THEIR MEDICAL USE

This application is a 371 of PCT/EP04/03819 filed Apr. 8, 2004.

This invention relates to 2-aminopyrimidine derivatives and to their activity as inhibitors of IKK activity and use therapeutically to treat diseases and medical conditions mediated by IKK, e.g. diseases and medical conditions involving NFκB activation of gene expression, in particular inflammatory or autoimmune diseases.

Iodomethane (2.7 ml, 43.75 mmol) was then added and the turbid solution was stirred at 50° C. for another 2 hours. After cooling, a few drops of water were added and the mixture was partitioned between 1N-HCl and ether. The organic layer was washed with saturated sodium bicarbonate solution and brine. Drying over sodium sulfate and careful evaporation (product is volatile) gave a pale yellow oil. Yield: 4.45 g (90%).

## Example 240a

[4-(7-Nitro-1H-indol-3-yl)-pyrimidin-2-yl]-(2,2,6,6-tetramethyl-piperidin-4-yl)-amine

To a suspension of 1.60 g (40 mmol) sodium hydride in DMF (20 ml) was added 3-acetyl-7-nitroindol (*Org. Lett.* 2000, 2, 1485-1487). After stirring at room temperature for 60 minutes, 6.08 g (36.5 mmol) SEM-chloride was added. Stirring was continued for 16 hours. Then the reaction mixture was poured on icewater, the aqueous phase was extracted twice with ethylacetate, the organic phase was dried (NaSO<sub>4</sub>) and evaporated. Crystallisation from ethanol gave 9.26 g (27.7 mmol, 83%) of the SEM protected indole.

1 g of the material described above was dissolved in dimethylformamide-dimethylacetal and heated under reflux for 24 hours. Evaporation of the excess DMF-dimethylacetal gave a crude enamino-ketone which was dissolved in 40 ml 1-butanol and treated with 2.27 g (7.7 mmol) of tetramethylpiperidyl-guanidine hemisulfate and 2.13 g (15.3 mmol) potassium carbonate. The reaction mixture was heated under reflux for 16 hours, then 200 ml water was added and the mixture was extracted into ethylacetate. Removal of the solvent yielded the crude product which was further purified by crystallisation from ether. Thus a total of 0.38 g (0.7 mmol, 28%) pyrimidine was obtained.

To 0.38 g of SEM protected indolyl-pyrimidine in 30 ml tetrahydrofuran 1.0 ml tetrabutylammonium fluoride (1.0 M in THF) was added. The mixture was stirred at 60° C. for 16 hours, poured onto water and extracted with ethylacetate. Removal of the solvent and crystallisation from ether yielded 0.15 g (3.9 mmol, 54%) of the title compound.

The vial was then placed in a Smith-Creator™ microwave reactor and heated at 16° C. for 600 seconds. After purification by preparative HPLC chromatography the desired title product was obtained.

The Agents of the Invention, as defined above, e.g., of formula I, II and III particularly as exemplified, in free or pharmaceutically acceptable acid addition salt form, exhibit pharmacological activity and are useful as pharmaceuticals, e.g. for therapy, in the treatment of diseases and conditions as hereinafter set forth.

In particular Agents of the Invention are potent inhibitors of IKK and thus have potential for pharmaceutical use for treatment of diseases and medical conditions mediated by IKK. In particular, as inhibitors of IKK, the Agents of the invention can act to inhibit or even block NFκB activated gene expression and thus act to inhibit production of inflammatory cytokines, such as TNF-α and IL-1, and also to potentially block the effects of these cytokines on their target cells. These and other pharmacological activities of the Agents of the Invention as may be demonstrated in standard test methods, for example as described below:

#### Experimental Procedures—IkB Kinase Assay and IkB Degradation Assay

Expression and purification of recombinant IkBα substrate. The cDNA encoding human IkBα was cloned into the vector pET17b (Novagen, Inc., Madison, Wis., U.S.A.) and recombinant IkBα protein was expressed in *E. coli* strain BL21 DE3 pLysS (Novagen, Inc., Madison, Wis., U.S.A.) according to the suppliers specifications and purified as follows (all steps at 0-4° C.). 3 g of wet cell pellet was resuspended in 10 ml of 50 mM Tris/HCl buffer at pH 8.0, containing 1 mM DTE, and sonicated on ice (3×1 min). The resulting homogenate was centrifuged in a Beckman JA-20 rotor (Beckmann Instruments, Fullerton, Calif., U.S.A.) at 15,000 rpm for 15 minutes and the IkBα protein was precipitated from the supernatant by addition of 15% (w/v) ammonium sulfate. After incubation for 15 minutes and centrifugation in a Beckman JA-20 rotor at 14,000 rpm for 12 minutes, the pellet was dissolved in 20 ml of 50 mM Tris/HCl at pH 8.0,

## 192

containing 1 mM DTE, and loaded onto a 35 ml Q-Sepharose Fast Flow column (Amersham Pharmacia Biotech AB, Uppsala, Sweden) equilibrated with the same buffer. Bound proteins were eluted with a linear gradient of 0-1 M NaCl. IkBα-containing fractions, which eluted between 0.55 and 0.6 M salt, were pooled, frozen by dripping the solution into liquid nitrogen, and stored at -80° C. Typical yields were 2-7 mg of pure protein per liter of *E. coli* cell culture.

Purification of IkB kinase. IkB kinase was purified from TNFα-stimulated HeLa cells. HeLa cells were maintained in RPMI 1640 medium (GIBCO BRL, Life Technologies AG, Basel, Switzerland) supplemented with 5% fetal calf serum, 446 mg/l L-alanyl-L-glutamine, 50 μM mercaptoethanol. For 12 hours prior to stimulation, the cells were starved in serum-free RPMI 1640 medium supplemented with L-alanyl-L-glutamine, 50 μM mercaptoethanol, 100 IU/ml penicilline (GIBCO BRL, Life Technologies AG, Basel, Switzerland) and 100 μg/ml streptomycine (GIBCO BRL, Life Technologies AG, Basel, Switzerland). The starved cells were stimulated with 50 ng/ml TNFα for 5 min at 37° C., immediately chilled to 4° C. and collected by centrifugation. All subsequent steps were carried out at 4° C. or on ice. HeLa cells were suspended in ice-cold extraction buffer (10 mM Tris/HCl at pH 7.5, containing 10 mM KCl, 1 mM EDTA, 1 mM DTE and 100 μg/ml PMSF) and lysed by 20 strokes in a dounce homogenizer with a pistil B. Centrifugation in a Beckman JA-20 rotor for 30 minutes at 12,000 rpm and then in a Beckman Ti 45 rotor at 42,000 rpm for 2 hours yielded the post-ribosomal supernatant from which the proteins were precipitated with ammonium sulfate in a stepwise manner: addition of ammonium sulfate to a concentration of 8% (w/v), incubation for 15 min and centrifugation in a Beckman JA-20 rotor at 14,000 rpm was followed by a second precipitation step at 31% (w/v) ammonium sulfate. After an incubation period of 15 min and centrifugation in a Beckman JA-20 rotor at 14,000 rpm the latter pellet was dissolved in 50 ml of 25 mM Tris/HCl buffer at pH 8.0, containing 1 mM DTE, and dialyzed extensively against the same buffer. The protein solution was then loaded onto a 300 ml Q-Sepharose Fast Flow column which was equilibrated with the above dialysis buffer. Bound proteins were eluted with a gradient of 0-1 M NaCl. IkB kinase activity, which eluted from the column between 300 mM and 350 mM NaCl, was concentrated by ultrafiltration with Amicon PM 10 filters (Amicon, Inc., Beverly, Mass., U.S.A.). The concentrated protein solution was then passed over a Sephacryl S300 column (Amersham Pharmacia Biotech AB, Uppsala, Sweden) developed in 25 mM Tris/HCl buffer at pH 8.0, containing 150 mM NaCl and 1 mM DTE. The IkB kinase-containing fractions were pooled, loaded onto a MonoQ column (Amersham Pharmacia Biotech AB, Uppsala, Sweden) and eluted with a linear gradient of 0.15-0.5 M NaCl in 25 mM Tris/HCl, pH 8.0, 1 mM DTE. Purified IkB kinase was stored frozen at -80° C. until further use.

IkB kinase activity assay. Nunc-ImmunoPlates MaxiSorp (Life Technologies AG, Basel, Switzerland) were coated for 2 hours at room temperature with 50 μl/well of 25 μM IkBα in 50 mM Tris/HCl at pH 8.0, 1 mM DTE. After blocking for 1 hour with a solution of 2% (w/v) BSA in PBS buffer, the plates were washed 5 times with PBS containing 0.05% (v/v) Tween 20. The kinase reaction was done in 50 mM Tris/HCl buffer at pH 8.0, containing 10 mM MgCl<sub>2</sub> and 1 mM DTE. The substrate ATP was used at a concentration of 10 μM and the reaction started by the addition of the purified IkB kinase. For measuring the inhibition of IkB kinase by compounds, the test compounds were dissolved in DMSO and added to the enzyme reaction prior to addition of the kinase. After 20-90

minutes at room temperature the reaction was terminated by washing with PBS/0.05% (v/v) Tween 20. The phosphorylated I $\kappa$ B $\alpha$  was then detected using a phospho-specific I $\kappa$ B $\alpha$  (Ser32) antibody (New England Biolabs, Beverly, Mass., U.S.A., cat. # 9041S) in combination with a horseradish peroxidase conjugated anti-rabbit IgG antibody (Santa Cruz Biotechnology, Santa Cruz, Calif., U.S.A.) and employment of BM Blue POD substrate (Roche Diagnostics AG, Basel, Switzerland) as follows. The first, phospho-specific I $\kappa$ B $\alpha$  antibody was diluted 1:1500 with PBS, 2% (w/v) BSA, 0.05% (v/v) Tween 20 and added to the wells. After incubation for 1 hour at room temperature, the plates were washed 5 times with PBS containing 0.05% (v/v) Tween 20. The second antibody, diluted 1:3000 with PBS, 2% (w/v) BSA, 0.05% (v/v) Tween 20, was then added to the wells and the plates allowed to incubate for 1 hour at room temperature. Following 5 washing steps with PBS, 2% (w/v) BSA, 0.05% (v/v) Tween 20, 50  $\mu$ l BM Blue POD substrate was added to each well. The color reaction was stopped by addition of 50  $\mu$ l of 2.25 M H<sub>2</sub>SO<sub>4</sub> and the absorbance of the wells measured at 450 nm versus 650 nm. Each compound was tested twice in duplicate and calculation of IC<sub>50</sub> values were done using the GraphPad Prism software (GraphPad Software, Inc., San Diego, Calif., U.S.A.). Agents of the invention typically have IC<sub>50</sub> values when measured in the above assay in the range from 20 to 1000 nM.

I $\kappa$ B $\alpha$  degradation assay. THP-1 cells were maintained in RPMI 1640 medium with Glutamax-I (GIBCO BRL, Life Technologies AG, Basel, Switzerland) supplemented with 10% fetal calf serum, 100 U/ml penicilline and 100  $\mu$ g/ml streptomycine. For the assay, the cells were transferred to 96-well plates (Nunc, Life Technologies AG, Basel, Switzerland, cat. #245128) at a density of 600 000 cells/well and stimulated with 10 ng/ml TNF $\alpha$  for 12 minutes at room temperature. For measuring the inhibition of TNF $\alpha$ -stimulated I $\kappa$ B $\alpha$  degradation by compounds, the test compounds were dissolved in DMSO and added to the cell suspension prior to addition of TNF $\alpha$ . Following incubation, the plates were centrifuged at 1200 rpm in a Heraeus Megafuge 2.0R (Heraeus AG, Zuerich, Switzerland), the supernatants discarded, and the cell pellet dissolved in 50  $\mu$ l/well Laemmli sample buffer (Bio-Rad Laboratories AG, Glattbrugg, Switzerland, cat. #161-0737) supplemented with 5% (v/v) 2-mercaptoethanol. The concentration of I $\kappa$ B $\alpha$  in the individual samples was analyzed by Western blotting using NOVEX 10% Tris-Glycine gels (Invitrogen, Life Technologies AG, Basel, Switzerland) and the ECL+Plus Western blotting detection reagents (Amersham Pharmacia Biotech AB, Uppsala, Sweden) according to the manufacturer's specifications. The primary antibody was an anti-I $\kappa$ B $\alpha$  antibody (Santa Cruz Biotechnology, Santa Cruz, Calif., U.S.A., cat. # sc-371) diluted 1:1000 and the secondary antibody a goat anti-rabbit IgG HRP-conjugated antibody (Bio-Rad Laboratories AG, Glattbrugg, Switzerland, cat. #172-1019). Each compound was tested in duplicate and estimation of IC<sub>50</sub> values were done based on densitometric scanning or visual inspection. Agents of the invention typically have IC<sub>50</sub> values when measured in the above assay in the range from 0.5 to 30  $\mu$ M.

#### Assay for Inhibition of TNF- $\alpha$ Release from hPBMCs

Human peripheral blood mononuclear cells (hPBMCs) are prepared from the peripheral blood of healthy volunteers using ficoll-hypaque density separation according to the method of Hansell et al., J. Imm. Methods (1991) 145: 105. and used at a concentration of 10<sup>5</sup> cells/well in RPMI 1640 plus 10% FCS. Cells are incubated with serial dilutions of the test compounds for 30 minutes at 37° C. prior to the addition

of IFN $\gamma$  (100 U/ml) and LPS (5 mg/ml) and subsequently further incubated for three hours. Incubation is terminated by centrifugation at 1400 RPM for 10 min. TNF- $\alpha$  in the supernatant is measured using a commercial ELISA (Innotest hTNFa, available from innogenetics N.V., Zwijnaarde, Belgium). Agents of the Invention are tested at concentrations of from 0 to 10 mM. Exemplified Agents of the Invention typically suppress TNF release in this assay with IC<sub>50</sub> values ranging from about 100 nM to about 3000 nM or less when tested in this assay.

#### Assay for Inhibition of TNF- $\alpha$ Production in LPS Stimulated Mice

Injection of lipopolysaccharide (LPS) induces a rapid release of soluble tumour necrosis factor (TNF- $\alpha$ ) into the periphery. This model is be used to analyse prospective blockers of TNF release in vivo.

LPS (20 mg/kg) is injected i.v. into OF1 mice (female, 8 week old). One (1) hour later blood is withdrawn from the animals and TNF levels are analysed in the plasma by an ELISA method using an antibody to TNF- $\alpha$ . Using 20 mg/kg of LPS levels of up to 15 ng of TNF- $\alpha$ /ml plasma are usually induced. Compounds to be evaluated are given either orally or s.c. 1 to 4 hours prior to the LPS injection. Inhibition of LPS-induced TNF-release is taken as the readout.

Agents of the Invention typically inhibit TNF production to the extent of up to about 50% or more in the above assay when administered at 30 mg/kg p.o., i.v. or s.c.

As indicated in the above assays Agents of the Invention are potent inhibitors of TNF- $\alpha$  release. Accordingly, the Novel Compounds have pharmaceutical utility as follows:

Agents of the Invention are useful for the prophylaxis and treatment of diseases or pathological conditions mediated by cytokines such as TNF $\alpha$  and IL-1, e.g., inflammatory conditions, autoimmune diseases, severe viral infections, and organ or tissue transplant rejection, e.g. for the treatment of recipients of heart, lung, combined heart-lung, liver, kidney, pancreatic, skin or corneal transplants and for the prevention of graft-versus-host disease, such as following bone marrow transplants. In addition, Agents of the Invention are useful for the treatment of cancer.

Agents of the Invention are particularly useful for the treatment, prevention, or amelioration of autoimmune disease and of inflammatory conditions, in particular inflammatory conditions with an aetiology including an autoimmune component such as arthritis (for example rheumatoid arthritis, arthritis chronica progrediente and arthritis deformans) and rheumatic diseases. Specific auto-immune diseases for which Agents of the Invention may be employed include autoimmune haematological disorders (including e.g. hemolytic anaemia, aplastic anaemia, pure red cell anaemia and idiopathic thrombocytopenia), systemic lupus erythematosus, polychondritis, sclerodoma, Wegener granulomatosis, dermatomyositis, chronic active hepatitis, myasthenia gravis, psoriasis, Steven-Johnson syndrome, idiopathic sprue, autoimmune inflammatory bowel disease (including e.g. ulcerative colitis and Crohn's disease), endocrine ophthalmopathy, Graves disease, sarcoidosis, multiple sclerosis, primary biliary cirrhosis, juvenile diabetes (diabetes mellitus type I), uveitis (anterior and posterior), keratoconjunctivitis sicca and vernal keratoconjunctivitis, interstitial lung fibrosis, psoriatic arthritis and glomerulonephritis (with and without nephrotic syndrome, e.g. including idiopathic nephrotic syndrome or minimal change nephropathy).

Agents of the Invention are also useful for the treatment, prevention, or amelioration of asthma, bronchitis, pneumo-

coniosis, pulmonary emphysema, and other obstructive or inflammatory diseases of the airways.

Agents of the Invention are useful for treating undesirable acute and hyperacute inflammatory reactions which are mediated by TNF, especially by TNF $\alpha$ , e.g., acute infections, for example septic shock (e.g., endotoxic shock and adult respiratory distress syndrome), meningitis, pneumonia; and severe burns; and for the treatment of cachexia or wasting syndrome associated with morbid TNF release, consequent to infection, cancer, or organ dysfunction, especially AIDS-related cachexia, e.g., associated with or consequential to HIV infection.

Agents of the Invention are also useful for the treatment of neurodegenerative diseases, such as Alzheimer's disease, acute encephalitis, brain injury, multiple sclerosis including demyelination and oligodendrocyte loss in multiple sclerosis and inflammatory nervous system diseases, such as neuroinflammatory and stroke.

Advantageously treatment with Agents of the Invention may result in inhibition of COX-2 activity and as such the Agents of the Invention conveniently have the following additional uses. Thus the Agents of the Invention are particularly useful for the treatment of cyclooxygenase dependent disorders in mammals, including inflammation, pyresis, pain, osteoarthritis, rheumatoid arthritis, migraine headache, neurodegenerative diseases (such as multiple sclerosis), Alzheimer's disease, osteoporosis, asthma, lupus and psoriasis.

The Agents of the Invention are further useful for the treatment of neoplasia particularly neoplasia that produce prostaglandins or express cyclooxygenase, including both benign and cancerous tumors, growths and polyps. Compounds of the present invention may be employed for the treatment of any neoplasia as for example recited in International Patent Application Publication No. WO 98/16227, published 23 Apr. 1998, in particular epithelium cell-derived neoplasia. Compounds of the present invention are in particular useful for the treatment of liver, bladder, pancreas, ovarian, prostate, cervical, lung and breast cancer and, especially gastrointestinal cancer, for example cancer of the colon, and skin cancer, for example squamous cell or basal cell cancers and melanoma.

The term "treatment" as used herein is to be understood as including both therapeutic and prophylactic modes of therapy, e.g. in relation to the treatment of neoplasia, therapy to prevent the onset of clinically or preclinically evident neoplasia, or for the prevention of initiation of malignant cells or to arrest or reverse the progression of premalignant to malignant cells, as well as the prevention or inhibition of neoplasia growth or metastasis. In this context, the present invention is, in particular, to be understood as embracing the use of compounds of the present invention to inhibit or prevent development of skin cancer, e.g. squamous or basal cell carcinoma consequential to UV light exposure, e.g. resultant from chronic exposure to the sun.

The Agents of the Invention may also be used in ocular applications which include the treatment of ocular disorders, in particular of ocular inflammatory disorders, of ocular pain including pain associated with ocular surgery such as PRK or cataract surgery, of ocular allergy, of photophobia of various etiology, of elevated intraocular pressure (in glaucoma) by inhibiting the production of trabecular meshwork inducible glucocorticoid response (TIGR) protein, and of dry eye disease.

Agents of the Invention are particularly useful for treating diseases of bone metabolism including osteoarthritis, osteoporosis and other inflammatory arthritides.

For the above indications the appropriate dosage will, of course, vary depending, for example, on the particular Agent of the Invention employed, the subject to be treated, the mode of administration and the nature and severity of the condition being treated. However, in general, satisfactory results in animals are obtained at daily dosages of from about 1 to about 50 mg/kg/day p.o. In larger mammals, for example humans, an indicated daily dosage is in the range of from about 50 to about 750 mg of an Agent of the Invention administered orally once or, more suitably, in divided dosages two to four times/day.

The Agents of the Invention may be administered by any conventional route, e.g. orally, for example in the form of solutions for drinking, tablets or capsules or parenterally, for example in the form of injectable solutions or suspensions. Normally for systemic administration oral dosage forms are preferred, although for some indications the Agents of the Invention may also be administered topically or dermally, e.g. in the form of a dermal cream or gel or like preparation or, for the purposes of application to the eye, in the form of an ocular cream, gel or eye-drop preparation; or may be administered by inhalation, e.g., for treating asthma. Suitable unit dosage forms for oral administration comprise e.g. from 25 to 250 mg of Agent of the Invention per unit dosage.

In accordance with the foregoing the present invention also provides in a further series of embodiments:
