the tubular extensions where required is dependant upon the particular body lumen and each set of fenestrations would normally be custom designed. The main stent graft may include a proximally extending uncovered stent to assist with retention within a body lumen such as an aorta.

The main stent graft in which the fenestration is provided may be one of the components of a composite graft.

U.S. Pat. No. 5,387,235 entitled "Expandable Transluminal Graft Prosthesis For Repair Of Aneurysm" discloses apparatus and methods of retaining grafts onto deployment devices. These features and other features disclosed in U.S. Pat. No. 5,387,235 could be used with the present invention and the disclosure of U.S. Pat. No. 5,387,235 is herewith incorporated in its entirety into this specification.

U.S. Pat. No. 5,720,776 entitled "Barb and Expandable Transluminal Graft Prosthesis For Repair of Aneurysm" discloses improved barbs with various forms of mechanical attachment to a stent. These features and other features disclosed in U.S. Pat. No. 5,720,776 could be used with the present invention and the disclosure of U.S. Pat. No. 5,720,776 is herewith incorporated in its entirety into this specification.

U.S. Pat. No. 6,206,931 entitled "Graft Prosthesis Materials" discloses graft prosthesis materials and a method for implanting, transplanting replacing and repairing a part of a patient and particularly the manufacture and use of a purified, collagen based matrix structure removed from a submucosa tissue source. These features and other features disclosed in

U.S. Pat. No. 6,206,931 could be used with the present invention and the disclosure of U.S. Pat. No. 6,206,931 is herewith incorporated in its entirety into this specification.

PCT Patent Publication No. WO 98/53761 entitled "A Prosthesis And A Method And Means Of Deploying A Prosthesis" discloses an introducer for a prosthesis which retains the prosthesis so that each end can be moved independently. These features and other features disclosed in PCT Patent Publication No. WO 98/53761 could be used with the present invention and the disclosure of PCT Patent Publication No. WO 98/53761 is herewith incorporated in its entirety into this specification.

U.S. Pat. No. 6,524,335 and PCT Patent Publication No. WO 99/29262 entitled "Endoluminal Aortic Stents" disclose a fenestrated prosthesis for placement where there are intersecting arteries. This feature and other features disclosed in U.S. Pat. No. 6,524,335 and PCT Patent Publication No. WO 99/29262 could be used with the present invention and the disclosure of U.S. Pat. No. 6,524,335 and PCT Patent Publication No. WO 99/29262 is herewith incorporated in its entirety into this specification.

U.S. patent application Ser. No. 10/280,486, filed Oct. 25, 2002 and published on May 8, 2003 as U.S. Patent Application Publication No. US-2003-0088305-A1 and PCT Patent Publication No. WO 03/034948 entitled "Prostheses For Curved Lumens" discloses prostheses with arrangements for bending the prosthesis for placement into curved lumens. This feature and other features disclosed in U.S. patent application Ser. No. 10/280,486, and U.S. Patent Application Publication No. US-2003-0088305-A1 and PCT Patent Publication No. WO 03/034948 could be used with the present invention and the disclosure of U.S. patent application Ser. No. 10/280,486, and U.S. Patent Application Publication No. US-2003-0088305-A1 and PCT Patent Publication No. WO 03/034948 is herewith incorporated in its entirety into this specification.

U.S. Provisional Patent Application Ser. No. 60/392,682, filed Jun. 28, 2002, U.S. patent application Ser. No. 10/447,406, filed May 29, 2003, and Published on Dec. 18, 2003, as U.S. Patent Application Publication No. US-2003-0233140-A1, and PCT Patent Publication No. WO 03/101518 entitled "Trigger Wires" disclose release wire systems for the release of stent grafts retained on introducer devices. This feature and other features disclosed in U.S. Provisional Patent Application Ser. No. 60/392,682, U.S. patent application Ser. No. 10/447,406, and U.S. Patent Application Publication No. US-2003-0233140-A1, and PCT Patent Publication No. WO 03/101518 could be used with the present invention and the disclosure of U.S. Provisional Patent Application Ser. No. 60/392,682, U.S. patent application Ser. No. 10/447,406, and U.S. Patent Application Publication No. US-2003-0233140-A1, and PCT Patent Publication No. WO 03/101518 is herewith incorporated in its entirety into this specification.

U.S. Provisional Patent Application Ser. No. 60/392,667, filed Jun. 28, 2002, and U.S. patent application Ser. #### BRIEF DESCRIPTION OF THE DRAWING

This then generally describes the invention but to assist with understanding reference will now be made to the accompanying drawings which show a preferred embodiment of the invention.

In the drawings:

FIG. 1 shows one embodiment of a stent graft according to this invention;

FIG. 2 shows a cross section of the stent graft shown in FIG. 1 along the line 2-2';

FIG. 3 shows a cross section through a tubular extension in one embodiment of the invention;

FIG. 4 shows a part cut away view of the embodiment shown in FIG. 3;

FIG. 5 shows an alternative embodiment of a stent graft according to this invention;

FIG. 6 shows a cross section through a fenestration shown in FIG. 5;

FIG. 7 shows a part cut away view of a fenestration of the embodiment shown in FIG. 5;

FIG. 8 shows a detailed view of the inside of a scalloped fenestration according to one embodiment of the invention;

FIG. 9 shows an inside view of the embodiments shown in FIG. 8;

FIG. 10 shows an alternative embodiment of fenestration with a resilient elastomer ring surrounding the periphery of the fenestration;

FIG. 11 shows another view of the embodiment of FIG. 10;

FIG. 12 shows an alternative embodiment of a stent graft with a scalloped fenestration;

FIG. 13 shows a detailed internal view of the scalloped fenestration of FIG. 12;

FIG. 13A shows an internal view of an alternative arrangement of a scalloped fenestration;

FIG. 14 shows an alternative embodiment of a stent graft with a scalloped fenestration; and

FIG. 15 shows a detailed internal view of the scalloped fenestration of FIG. 14.

#### DETAILED DESCRIPTION

Now looking more closely at the drawings and in particular the embodiment shown in FIGS. 1 and 2 it will be seen that a main stent graft 1 comprises a tubular wall body portion 3 at proximal and distal ends of the stent graft 1 with a central reduced diameter portion 5 between the ends of the stent graft with tapered portions 6 and 7 extending from the tubular wall body portions 3 at each end to the central reduced diameter portion 5.

All of the tubular wall body portions, the tapered portions and the central portion are a biocompatible graft material such as Dacron, Thoralon™, expanded PTFE material or a naturally occurring biomaterial, such as an extracellular matrix, such as small intestinal submucosa or other suitable material or a combination of these materials.

Gianturco style zig zag Z stents **9** are provided inside the graft material of the tubular body portions **3** at each end and in between the ends Gianturco zig zag style Z stents **11** are provided on the tapering portions **6** and **7** and on the reduced diameter portion **5** outside of the graft material. There may be further Gianturco style zig zag Z stents on each of the tubular wall body portions **3**, the tapering portions **6** and **7** and the reduced diameter portion **5** depending upon the overall length of the stent graft **1**.

In the reduced diameter central portion **5** there is at least one substantially circular fenestration or aperture **13** on the tubular wall of the stent graft. In this embodiment there are three fenestrations being one for each of the two renal arteries and one for the superior mesenteric artery. Other numbers of fenestrations may also be used. The fenestrations **13** are substantially circular and extending from the fenestrations are tubular extensions **15**. The tubular extensions **15** comprise a bio-compatible material tube **17** with a self expanding stent **19**. In this embodiment the self expanding stent **19** is provided on the outer surface of the tubular extension but in an alternative embodiment the self expanding stent **19** may be provided on the inner surface of the graft material **17**.

The biocompatible material tube **15** is a biocompatible graft material such as Dacron, Thoralon™, expanded PTFE material or a naturally occurring biomaterial, such as an extracellular matrix, such as small intestinal submucosa or other suitable material as previously identified.

Stitching **21** is provided to retain the tubular extension to the main graft.

Radiopaque markers **23** are provided at each end of the fenestration **13** at the base of the tubular extension **15** to assist a physician to locate the fenestration in respect to a side vessel extending from a main vessel. The radiopaque markers **23** may be gold or other convenient material.

In the embodiment shown in FIGS. **3** and **4** the tubular extension generally shown as **30** extends from a fenestration or aperture **31** in the side wall of a main stent graft **32**. The tubular extension **30** includes a self expanding nitinol stent **34** with a bio-compatible graft material inner layer **35** and outer layer **36**. A ring **37** of nitinol around the periphery of the tubular extension at the terminal end **39** is provided to give good dimensional stability to the distal end of the tubular extension **30**. In an alternative arrangement the ring **37** may be formed from stainless steel or any other convenient material. Stitching **41** is provided to retain the tubular extension to the main graft and stitching **42** is used to retain the ring **37** at the terminal end **39** of the tubular extension **30**.

The ring **37** of nitinol comprises two turns of wire with a loop **38** at each end of the wire. The loops **38** are provided to prevent the chance of damage to lumen wall because the pointed end of the wire is effectively enclosed within the loop.

It will be seen that by these various embodiments of this form of the invention that the tubular extension provides a good support and sealing surface into which another biocompatible material stent graft may be deployed to extend into a branch artery from a main artery or other lumen of the body.

FIGS. **5** to **7** show an alternative embodiment of a stent graft according to this invention. In this embodiment the same reference numerals as used in FIG. **1** are used for corresponding components.

A main stent graft **1** comprises a tubular wall body portion **3** at proximal and distal ends of the stent graft **1** with a central tubular wall body portion **5**.

All of the tubular wall body portions are a biocompatible graft material such as Dacron, Thoralon™, expanded PTFE material or a naturally occurring biomaterial, such as an extracellular matrix, such as small intestinal submucosa or other suitable material.

Gianturco style zig zag Z stents **9** are provided inside the graft material of the tubular wall body portions **3** at each end and on the central tubular wall body portion **5** Gianturco style zig zag Z stents **11** are provided on the outside of the graft material. There may be further Gianturco style zig zag Z stents on each of the tubular wall body portions **3** and the central tubular wall portion **5** than those illustrated depending upon the overall length of the stent graft **1**.

In the central tubular wall body portion **5** there is at least one substantially circular fenestration or aperture **40** on the tubular wall of the stent graft. In this embodiment there are two fenestrations being one for each of the two renal arteries when this embodiment is deployed into the aorta. Other numbers of fenestrations may also be used where the placement of the stent graft involves the possibility of occluding other branch vessels such as the superior mesenteric artery. The fenestrations **40** are substantially circular. Radiopaque markers **23** are provided at each end of the fenestration **40** to assist a physician to locate the fenestration **40** in respect to a side vessel extending from a main vessel. The radiopaque markers **23** may be gold or other convenient material.

A ring **45** of nitinol as can particularly be seen in FIGS. **6** and **7** is provided around the periphery of the fenestration **40** to give good dimensional stability to the fenestration **40**. In an alternative arrangement the ring **45** may be formed from stainless steel or any other convenient material. Stitching **47** is provided to retain the ring **45** around the periphery of the fenestration **40**.

The ring **45** of nitinol preferably comprises at least two turns of wire with a loop **49** at each end of the wire. The loops **49** are provided to prevent the chance of damage to lumen wall because the pointed ends of the wire are effectively enclosed within the respective loops.

Alternatively one of the wires **45** may be a gold or other biocompatible heavy metal wire to provide radiographic visualisation of the ring to assist with positioning of the graft with respect to the branch vessel. Also in FIG. **5** there is shown a scalloped fenestration **50** which opens to the end **52** of the stent graft. Detail of the scalloped fenestration **50** can be seen in FIGS. **8** and **9**.

FIG. **8** shows an external view of a scalloped fenestration which can be placed at either the distal or proximal end of a stent graft and FIG. **9** shows an internal view of the fenestration shown in FIG. **8**. The fenestration comprises a scallop of graft material cut out of the body of the graft **3**. As can be seen in FIG. **9** an arch of resilient wire **52** is stitched around the periphery **54** of the scalloped fenestration. The wire **52** has a loop **56** formed at each end of it so that no sharp end of the wire is provided which could damage the wall of a vessel into which the stent graft is deployed. Because the wire or other material from which the U-shaped reinforcement **52** is resilient the fenestration will close up when the stent graft is in a contracted state for deployment into a bodily lumen such as the aorta and when released will open up to enable blood flow through the fenestration to a branch vessel.

The arch of resilient wire **52** is preferably made from a number of strands, such as three strands, of a resilient wire such as nitinol. The wire is stitched to the periphery of the fenestration with stitches **53**.

FIGS. 10 and 11 show two views of an alternative fenestration arrangement according to the invention. In this embodiment the fenestration 60 is provided in the tubular wall 5 of a stent graft and surrounding the fenestration 60 and providing reinforcement is an elastomeric ring 62 of a material such as silicon elastomer. The elastomeric ring 62 is sewn by stitching 64 into the periphery of the fenestration 60. Once again the elastomeric ring can be deformed so that it can be deployed within a deployment device and will open into the shape of the fenestration when deployed. The elastomeric ring will provide a certain amount of resiliency in position of the fenestration over a branch vessel and if deploying a side arm through the fenestration the elastomeric ring will provide a degree of blood sealing onto the branch stent graft.

FIGS. 12 and 13 show an alternative arrangement of fenestration on a stent graft. In FIG. 12 the stent graft 68 comprises a tubular wall body of graft material 70 with a lumen therethrough. The distal end 72 of the stent graft has distally extending exposed stent 74 and within the tubular wall body 70 there are proximal and distal internal stents 76 and 78 respectively and at least one external stent 80 intermediate the proximal distal ends. A fenestration is provided at the distal end 72 of the stent graft 68. In this embodiment the fenestration 82 is in the form of a scallop extending from the distal end 72 of the stent graft 68. The fenestration 82 is aligned with the struts 84 and 86 of the distal internal self expanding zig zag stent 78 so that the sides of the fenestration 90 can be stitched by stitching 92 to the struts 84 and 86 along at least part of their length.

Radiopaque or MRI opaque markers 94 are provided each side of the fenestration another marker 96 is provided at the base of the fenestration to enable visualisation of the fenestration to an accurate position with respect to a branch vessel such as a coeliac artery.

Once again, it will be noted that when the stent graft 68 is compressed for deployment within a delivery device the fenestration 82 will close up but upon release the fenestration will open to provide access to the branch artery.

FIG. 13A shows an alternative arrangement of a scalloped fenestration. In this embodiment the struts 93 and 95 of a zig-zag stent 97 are bent so that a more U-shaped fenestration 98 can be formed in the stent graft 99.

FIG. 14 shows an alternative embodiment of a stent graft with a scalloped fenestration and FIG. 15 shows a detailed internal view of the scalloped fenestration of FIG. 14.

In FIG. 14 the stent graft 100 comprises a tubular wall body of graft material 102 with a lumen therethrough. The distal end 104 of the stent graft has distally extending exposed stent 106 and within the tubular wall body 102 there are proximal and distal internal stents 108 and 110 respectively and at least one external stent 80 intermediate the proximal distal ends. A fenestration is provided at the distal end 104 of the stent graft 100. In this embodiment the fenestration 114 is in the form of a scallop extending from the distal end 104 of the stent graft 100. The fenestration 114 is aligned with spaced apart struts 116 and 118 of the distal internal self expanding zig zag stent 110 so that the sides of the fenestration 114 can be stitched by stitching 120 to the struts 116 and 118 along at least part of their length. A zig-zag portion 122 of the distal internal self expanding zig zag stent 110 extends uncovered through the fenestration and suture 124 joins a bend of the distally extending exposed stent 106 to a bend of the distal internal self expanding zig zag stent 110.

As can be seen in FIG. 15 an arch of resilient wire 130 is stitched around the periphery 132 of the scalloped fenestration. The wire 130 has a loop 134 formed at each end of it so that no sharp end of the wire is provided which could damage

the wall of a vessel into which the stent graft is deployed. Because the wire or other material from which the U-shaped reinforcement 130 is resilient the fenestration will close up when the stent graft is in a contracted state for deployment into a bodily lumen such as the aorta and when released will open up to enable blood flow through the fenestration to a branch vessel while at the same time ensuring that the periphery 132 of the scalloped fenestration engages against the wall of a vessel into which it is deployed and provides sealing.

The enlarged fenestration of this embodiment is illustrated as a double width as it takes in regions between two pairs of struts of the stent but may also be provided as a triple width. The enlarged fenestration enables a stent graft to be placed where there are several branch vessels in close proximity to each other which should not be occluded.

The scalloped fenestration shown in FIGS. 12 to 15 have been illustrated as being on the distal end of a stent graft but they may also be provided on the proximal end of a stent graft with or without the uncovered self expanding stent.

The use of a resilient reinforcement around the periphery of the fenestration provides a much more dimensionally stable aperture for the deployment of a leg or side arm extension. Particularly if using a balloon expandable stent as a leg or side arm extension is used the force of the balloon expansion will not tend to tear the graft material which may occur if no reinforcement was provided. The resiliency allows the fenestration to close off during contraction for deployment but to open up to a desired size and shape upon release in situ.

Throughout this specification various indications have been given as to the scope of this invention but the invention is not limited to any one of these but may reside in two or more of these combined together. The examples are given for illustration only and not for limitation.

Throughout this specification and the claims that follow unless the context requires otherwise, the words 'comprise' and 'include' and variations such as 'comprising' and 'including' will be understood to imply the inclusion of a stated integer or group of integers but not the exclusion of any other integer or group of integers.

What is claimed is:

1. A stent graft comprising a tubular body defined by a tubular wall and comprising a first end and a second end, an internal terminal zig zag self expanding stent in the tubular body at at least the first end, the zig zag stent comprising struts and bends between the struts, at least one scalloped fenestration in the tubular wall provided at the first end of the tubular wall, the at least one scalloped fenestration including a periphery, the periphery extending between at least two pairs of adjacent struts thereby defining an uncovered adjacent pair of struts and a bend therebetween in the scalloped fenestration and a resilient wire stitched around at least a portion of the periphery, whereby the resilient wire provides dimensional stability to the fenestration.

2. A stent graft as in claim 1 wherein the stent graft includes an exposed zig zag stent extending from the first end, the exposed stent comprising struts and bends between the struts and one of the bends of the exposed stent being fastened to the uncovered bend of the terminal zig zag stent.

3. A stent graft as in claim 1 wherein the resilient wire is selected from at least one of Nitinol or stainless steel.

4. A stent graft as in claim 1 wherein two spaced apart struts of the terminal stent other than the uncovered struts provide resilient peripheral reinforcement for the scalloped fenestration around at least a portion of the scalloped fenestration, whereby when the terminal stent expands, upon deployment of the stent graft, the struts spread apart thereby opening up the fenestration.

**11**

5. A stent graft as in claim 1 wherein terminal ends of resilient wire are provided with a loop, whereby the wire does not present a pointed end of wire which could damage a vessel.

6. A stent graft as in claim 1 further including least a second fenestration in the tubular wall intermediate the first end and the second end of the tubular body, the second fenestration including a second periphery and a ring of a resilient wire around the second periphery, whereby the ring provides

**12**

dimensional stability to the second fenestration to assist with sealing for deployment of a side arm extension therein.

7. A stent graft as in claim 6 wherein the ring includes at least two turns of the resilient wire.

8. A stent graft as in claim 7 wherein terminal ends of the resilient wire of the ring are provided with a loop, whereby the wire does not present a pointed end of wire which could damage a vessel.
