THIENOPYRIMIDINE DERIVATIVES AS  
PI3K INHIBITORS

## RELATED APPLICATIONS

This application is a National Stage Application under 35 U.S.C. §371 and claims the benefit of priority to International Application No. PCT/GB2008/003621 having an International Filing Date of 27 Oct. 2008 which claims the benefit of priority of United Kingdom Application Serial Number 0721059.8 filed on 26 Oct. 2007, which are herein incorporated by reference in their entireties.

## FIELD OF THE INVENTION

The present invention relates to indolyl thienopyrimidine compounds and to their use as inhibitors of phosphatidylinositol 3-kinase (PI3K).

## BACKGROUND TO THE INVENTION

Phosphatidylinositol (hereinafter abbreviated as "PI") is one of a number of phospholipids found in cell membranes. In recent years it has become clear that PI plays an important role in intracellular signal transduction. In the late 1980s, a PI3 kinase (PI3K) was found to be an enzyme which phosphorylates the 3-position of the inositol ring of phosphatidylinositol (M. Whitman et al., 1988, Nature, 332, 644-646).

PI3K was originally considered to be a single enzyme, but it has now been clarified that a plurality of subtypes are present in PI3K. Each subtype has its own mechanism for regulating activity. Three major classes of PI3Ks have been identified on the basis of their in vitro substrate specificity (B. Vanhaesebroeck et al, 1997, Trends in Biochemical Sciences, 22, 267-272). Substrates for class I PI3Ks are PI, PI 4-phosphate (PI4P) and PI 4,5-biphosphate (PI (4,5)P2). Class I PI3Ks are further divided into two groups, class Ia and class Ib, in terms of their activation mechanism. Class Ia PI3Ks include PI3K p110 $\alpha$ , p110 $\beta$  and p110 $\delta$  subtypes, which transmit signals from tyrosine kinase-coupled receptors. Class Ib PI3K includes a p110 $\gamma$  subtype activated by a G protein-coupled receptor. PI and PI(4)P are known as substrates for class II PI3Ks. Class II PI3Ks include PI3K C2 $\alpha$ , C21 $\beta$  and C2 $\gamma$  subtypes, which are characterized by containing C2 domains at the C terminus. The substrate for class III PI3Ks is PI only.

In the PI3K subtypes, the class Ia subtype has been most extensively investigated to date. The three subtypes of class Ia are heterodimers of a catalytic 110 kDa subunit and regulatory subunits of 85 kDa or 55 kDa. The regulatory subunits contain SH2 domains and bind to tyrosine residues phosphorylated by growth factor receptors with a tyrosine kinase activity or oncogene products, thereby inducing the PI3K activity of the p110 catalytic subunit which phosphorylates its lipid substrate. Thus, the class Ia subtypes are considered to be associated with cell proliferation and carcinogenesis, immune disorders and conditions involving inflammation.

WO 01/083456 describes a series of condensed heteroaryl derivatives which have activity as inhibitors of PI3 K and which suppress cancer cell growth.

## SUMMARY OF THE INVENTION

It has now been found that a series of novel thienopyrimidine compounds have activity as inhibitors of PI3K. The compounds exhibit selectivity for the p110 $\delta$  subtype of PI3 kinase, over both other class Ia and class Ib PI3Ks. Accord-

ingly, the present invention provides a compound which is a thienopyrimidine of formula (I):

wherein

W represents a thiophene ring;

R<sup>1</sup> and R<sup>2</sup> form, together with the N atom to which they are attached, a group of the following formula (IIa):

in which A is selected from:

- a group selected from homopiperazine, piperazine, piperidine, pyrrolidine and azetidine, which group is substituted by one or more substituents selected from C<sub>3</sub>-C<sub>10</sub> cycloalkyl which is unsubstituted or substituted, an O-containing ring which is tetrahydrofuran, tetrahydropyran or oxetane and which is unsubstituted or substituted, —NR'—(CR'<sub>2</sub>)<sub>r</sub>—X wherein each R' is independently H or C<sub>1</sub>-C<sub>6</sub> alkyl, r is 0 or 1 and X is selected from C<sub>3</sub>-C<sub>10</sub> cycloalkyl which is unsubstituted or substituted, an O-containing ring which is tetrahydrofuran, tetrahydropyran or oxetane and which is unsubstituted or substituted, and a 4-membered saturated N-containing heterocyclic ring which is unsubstituted or substituted, and which group is optionally substituted by one or more further substituents;
- a 4- to 7-membered saturated N-containing heterocyclic ring which includes 0 or 1 additional heteroatoms selected from N, S and O, the ring being fused to a second ring selected from a 4- to 7-membered saturated N-containing heterocyclic ring as defined above, a 5- to 12-membered unsaturated heterocyclic ring, a 5- to 7-membered saturated O-containing heterocyclic ring, a 3- to 12-membered saturated carbocyclic ring and an unsaturated 5- to 12-membered carbocyclic ring to form a heteropolycyclic ring system, the heteropolycyclic ring system being unsubstituted or substituted;
- a 4- to 7-membered saturated N-containing heterocyclic ring which includes 0 or 1 additional heteroatoms selected from N, S and O and which further comprises, linking two constituent atoms of the ring, a bridgehead group selected from —(CR'<sub>2</sub>)<sub>n</sub>— and —(CR'<sub>2</sub>)<sub>r</sub>—O—(CR'<sub>2</sub>)<sub>s</sub>— wherein each R' is as defined above, n is 1, 2 or 3, r is as defined above and s is 0 or 1, the remaining ring positions being unsubstituted or substituted; and

3

(d) a group of formula (IIb):

(IIb)

wherein ring B is a 4- to 7-membered saturated N-containing heterocyclic ring which includes 0 or 1 additional heteroatoms selected from N, S and O and ring B' is a 3- to 12-membered saturated carbocyclic ring, a 5- to 7-membered saturated O-containing heterocyclic ring or a 4- to 7-membered saturated N-containing heterocyclic ring as defined above, each of B and B' being unsubstituted or substituted;

m is 0, 1 or 2;

$R^3$  is H or  $C_1$ - $C_6$  alkyl;  $R^a$  is selected from  $R'$ , halo, CN,  $C(O)NR'_2$ , halo( $C_1$ - $C_6$ )alkyl,  $SO_2R'$ ,  $SO_2NR'_2$ ,  $NR'SO_2R'$ ,  $NR'C(O)R'$ ,  $NR'C(O)OR'$ ,  $NR'C(O)NR'_2$ ,  $OR'$  and  $NR'_2$ , wherein each  $R'$  is independently as defined above; and

$R^4$  is an indole group which is unsubstituted or substituted; or a pharmaceutically acceptable salt thereof.

#### DETAILED DESCRIPTION OF THE INVENTION

As used herein, the term "fused" indicates that two rings are joined together by a common bond between two adjacent ring atoms. The term "spiro-fused" indicates that two rings are linked through a single common carbon atom. The term "bridgehead" denotes a linking group, of one or more atoms in length, which connects two non-adjacent ring atoms. In each of these three cases a polycyclic (typically a bicyclic) structure is the result.

When any group, ring, group, ring, substituent or moiety defined herein is substituted, it is typically substituted by Z or  $R^5$  as defined below.

A  $C_1$ - $C_6$  alkyl group is linear or branched. A  $C_1$ - $C_6$  alkyl group is typically a  $C_1$ - $C_4$  alkyl group, for example a methyl, ethyl, n-propyl, i-propyl, n-butyl, sec-butyl or tert-butyl group. A  $C_1$ - $C_6$  alkyl group is unsubstituted or substituted, typically by one or more groups Z or  $R^5$  as defined below. Typically it is  $C_1$ - $C_4$  alkyl, for example methyl, ethyl, i-propyl, n-propyl, t-butyl, s-butyl or n-butyl.

Z is selected from H, unsubstituted  $C_1$ - $C_6$  alkyl, halo,  $-OR$ ,  $-SR$ ,  $-(C(R^6)_2)_qR$ ,  $-CH_2OR$ ,  $-CF_3$ ,  $-(halo)-C_1$ - $C_6$  alkyl,  $-(C(R^6)_2)_qO$ ,  $-(halo)-C_1$ - $C_6$  alkyl,  $-CO_2R$ ,  $-(C(R^6)_2)_qCO_2R$ ,  $-(C(R^6)_2)_qCOR$ ,  $CF_2OH$ ,  $CH(CF_3)OH$ ,  $C(CF_3)_2OH$ ,  $-(CH_2)_qOR$ ,  $-(C(R^6)_2)_qOR$ ,  $-(CH_2)_qNR_2$ ,  $-(C(R^6)_2)_qNR_2$ ,  $-C(O)N(R)_2$ ,  $-(C(R^6)_2)_qCONR_2$ ,  $-NR_2$ ,  $-(C(R^6)_2)_qNR_2$ ,  $-(C(R^6)_2)_qNRC(O)R$ ,  $-(C(R^6)_2)_qNRC(O)OR$ ,  $-S(O)_pR$ ,  $-S(O)_pN(R)_2$ ,  $-(C(R^6)_2)_qS(O)_pN(R)_2$ ,  $-OC(O)R$ ,  $-(C(R^6)_2)_qOC(O)R$ ,  $-OC(O)N(R)_2$ ,  $-(C(R^6)_2)_qOC(O)N(R)_2$ ,  $-NRS(O)_pR$ ,  $-(C(R^6)_2)_qNRS(O)_pR$ ,  $-NRC(O)N(R)_2$ ,  $-(C(R^6)_2)_qNRC(O)N(R)_2$ , CN,  $-NO_2$ ,  $=O$ , a 5- to 12-membered aryl or heteroaryl group, which group is unsubstituted or substituted and a 4- to 7-membered saturated N-containing heterocyclic ring, wherein each R is independently selected from H,  $C_1$ - $C_6$  alkyl,  $C_3$ - $C_{10}$  cycloalkyl and a 5- to 12-membered aryl or heteroaryl group, the group being unsubstituted or substituted, or when two groups R are attached to an N atom they form, together with the N atom, a 4- to 7-membered saturated N-containing heterocyclic ring; p is 1 or 2 and q is 0, 1 or 2.

4

$R^5$  is selected from  $C_1$ - $C_6$  alkoxy,  $OR^6$ ,  $SR^6$ ,  $S(O)_pR^6$ , nitro, CN, halogen,  $-C(O)R^6$ ,  $-CO_2R^6$ ,  $-C(O)N(R^6)_2$  and  $-N(R^6)_2$ .  $R^6$ , each of which is the same or different when more than one is present in a given substituent, is selected from H,  $C_1$ - $C_6$  alkyl and  $C_3$ - $C_{10}$  cycloalkyl, and p is 1 or 2.

A halogen or halo group is F, Cl, Br or I. Preferably it is F, Cl or Br. A  $C_1$ - $C_6$  alkyl group substituted by halogen may be denoted by the term "halo- $C_1$ - $C_6$  alkyl", which means an alkyl group in which one or more hydrogens is replaced by halo. A halo- $C_1$ - $C_6$  alkyl group preferably contains one, two or three halo groups. A preferred example of such a group is trifluoromethyl.

A  $C_1$ - $C_6$  alkoxy group is linear or branched. It is typically a  $C_1$ - $C_4$  alkoxy group, for example a methoxy, ethoxy, propoxy, i-propoxy, n-propoxy, n-butoxy, sec-butoxy or tert-butoxy group. A  $C_1$ - $C_6$  alkoxy group is unsubstituted or substituted, typically by one or more groups Z or  $R^5$  as defined above.

A  $C_3$ - $C_{10}$  cycloalkyl group may be, for instance,  $C_3$ - $C_8$  cycloalkyl such as cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, or cycloheptyl. Typically it is  $C_3$ - $C_6$  cycloalkyl, for example cyclopropyl, cyclobutyl or cyclopentyl. In one embodiment it is cyclopropyl. A  $C_3$ - $C_{10}$  cycloalkyl group is unsubstituted or substituted, typically by one or more groups Z or  $R^5$  as defined above.

A saturated 4- to 7-membered N-containing heterocyclic ring typically contains one nitrogen atom and either an additional N atom or an O or S atom, or no additional heteroatoms. It may be, for example, azetidine, pyrrolidine, piperidine, piperazine, morpholine, thiomorpholine or homopiperazine. A 4-membered saturated N-containing heterocyclic ring is typically azetidine.

A 4- to 7-membered, or a 4-membered, saturated N-containing heterocyclic ring as defined above is unsubstituted or substituted on one or more ring carbon atoms and/or on any additional N atom present in the ring. Examples of suitable substituents include one or more groups Z or  $R^5$  as defined above, and a  $C_1$ - $C_6$  alkyl group which is unsubstituted or substituted by a group Z or  $R^5$  as defined above.

When A is a group selected from piperazine, piperidine and pyrrolidine which is substituted by  $-NR'-(CR'_2)_r-X$  as defined under (a) above, parameter r is typically 1. A is typically substituted by a group selected from cyclopropyl, cyclobutyl,  $-NH-CH_2$ -cyclopropyl,  $-NH$ -cyclopropyl,  $-NH-CH_2$ -tetrahydrofuranyl,  $-NH$ -tetrahydrofuranyl,  $-NH-CH_2$ -tetrahydropyranyl,  $-NH$ -tetrahydropyranyl and azetidiny. Specific examples of such a group A include the following structures:

(iv)

The group A is optionally substituted by one or more further substituents. Such further substituents are typically selected from groups Z and R<sup>5</sup> as defined above.

A 5- to 7-membered saturated O-containing heterocyclic ring contains at least one O atom and 0, 1 or 2, typically 0 or 1, additional heteroatoms selected from O, N and S. It is, for instance, tetrahydropyran, tetrahydropyran or morpholine.

A 3- to 12-membered saturated carbocyclic ring is a 3-, 4-, 5-, 6-, 7-, 8-, 9-, 10, 11- or 12-membered carbocyclic ring containing only saturated bonds. It is a monocyclic or fused bicyclic ring system. It is, for instance, a 3- to 7-membered saturated carbocyclic ring. Examples include cyclopropane, cyclobutane, cyclopentane, cyclohexane and cycloheptane, and bicyclic ring systems in which two such rings are fused together.

An unsaturated 5- to 12-membered carbocyclic group is a 5-, 6-, 7-, 8-, 9-, 10, 11- or 12-membered carbocyclic ring containing at least one unsaturated bond. It is a monocyclic or fused bicyclic ring system. The group is non-aromatic or aromatic, for instance a 5- to 12-membered aryl group. Examples include benzene, naphthalene, indane, indene and tetrahydronaphthalene rings, or phenyl, naphthyl, indanyl, indenyl and tetrahydronaphthyl groups. The group is unsubstituted or substituted, typically by one or more groups Z or R<sup>5</sup> as defined above.

An aryl group is a 5- to 12-membered aromatic carbocyclic group. It is monocyclic or bicyclic. Examples include phenyl and naphthyl groups. The group is unsubstituted or substituted, for instance by a group Z or R<sup>5</sup> as defined above.

An unsaturated 5- to 12-membered heterocyclic group is a 5-, 6-, 7-, 8-, 9-, 10, 11- or 12-membered heterocyclic ring containing at least one unsaturated bond and at least one heteroatom selected from O, N and S. It is a monocyclic or fused bicyclic ring system. The group is non-aromatic or aromatic, for instance heteroaryl. The group may be, for example, furan, thiophene, pyrrole, pyrrolopyrazine, pyrrolopyrimidine, pyrrolopyridine, pyrrolopyridazine, indole, isoindole, pyrazole, pyrazolopyrazine, pyrazolopyrimidine, pyrazolopyridine, pyrazolopyridazine, imidazole, imidazopyrazine, imidazopyrimidine, imidazopyridine, imidazopyridazine, benzimidazole, benzodioxole, benzodioxine, benzoxazole, benzothiazole, benzofuran, indoliziny, isoxazole, oxazole, oxadiazole, thiazole, isothiazole, thiadiazole, dihydroimidazole, dihydrobenzofuran, dihydrodioxinopyridine, dihydropyrrolopyridine, dihydrofuranopyridine, dioxolopyridine, pyridine, quinoline, isoquinoline, thienopyrimidine, quinoxaline, tetrahydrobenzofuran, tetrahydroquinoline, tetrahydroisoquinoline, 5,6,7,8-tetrahydro-imidazo[1,5-a]pyrazine, 5,6,7,8-tetrahydro-imidazo[1,2-a]pyrazine, thienopyrazine, pyrimidine, pyridazine, pyrazine, triazine, triazole or tetrazole. The group is unsubstituted or substituted, typically by one or more groups Z or R<sup>5</sup> as defined above.

Heteroaryl is a 5- to 12-membered aromatic heterocyclic group which contains 1, 2, 3, or 4 heteroatoms selected from O, N and S. It is monocyclic or bicyclic. Typically it contains one N atom and 0, 1, 2 or 3 additional heteroatoms selected from O, S and N. It may be, for example, a 5- to 7-membered heteroaryl group. Typically it is selected from the heteroaryl

6

groups included in the above list of options for a 5- to 12-membered unsaturated heterocyclic group.

Examples of a 4- to 7-membered saturated N-containing heterocyclic ring which is fused to a second ring as defined above to form a heteropolycyclic ring system include a group selected from azetidine, pyrrolidine, piperidine, piperazine, morpholine, thiomorpholine and homopiperazine, said group being fused to a second ring as defined above. The second ring is typically a 4- to 7-membered saturated N-containing heterocyclic ring as defined above or a 5- to 12-membered unsaturated heterocyclic group. More typically the second ring is a 5-, 6- or 7-membered saturated N-containing heterocyclic ring or a 5- to 7-membered unsaturated heterocyclic ring. Typical examples of the second ring include azetidine, pyrrolidine, piperidine, piperazine, morpholine, thiomorpholine, homopiperazine, pyrrole, imidazole, pyridine, pyridazine, pyrimidine, pyrazine, tetrahydrofuran and tetrahydropyran. Examples of the resulting heteropolycyclic system include octahydro-pyrrolo[1,2-a]pyrazine and octahydro-pyrrolo[3,4-c]pyrrole. Specific examples of the heteropolycyclic system include the following structures:

-continued

Examples of a 4- to 7-membered saturated N-containing heterocyclic group as defined above which includes a bridgehead group  $-(CR'_2)_n-$  or  $-(CR'_2)_r-O-(CR'_2)_s-$  as defined above include 3,8-diaza-bicyclo[3.2.1]octane, 2,5-diaza-bicyclo[2.2.1]heptane, 8-aza-bicyclo[3.2.1]octane, 2-aza-bicyclo[2.2.1]heptane, 3,6-diaza-bicyclo[3.1.1]heptane, 6-aza-bicyclo[3.1.1]heptane, 3,9-diaza-bicyclo[4.2.1]nonane and 3-oxa-7,9-diazabicyclo[3.3.1]nonane.

Specific examples of this group include the following structures:

Examples of a group of formula (IIb) as defined above include groups derived from a 4- to 7-membered saturated N-containing heterocyclic group as defined above which is spiro-fused at any available ring carbon atom to a 3- to 12-membered saturated carbocyclic ring, typically to a 3- to 6-membered saturated carbocyclic ring, or to a 4- to 7-membered saturated N-containing heterocyclic group. Examples include a group selected from azetidine, pyrrolidine, piperidine and piperazine which is spiro-fused at a ring carbon atom to a group selected from cyclopropane, cyclobutane, cyclopentane, cyclohexane, azetidine, pyrrolidine, piperidine, piperazine and tetrahydropyran.

8

- (g) The group of formula (IIb) may, for instance, be a group derived from 3,9-diazaspiro[5.5]undecane, 2,7-diazaspiro[3.5]nonane, 2,8-diazaspiro[4.5]decane or 2,7-diazaspiro[4.4]nonane. Specific examples of a group of formula (IIb) include the following structures:

(xii')

$R^4$  is an indolyl group which is unsubstituted or substituted. The indolyl group may be linked to the thienopyrimidine core via any available ring position. It may, for instance, be an indol-4-yl, indol-5-yl, indol-6-yl or indol-7-yl group. Typically it is indol-4-yl or indol-6-yl, more typically an indol-4-yl group.

When substituted, the indolyl may be substituted at one or more available ring positions. Typically it bears a substituent on the benzene moiety of the indole group. For instance, an indol-4-yl group is typically substituted at the 5-, 6- or 7-position, more typically at the 5- or 6-position. An indol-5-yl group is typically substituted at the 4-, 6- or 7-position, more typically at the 4- or 6-position. An indol-6-yl group is typically substituted at the 4-, 5- or 7-position, more typically at the 4- or 5-position. An indol-7-yl group is typically substituted at the 4-, 5- or 6-position, more typically at the 5- or 6-position.

When the indolyl group is substituted it may be substituted by a group Z or  $R^5$  as defined above. In a typical embodiment the indolyl group is substituted by a group selected from R,  $-OR$ ,  $-SR$ ,  $-S(O)_pR$ ,  $CH_2OR$ ,  $-C(O)R$ ,  $-CO_2R$ ,  $CF_3$ ,  $CF_2OH$ ,  $CH(CF_3)OH$ ,  $C(CF_3)_2OH$ ,  $-(CH_2)_qOR$ ,  $-(CH_2)_qNR_2$ ,  $-C(O)N(R)_2$ ,  $-NR_2$ ,  $-N(R)C(O)R$ ,  $-S(O)_pN(R)_2$ ,  $-OC(O)R$ ,  $OC(O)N(R)_2$ ,  $-N(R)S(O)_pR$ ,  $-NRC(O)N(R)_2$ , CN, halo,  $-NO_2$  and a 5-membered heteroaryl group containing 1, 2, 3 or 4 heteroatoms selected from O, N and S, wherein R, p and q are as defined above in the definition of Z. In another typical embodiment the indolyl group is substituted by a group selected from  $C_1$ - $C_6$  alkyl, CN, halo,  $-C(O)NR_2$ , halo( $C_1$ - $C_6$ )alkyl such as  $CF_3$ ,  $NO_2$ , OR, SR,  $NR_2$ ,  $C(O)R$ , SOR,  $SO_2R$ ,  $SO_2NR_2$ ,  $NRC(O)R$ ,  $CO_2R$  and a 5-membered heteroaryl group as defined above. In another more typical embodiment the indolyl group is substituted by a group selected from CN, halo,  $-C(O)NR_2$ , halo( $C_1$ - $C_6$ )alkyl such as  $CF_3$ ,  $-SO_2R$ ,  $-SO_2NR_2$ , and a 5-membered heteroaryl group containing 1, 2, 3 or 4 heteroatoms selected from O, N and S. In the above embodiments R is typically H or  $C_1$ - $C_6$  alkyl.

Typically the substituent on the indolyl group is an electron-withdrawing group. When the substituent is a 5-membered heteroaryl group it may be, for example, furan, thiophene, pyrrole, imidazole, pyrazole, triazole, tetrazole, oxazole, isoxazole, oxadiazole, thiazole, isothiazole, or thiazadiazole.

In one embodiment a substituted indolyl group is an indol-4-yl group substituted at the 5- or 6-position, in particular the 5-position, by CN, halo,  $-C(O)NH_2$ ,  $-CF_3$ ,  $-SO_2Me$ ,  $-SO_2NMe_2$  or a 5-membered heteroaryl group as defined above. Typically the indol-4-yl group is substituted at the 5- or 6-position by halo, in particular by F. More typically the indol-4-yl group is substituted at the 5-position by halo, in particular by F.

The parameter m in formula (I) is 0, 1 or 2. Typically m is 1 or 2. More typically m is 1.

When, in above definition (a) of A, the homopiperazine, piperazine, piperidine, pyrrolidine, morpholine or azetidine group is optionally substituted by one or more substituents, it

10

is substituted on a ring carbon atom or a ring heteroatom by one or more groups Z or  $R^5$  as defined above. Typical examples of the substituent include halo, oxo ( $=O$ ),  $-C(O)-N(R^{10})_2$  and  $-C(R^{10})_2-OR^{10}$  wherein  $R^{10}$  is H or unsubstituted  $C_1$ - $C_6$  alkyl. Examples of  $-C(O)-N(R^{10})_2$  include  $-C(O)-N(CH_3)_2$  and  $-C(O)-NH_2$ . Examples of  $-C(R^{10})_2-OR^{10}$  include  $-CH_2-OH$  and  $-CH_2-OCH_3$ .

When, in above definition (b) of A, the heteropolycyclic ring system is substituted, it is substituted on a ring carbon atom or a ring heteroatom by one or more groups Z or  $R^5$  as defined above. Typical examples of the substituent include oxo  $-C(O)-N(R^{10})_2$ ,  $-C(O)OR^{10}$  and  $-S(O)_2R^{10}$  wherein  $R^{10}$  is as defined above. Examples of the substituent  $-C(O)-N(R^{10})_2$  include  $-C(O)-NH_2$ ,  $-C(O)NH(CH_3)$  and  $-C(O)N(CH_3)_2$ . Examples of  $-C(O)R^{10}$  include  $-C(O)CH_3$ . Examples of  $-C(R^{10})_2-OR^{10}$  include  $-CH_2-OH$  and  $-CH_2-OCH_3$ . Examples of the substituent  $-C(O)OR^{10}$  include  $-C(O)OH$  and  $-C(O)OCH_3$ . A typical example of  $-S(O)_2R^{10}$  is  $-S(O)_2CH_3$ .

When, in above definition (d) of A, the ring B or B' is substituted, it is substituted on a ring carbon atom or a ring heteroatom by one or more groups Z or  $R^5$  as defined above. Typical examples of the substituent include halo,  $C_1$ - $C_6$  alkyl,  $-C(O)-N(R^{10})_2$ ,  $-C(O)R^{10}$ ,  $-C(O)OR^{10}$  and  $-S(O)_2R^{10}$  wherein  $R^{10}$  is as defined above. Examples of the substituent  $-C(O)-N(R^{10})_2$  include  $-C(O)-NH_2$ ,  $-C(O)NH(CH_3)$  and  $-C(O)N(CH_3)_2$ . Examples of  $-C(O)R^{10}$  include  $-C(O)CH_3$ .  $-C(R^{10})_2-OR^{10}$  include  $-CH_2-OH$  and  $-CH_2-OCH_3$ . Examples of the substituent  $-C(O)OR^{10}$  include  $-C(O)OH$  and  $-C(O)OCH_3$ . A typical example of  $-S(O)_2R^{10}$  is  $-S(O)_2CH_3$ .

The thiophene ring W in formula (I) adopts either of the two available regiochemical orientations. Thus, in one embodiment the thienopyrimidine is of the following formula (Ia):

(Ia)

wherein  $R^1$ ,  $R^2$ ,  $R^3$ ,  $R^4$  and m are as defined above for formula (I).

In a second embodiment the thienopyrimidine is of the following formula (Ib):

(Ib)

wherein  $R^1$ ,  $R^2$ ,  $R^3$ ,  $R^4$  and m are as defined above for formula (I).

Specific examples of compounds of the invention include the compound listed in the following Table 1:

Synthetic strategies for producing thienopyrimidines of formula (I) via suitable precursor compounds, and the production of those precursors, is depicted in the synthetic schemes 1 to 13 which follow in the Examples section.

One suitable synthetic strategy for producing a thienopyrimidine of formula (I) employs the precursor carboxaldehyde of formula (II):

wherein W is as defined above. Starting from this precursor the synthesis comprises performing, in either order, a reductive amination and a palladium-mediated (Suzuki-type) cross-coupling reaction.

A compound of the invention may thus be produced by a process which comprises treating a compound of formula (II):

wherein W is as defined above, with an amine of formula  $\text{NHR}^{1a}\text{R}^{2a}$  in which  $\text{R}^{1a}$  and  $\text{R}^{2a}$  are as defined above for  $\text{R}^1$  and  $\text{R}^2$ , or  $\text{R}^{1a}$  and  $\text{R}^{2a}$  are as defined above for  $\text{R}^1$  and  $\text{R}^2$  wherein an N atom is present and is protected by an amine protecting group, in the presence of a suitable reducing agent; treating the resulting compound of formula (N):

wherein W,  $\text{R}^{1a}$  and  $\text{R}^{2a}$  are as defined above, with a boronic acid or ester thereof of formula  $\text{R}^4\text{B}(\text{OR}^{15})_2$  in which  $\text{R}^4$  is selected from a group  $\text{R}^4$  as defined above and a group  $\text{R}^4$  as defined above in which the indole N atom is protected, and each  $\text{R}^{15}$  is H or  $\text{C}_1\text{-C}_6$  alkyl or the two groups  $\text{OR}^{15}$  form,

## 60

catalyst; and, if  $\text{R}^{4'}$ ,  $\text{R}^{1a}$  and/or  $\text{R}^{2a}$  includes an amine protecting group, removing the protecting group. Any suitable amine protecting groups may be used in  $\text{R}^{1a}$  and/or  $\text{R}^{2a}$ , for instance a t-butoxycarbonyl (BOC) group. Any suitable group may be used to protect the indole N atom, for instance a t-butyltrimethylsilyl group.

A compound of formula (I) may also be produced by a process which comprises treating a compound of formula (II):

wherein W is as defined above, with a boronic acid or ester thereof of formula  $\text{R}^4\text{B}(\text{OR}^{15})_2$  in which  $\text{R}^4$  is as defined above and each  $\text{R}^{15}$  is H or  $\text{C}_1\text{-C}_6$  alkyl, or the two groups  $\text{OR}^{15}$  form, together with the boron atom to which they are attached, a pinacolato boronate ester group, in the presence of a Pd catalyst; treating the resulting compound of formula (III):

wherein W and  $\text{R}^4$  are as defined above, with an amine of formula  $\text{NHR}^{1a}\text{R}^{2a}$  in which  $\text{R}^{1a}$  and  $\text{R}^{2a}$  are as defined above, in the presence of a suitable reducing agent; and, if  $\text{R}^{1a}$  and/or  $\text{R}^{2a}$  includes an amine protecting group, removing the protecting group. In this embodiment of the process the N atom of the indole group  $\text{R}^4$  may, if necessary, be protected before the compound of formula (III) is treated with the amine of formula  $\text{NHR}^{1a}\text{R}^{2a}$ . In that case the indole protecting group is removed in a subsequent step, using conventional methodology.

Both the reductive amination step and the Pd-mediated cross-coupling step take place under conventional conditions. The palladium catalyst may be any that is typically used for Suzuki-type cross-couplings, such as  $\text{PdCl}_2(\text{PPh}_3)_2$ . The reducing agent in the amination step is typically a borohydride, for instance  $\text{NaBH}(\text{OAc})_3$ ,  $\text{NaBH}_4$  or  $\text{NaCNBH}_3$ , in particular  $\text{NaBH}(\text{OAc})_3$ .

Alternatively, a compound of formula (I) may also be produced by a process which comprises treating a compound of formula (II) as defined above with a reducing agent, to reduce the  $\text{-CHO}$  functionality to  $\text{-CH}_2\text{OH}$ , and then treating the resulting compound with an agent which converts the OH moiety into a leaving group, thereby yielding a compound of formula (V):

61

wherein L is a leaving group. Suitable examples of leaving groups include chloro, bromo, tosylate and mesylate groups. The compound of formula (V) is then treated with an amine of formula  $\text{NHR}^{1a}\text{R}^{2a}$  in which  $\text{R}^{1a}$  and  $\text{R}^{2a}$  are as defined above, in the presence of a base such as potassium carbonate or cesium carbonate in a solvent such as DMF, to yield a compound of formula (I). This strategy is depicted in scheme 6 which follows.

A variation in the synthetic strategy for producing a thienopyrimidine of formula (I) entails attaching the group  $\text{R}^4$  to the thienopyrimidine core by Suzuki coupling and then protecting the indole N atom of the group  $\text{R}^4$ . The process comprises treating a compound of formula (VI):

in which W is as defined above, P is a toluenesulfonyl group and  $\text{R}^{4a}$  is a group  $\text{R}^4$  as defined above in which the indole N atom is protected by toluenesulfonyl, with a compound  $\text{NHR}^{1a}\text{R}^{2a}$  as defined above under suitable conditions. The indole N atom is protected by any suitable protecting group, for instance a toluenesulfonyl group. All protecting groups are removed subsequently, using conventional methodology. This strategy is illustrated in scheme 8 which follows.

Thienopyrimidines of formula (I) may be converted into pharmaceutically acceptable salts, and salts may be converted into the free compound, by conventional methods. Pharmaceutically acceptable salts include salts of inorganic acids such as hydrochloric acid, hydrobromic acid and sulfuric acid, and salts of organic acids such as acetic acid, oxalic acid, malic acid, methanesulfonic acid, trifluoroacetic acid, benzoic acid, citric acid and tartaric acid. In the case of compounds of the invention bearing a free carboxy substituent, the salts include both the above-mentioned acid addition salts and the salts of sodium, potassium, calcium and ammonium. The latter are prepared by treating the free thienopyrimidine of formula (I), or an acid addition salt thereof, with the corresponding metal base or ammonia.

Compounds of the present invention have been found in biological tests to be inhibitors of PI3 kinase. The compounds are selective for the p110 $\delta$  isoform, which is a class Ia PI3 kinase, over other class Ia PI3 kinases. They are thus selective for the p110 $\delta$  isoform over both the p110 $\alpha$  isoform and the p110 $\beta$  isoform. In particular they are selective for p110 $\delta$  over

62

p110 $\beta$ . The compounds are also selective for the p110 $\delta$  isoform over p110 $\gamma$ , which is a class Ib kinase. The selectivity exhibited by compounds of the invention for p110 $\delta$  over other isoforms of PI3 kinase is at least 2-fold. Typically the selectivity is 5-fold, or 10-fold, or 20-fold, or 50-fold, rising to 100-fold or higher in many cases. Thus the compounds may be 2-fold, 5-fold, 10-fold, 20-fold, 50-fold or 100-fold selective for p110 $\delta$  over p110 $\beta$ . They may also be 2-fold, 5-fold, 10-fold, 20-fold, 50-fold or 100-fold selective for p110 $\delta$  over p110 $\alpha$  or over p110 $\gamma$ .

A compound of the present invention may be used as an inhibitor of PI3 kinase, in particular of a class Ia PI3 kinase. Accordingly, a compound of the present invention can be used to treat a disease or disorder arising from abnormal cell growth, function or behaviour associated with PI3 kinase, in particular the p110 $\delta$  isoform of PI3 kinase. Examples of such diseases and disorders are discussed by Drees et al in Expert Opin. Ther. Patents (2004) 14(5):703-732. These include proliferative disorders such as cancer, immune disorders, cardiovascular disease, viral infection, inflammation, metabolism/endocrine disorders and neurological disorders. Examples of metabolism/endocrine disorders include diabetes and obesity. Examples of cancers which the present compounds can be used to treat include leukaemia, brain tumours, renal cancer, gastric cancer and cancer of the skin, bladder, breast, uterus, lung, colon, prostate, ovary and pancreas.

A compound of the present invention may be used as an inhibitor of PI3 kinase. A human or animal patient suffering from a disease or disorder arising from abnormal cell growth, function or behaviour associated with PI3 kinase, in particular with the p110 $\delta$  isoform of PI3 kinase such as an immune disorder, cardiovascular disease, viral infection, inflammation, a metabolism/endocrine disorder or a neurological disorder, may thus be treated by a method comprising the administration thereto of a compound of the present invention as defined above. A human or animal patient suffering from cancer may also be treated by a method comprising the administration thereto of a compound of the present invention as defined above. The condition of the patient may thereby be improved or ameliorated.

A compound of the present invention can be administered in a variety of dosage forms, for example orally such as in the form of tablets, capsules, sugar- or film-coated tablets, liquid solutions or suspensions or parenterally, for example intramuscularly, intravenously or subcutaneously. The compound may therefore be given by injection or infusion.

The dosage depends on a variety of factors including the age, weight and condition of the patient and the route of administration. Daily dosages can vary within wide limits and will be adjusted to the individual requirements in each particular case. Typically, however, the dosage adopted for each route of administration when a compound is administered alone to adult humans is 0.0001 to 50 mg/kg, most commonly in the range of 0.001 to 10 mg/kg, body weight, for instance 0.01 to 1 mg/kg. Such a dosage may be given, for example, from 1 to 5 times daily. For intravenous injection a suitable daily dose is from 0.0001 to 1 mg/kg body weight, preferably from 0.0001 to 0.1 mg/kg body weight. A daily dosage can be administered as a single dosage or according to a divided dose schedule.

A compound of the invention is formulated for use as a pharmaceutical or veterinary composition also comprising a pharmaceutically or veterinarily acceptable carrier or diluent. The compositions are typically prepared following conventional methods and are administered in a pharmaceutically or veterinarily suitable form. The compound may be administered in any conventional form, for instance as follows:

A) Orally, for example, as tablets, coated tablets, dragees, troches, lozenges, aqueous or oily suspensions, liquid solutions, dispersible powders or granules, emulsions, hard or soft capsules, or syrups or elixirs. Compositions intended for oral use may be prepared according to any method known in the art for the manufacture of pharmaceutical compositions and such compositions may contain one or more agents selected from the group consisting of sweetening agents, flavouring agents, colouring agents and preserving agents in order to provide pharmaceutically elegant and palatable preparations.

Tablets contain the active ingredient in admixture with non-toxic pharmaceutically acceptable excipients which are suitable for the manufacture of tablets. These excipients may be for example, inert diluents, such as calcium carbonate, sodium carbonate, lactose, dextrose, saccharose, cellulose, corn starch, potato starch, calcium phosphate or sodium phosphate; granulating and disintegrating agents, for example, maize starch, alginic acid, alginates or sodium starch glycolate; binding agents, for example starch, gelatin or acacia; lubricating agents, for example silica, magnesium or calcium stearate, stearic acid or talc; effervescing mixtures; dyestuffs, sweeteners, wetting agents such as lecithin, polysorbates or lauryl sulphate. The tablets may be uncoated or they may be coated by known techniques to delay disintegration and adsorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or glyceryl distearate may be employed. Such preparations may be manufactured in a known manner, for example by means of mixing, granulating, tableting, sugar coating or film coating processes.

Formulations for oral use may also be presented as hard gelatin capsules wherein the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules wherein the active ingredient is present as such, or mixed with water or an oil medium, for example, peanut oil, liquid paraffin, or olive oil.

Aqueous suspensions contain the active materials in admixture with excipients suitable for the manufacture of aqueous suspensions. Such excipients are suspending agents, for example, sodium carboxymethylcellulose, methylcellulose, hydroxypropylmethyl-cellulose, sodium alginate, polyvinylpyrrolidone gum tragacanth and gum acacia; dispersing or wetting agents may be naturally-occurring phosphatides, for example lecithin, or condensation products of an alkylene oxide with fatty acids, for example polyoxyethylene stearate, or condensation products of ethylene oxide with long chain aliphatic alcohols, for example heptadecaethyleneoxycetanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or condensation products of ethylene oxide with partial esters derived from fatty acids and hexitol anhydrides for example polyoxyethylene sorbitan monooleate.

The said aqueous suspensions may also contain one or more preservatives, for example, ethyl or n-propyl p-hydroxybenzoate, one or more colouring agents, such as sucrose or saccharin.

Oily suspension may be formulated by suspending the active ingredient in a vegetable oil, for example arachis oil, olive oil, sesame oil or coconut oil, or in a mineral oil such as liquid paraffin. The oily suspensions may contain a thickening agent, for example beeswax, hard paraffin or cetyl alcohol.

Sweetening agents, such as those set forth above, and flavouring agents may be added to provide a palatable oral preparation. These compositions may be preserved by this addition of an antioxidant such as ascorbic acid. Dispersible powders and granules suitable for preparation of an aqueous suspension by the addition of water provide the active ingredient in admixture with a dispersing or wetting agent, a suspending agent and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned above. Additional excipients, for example sweetening, flavouring and colouring agents, may also be present.

The pharmaceutical compositions of the invention may also be in the form of oil-in-water emulsions. The oily phase may be a vegetable oil, for example olive oil or arachis oils, or a mineral oil, for example liquid paraffin or mixtures of these. Suitable emulsifying agents may be naturally-occurring gums, for example gum acacia or gum tragacanth, naturally occurring phosphatides, for example soy bean lecithin, and esters or partial esters derived from fatty acids and hexitol anhydrides, for example sorbitan mono-oleate, and condensation products of the said partial esters with ethylene oxide, for example polyoxyethylene sorbitan monooleate. The emulsion may also contain sweetening and flavouring agents. Syrups and elixirs may be formulated with sweetening agents, for example glycerol, sorbitol or sucrose. In particular a syrup for diabetic patients can contain as carriers only products, for example sorbitol, which do not metabolise to glucose or which only metabolise a very small amount to glucose.

Such formulations may also contain a demulcent, a preservative and flavouring and coloring agents.

B) Parenterally, either subcutaneously, or intravenously, or intramuscularly, or intrasternally, or by infusion techniques, in the form of sterile injectable aqueous or oleaginous suspensions. This suspension may be formulated according to the known art using those suitable dispersing or wetting agents and suspending agents which have been mentioned above. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic pharmaceutically-acceptable diluent or solvent, for example as a solution in 1,3-butane diol.

Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition fatty acids such as oleic acid find use in the preparation of injectables.

C) By inhalation, in the form of aerosols or solutions for nebulizers.

D) Rectally, in the form of suppositories prepared by mixing the drug with a suitable non-irritating excipient which is solid at ordinary temperature but liquid at the rectal temperature and will therefore melt in the rectum to release the drug. Such materials are cocoa butter and poly-ethylene glycols.

E) Topically, in the form of creams, ointments, jellies, collyriums, solutions or suspensions.

The invention will be further described in the Examples which follow:

## General Experimental Details:

## NMR Spectroscopy

NMR spectra were obtained on a Varian Unity Inova 400 spectrometer with a 5 mm inverse detection triple resonance probe operating at 400 MHz or on a Bruker Avance DPX 400 spectrometer with a 5 mm inverse detection triple resonance TXI probe operating at 400 MHz or on a Bruker Avance DPX 300 spectrometer with a standard 5 mm dual frequency probe operating at 300 MHz. Shifts are given in ppm relative to tetramethylsilane.

## Purification by Column Chromatography:

Compounds purified by column chromatography were purified using silica gel or Isolute® cartridge or Redisep® cartridge, eluting with gradients from 100-0 to 0-100% of cyclohexane/EtOAc, or from 100-0 to 0-100% pentane/EtOAc or from 100-0 to 70-30% DCM/MeOH (with or without the addition of  $\text{NH}_3$  0.1%). 'Silica gel' refers to silica gel for chromatography, 0.035 to 0.070 mm (220 to 440 mesh) (e.g. Fluka silica gel 60), and an applied pressure of nitrogen up to 10 p.s.i accelerated column elution. Where thin layer chromatography (TLC) has been used, it refers to silica gel TLC using plates, typically 3x6 cm silica gel on aluminium foil plates with a fluorescent indicator (254 nm), (e.g. Fluka 60778).

## Purification by Preparative HPLC:

Compounds purified by preparative HPLC were purified using a C18-reverse-phase column (100x22.5 mm i.d Genesis

78

column with 7  $\mu\text{m}$  particle size, UV detection at 230 or 254 nm, flow 5-15 mL/min), or a Phenyl-Hexyl column (250x21.2 mm i.d. Gemini column with 5  $\mu\text{m}$  particle size, UV detection at 230 or 254 nm, flow 5-20 mL/min), eluting with gradients from 100-0 to 0-100% water/acetonitrile or water/MeOH containing 0.1 TFA or water/acetonitrile containing 0.1% formic acid. The free base was liberated by partitioning between EtOAc and a saturated solution of sodium bicarbonate. The organic layer was dried ( $\text{MgSO}_4$ ) and concentrated in vacuo. Alternatively, the free base was liberated by passing through an Isolute® SCX-2 cartridge, eluting with  $\text{NH}_3$  in methanol.

## Microwave Reactions:

Microwave experiments were carried out using a Smith Synthesiser or a Biotage Initiator™, which uses a single-mode resonator and dynamic field tuning, both of which give reproducibility and control. Temperatures from 40-250° C. can be achieved and pressures of up to 20 bar can be reached.

All solvents and commercial reagents were used as received. Non-commercially available reagents/reactants were prepared according to procedures described in the literature.

## General Synthetic Strategies

## Reference Example 1

## Formation of Boronate Esters

The boronate ester formed in scheme 1 was prepared as follows. To a solution of halide (1 eq.) and bis(pinacolato) diboron (1.3 eq.) in DMSO were added KOAc (3 eq.) and [1,1'-bis(diphenylphosphine)ferrocene]dichloropalladium (0.05 eq.). The mixture was heated at 90° C. until completion of the reaction. The reaction mixture was partitioned between EtOAc and H<sub>2</sub>O. The organic layer was washed successively with H<sub>2</sub>O and brine, dried over Na<sub>2</sub>SO<sub>4</sub> and evaporated to dryness. The resultant residue was then purified by column chromatography.

## Suzuki Coupling

The Suzuki coupling reactions depicted generally in schemes 19 and 20 below were performed using one of the methods set out below. When R1=H in these methods, indole boronic acid was used as the reagent.

Scheme 19

Scheme 20

## Method A

A mixture of the appropriate 2-chloro-thienopyrimidine (1 eq.), Cs<sub>2</sub>CO<sub>3</sub> (1.5-2 eq.), indole boronate ester (1.2-1.5 eq.) or indole boronic acid (1.2 eq.) and tetrakis-(triphenylphosphine)palladium (0.05-0.1 eq.) in dioxane/water (3:1 or 2:1) was heated at 125° C.-140° C., for between 10 and 50 min in a microwave reactor (Smith synthesiser or CEM Discover). The resulting mixture was diluted with water then extracted with ethyl acetate. The combined organic extracts were dried (MgSO<sub>4</sub>), filtered and concentrated then purified by either preparative HPLC or column chromatography to give the desired product. Alternatively, the reaction mixture was loaded onto an Isolute® SCX-2 cartridge, washed with MeOH then eluted with 2 M NH<sub>3</sub> in MeOH. The resulting residue was then purified by either preparative HPLC or column chromatography to give the desired product.

## Method B

A mixture of the appropriate 2-chloro-thienopyrimidine (1 eq.), Na<sub>2</sub>CO<sub>3</sub> (2 eq.), indole boronate ester or indole boronic acid (1.5 eq.) and bis(triphenylphosphine)palladium (II) chloride (0.1 eq.) in acetonitrile/water (2:1) was heated at 140° C. for 20-50 min in a microwave reactor (Smith synthesiser or CEM Discover). The resulting mixture was diluted with water then extracted with ethyl acetate. The combined organic extracts were dried (MgSO<sub>4</sub>), filtered and concentrated then purified by either preparative HPLC or column chromatography to give the desired product. Alternatively, the reaction mixture was loaded onto an Isolute® SCX-2 cartridge, washed with MeOH then eluted with 2 M NH<sub>3</sub> in MeOH. The resulting residue was then purified by either preparative HPLC or column chromatography to give the desired product.

## Method C

A mixture of the appropriate 2-chloro-thienopyrimidine (1 eq.), Na<sub>2</sub>CO<sub>3</sub> (1.5 eq.), indole boronate ester or indole boronic acid (1.2 eq.) and tetrakis(triphenylphosphine)palladium (0.1 eq.) in acetonitrile/water (2:1) was heated at 140° C., for 10-30 min in a microwave reactor. The resulting mixture was diluted with water then extracted with ethyl acetate. The combined organic extracts were dried (MgSO<sub>4</sub>), filtered and concentrated in vacuo then purified by either preparative HPLC or column chromatography to give the desired product.

uct. Alternatively, the reaction mixture was loaded onto an Isolute® SCX-2 cartridge, washed with MeOH then eluted with 2 M NH<sub>3</sub> in MeOH. The resulting residue was then purified by either preparative HPLC or column chromatography to give the desired product

## Method D

A mixture of the appropriate 2-chloro-thienopyrimidine (0.1-0.2 mmol), K<sub>3</sub>PO<sub>4</sub> (0.5 mL of a 1.27 M aqueous solution), dichlorobis(tricyclohexylphosphine)palladium (II) (0.05 eq.) and indole boronate ester (1.3-1.5 eq.) in dioxane (1 mL) was heated at 125° C. for 20-50 min in a microwave reactor (Smith synthesiser or CEM Discover). The resulting mixture was diluted with water then extracted with ethyl acetate. The combined organic extracts were dried (MgSO<sub>4</sub>), filtered and concentrated then purified by either preparative HPLC or column chromatography to give the desired product. Alternatively, the reaction mixture was loaded onto an Isolute® SCX-2 cartridge, washed with MeOH then eluted with 2 M NH<sub>3</sub> in MeOH. The resulting residue was then purified by either preparative HPLC or column chromatography to give the desired product.

## General Method for BOC-Deprotection

To a solution of the relevant BOC-protected amino-thienopyrimidine in DCM was added TFA and the resulting solution was stirred at RT for 30-180 min. The resulting mixture was diluted with water then extracted with DCM. The combined organic extracts were dried (MgSO<sub>4</sub> or Na<sub>2</sub>SO<sub>4</sub>), filtered and concentrated in vacuo, then purified by either preparative HPLC or column chromatography to give the desired product. Alternatively, the reaction mixture was loaded onto an Isolute® SCX-2 cartridge, washed with MeOH then eluted with 2 M NH<sub>3</sub> in MeOH. The resulting residue was then purified by either preparative HPLC or column chromatography to give the desired product.

## Reference Example 4

## General Method for TBDMS-Deprotection

To a solution of the relevant TBDMS-protected 5-fluoro-1H-indol-4-yl-thienopyrimidine in THF was added TBAF and the resulting solution was stirred at RT for 30 min, then concentrated in vacuo. The resultant residue was purified by either preparative HPLC or column chromatography to give the desired product.

nitro-benzenesulfonyl chloride (9.42 g, 40 mmol) in DCM (60 mL) over 30 min. The resulting mixture was stirred at 0° C. for 30 min before being allowed to warm to RT and stirred overnight. The reaction mixture was diluted with H<sub>2</sub>O (100 mL) and DCM (40 mL), and the layers were separated. The organic layer was washed in succession with water, HCl (aq., 0.1M) and brine before being dried over Na<sub>2</sub>SO<sub>4</sub> and evaporated to dryness to give the title compound as a pale yellow solid (9.13 g, 94%).

To a solution of 4-N,N-trimethyl-3-nitro-benzenesulfonamide (8.57 g, 34.7 mmol) in concentrated sulfuric acid (80 mL) was added 1,3-dibromo-[1,3,5]triazinane-2,4,6-trione (5.97 g, 20.8 mmol) and the orange reaction mixture was stirred at RT for 16 h. A further 2 g of 1,3-dibromo-[1,3,5]triazinane-2,4,6-trione was added and stirring continued for 5 h. The reaction mixture was then poured onto ice and water and stirred for 15 min. The resulting milky/white solid was filtered and washed with H<sub>2</sub>O, before being dissolved in EtOAc. The organic layer was dried over Na<sub>2</sub>SO<sub>4</sub> and evaporated to dryness to give the title compound as a white solid (10.41 g, 93%).

4-Bromo-1H-indole-6-sulfonic acid dimethylamide

To a solution of 3-bromo-4-N,N-trimethyl-5-nitro-benzenesulfonamide (9.15 g, 28.3 mmol) in dioxane (60 mL) was added DMF-DMA (11.3 mL, 84.9 mmol). The deep red reaction mixture was heated at 80° C. for 24 h followed by heating at 90° C. for 16 h. The mixture was cooled to RT and concentrated to 50% of the volume, poured into H<sub>2</sub>O and extracted into EtOAc. The organic layer was isolated and washed with H<sub>2</sub>O, then brine, dried over Na<sub>2</sub>SO<sub>4</sub>, and evaporated to dryness to give 3-bromo-4-(2-dimethylamino-vinyl)-N,N-dimethyl-5-nitro-benzenesulfonamide as a red solid (10.4 g, 91%). To a suspension of the amide (10.4 g, 25.7 mmol) and Raney®-Nickel (suspension in H<sub>2</sub>O, 20 mL) in MeOH:THF (1:1, 200 mL) was added hydrazine monohydrate (1.9 mL, 38.6 mmol) at 0° C. and the mixture stirred at RT for 40 min.

The reaction mixture was then filtered through Celite and the filter cake washed with EtOAc and H<sub>2</sub>O. The aqueous layer was isolated and then extracted with EtOAc. The combined organic layers were washed with H<sub>2</sub>O, followed by brine, dried over Na<sub>2</sub>SO<sub>4</sub> then evaporated to dryness. The resulting pink solid was purified by column chromatography, and subsequently recrystallised from iPrOH and EtOH to give the title compound as a white solid (3.5 g, 41%).

## 5-Fluoro-4-(4,4,5,5-tetramethyl-[1,3,2]dioxaborolan-2-yl)-1H-indole

A solution of 5-fluoroindole (5 g, 37.0 mmol) in DMF (40 mL) was treated at 0° C. with trifluoroacetic anhydride (6.1 mL, 42.6 mmol). After 30 min, the reaction was poured into water and the resulting precipitate collected by filtration, washed with water, then dried in vacuo. The solid was then dissolved in 10% aqueous NaOH (200 mL) and heated at reflux for 1 h. The reaction mixture was then cooled, washed with dichloromethane and acidified with aqueous HCl. The resulting white precipitate was collected by filtration, washed with water, taken up in dichloromethane, washed with water, dried ( $MgSO_4$ ) and evaporated in vacuo. The resulting material (5 g, 75%) was dissolved in methanol (80 mL) and treated with concentrated sulphuric acid (2 mL) then heated at reflux overnight. The reaction was cooled and the resulting precipitate collected, washed with water and evaporated in vacuo to give 5-fluoro-1H-indole-3-carboxylic acid methyl ester as a peach-coloured solid (4.5 g, 83%).

A solution of thallium tris(trifluoroacetate) (8.45 g, 15.6 mmol) in TFA (35 mL) was added to a solution of 5-fluoro-1H-indole-3-carboxylic acid methyl ester (2 g, 10.4 mmol) in TFA (10 mL) at room temperature and stirred for 2 h. The reaction mixture was evaporated in vacuo and the resulting residue suspended in water (25 mL) before being treated with a solution of potassium iodide (5.2 g, 31.3 mmol) in water (50 mL). The reaction mixture was treated with dichloromethane (100 mL) and methanol (5 mL) and the resulting precipitate removed by filtration through celite.

The organic layer was separated, washed successively with sodium thiosulfate solution and brine, then dried ( $MgSO_4$ ) and evaporated in vacuo. The resultant material was dissolved in methanol (60 mL) and treated with 40% aqueous NaOH solution (60 mL) then refluxed for 2 h. The reaction mixture was cooled and extracted with DCM/MeOH (ratio 95:5), dried ( $MgSO_4$ ), filtered and evaporated in vacuo to give a crude solid. Purification by column chromatography gave 5-fluoro-4-iodo-1H-indole as a pale brown solid (1.05 g, 39%).

NMR  $\delta_H$  (300 MHz,  $CDCl_3$ ) 6.49-6.52 (m, 1H), 6.95 (apparent dt,  $J=0.4, 8.6$ , 1H), 7.26-7.33 (m, 2H) and 8.35 (s, 1H).

A solution of 5-fluoro-4-iodo-1H-indole (261 mg, 1.0 mmol) in dioxane (1 mL) was treated with triethylamine (0.2 mL, 1.4 mmol), palladium acetate (4.5 mg, 0.02 mmol) and bis(cyclohexyl)phosphino-2-biphenyl (28 mg, 0.08 mmol) then heated to 80° C. A solution of pinacolborane (1 M in

THF, 2.66 mL, 2.66 mmol) was added via syringe. After 30 min, the reaction mixture was cooled, then diluted with water (10 mL) and DCM (10 mL). The resulting mixture was passed through a phase separation cartridge, and the dichloromethane layer was evaporated in vacuo to obtain the title compound which was used without further purification.

4,4,5,5-Tetramethyl-[1,3,2]dioxaborolane (2.1 mL, 14.5 mmol) was added drop-wise to a mixture of 4-bromo-1H-indole-2-carbonitrile (1.27 g, 5.8 mmol), palladium acetate (33 mg, 0.145 mmol), triethylamine (1.21 mL, 8.7 mmol) and 2-(dicyclohexylphosphino)biphenyl (203 mg, 0.58 mmol) in dioxane at 80° C. The reaction mixture was stirred at 80° C. for 5 h then allowed to stand at RT overnight. The reaction mixture was diluted with DCM and washed with water, then the organic layer was isolated, dried (MgSO<sub>4</sub>) then concentrated in vacuo. The resultant crude material was purified by column chromatography to afford the title compound as a brown solid (1.02 g, 66%).

To a solution of 2,3-dihydro-pyrrolo[3,2-c]pyridine-1-carboxylic acid tert-butyl ester (1.0 g, 4.2 mmol) in acetonitrile (20 mL) was added benzyl bromide and the mixture heated at reflux for 2.5 h. The reaction mixture was concentrated in vacuo and the resultant black oil was dissolved in MeOH (50 mL). To this solution was slowly added sodium borohydride (1.2 g, 32.0 mmol) over 10 min, then the mixture was heated at reflux for 2.5 h. After cooling to RT, the reaction mixture was concentrated in vacuo before EtOAc and an aqueous saturated solution of ammonium chloride were added. The reaction mixture was stirred at RT for 1 h. The organic layer

(4R\*,4aR\*)-1-Methyl-hexahydro-pyrido[3,4-b][1,4]oxazin-2-one

To a stirring solution of 1,2,3,6-tetrahydropyridine (2.96 g, 35.6 mmol), in dichloromethane (100 mL) was added portionwise di-tert-butyl dicarbonate (8.54 g, 39.1 mmol) followed by triethylamine (5.46 mL, 39.1 mmol). The reaction mixture was stirred at room temperature overnight and partitioned between dichloromethane and saturated sodium bicarbonate solution. The combined organic layers were washed with brine, separated and dried (MgSO<sub>4</sub>) to give 3,6-dihydro-2H-pyridine-1-carboxylic acid tert-butyl ester as a yellow liquid (6.27 g).

To a stirring solution of 3,6-dihydro-2H-pyridine-1-carboxylic acid tert-butyl ester (6.27 g, 34.2 mmol) in dichloromethane (35 mL) cooled down to 0° C. was added dropwise a solution of m-chloroperoxybenzoic acid (8.65 g, 1.1 eq) in dichloromethane (50 mL). The mixture stirred at room temperature for 4 hours. The mixture was partitioned between dichloromethane and 5% potassium carbonate solution. The combined organic layers were washed with brine, separated and dried (MgSO<sub>4</sub>). The crude product was purified by column chromatography to yield a (±)-7-oxa-3-azabicyclo[4.1.0]heptane-3-carboxylic acid tert-butyl ester (4.43 g) as a pale yellow liquid.

To a stirring solution of (±)-7-oxa-3-aza-bicyclo[4.1.0]heptane-3-carboxylic acid tert-butyl ester (2.4 g, 12.06 mmol) in ethanol (20 mL) was added sodium azide (1.00 g, 15.62 mmol) and ammonium chloride (840 mg, 15.79 mmol). The resulting mixture was heated to reflux overnight and then partitioned between ethyl acetate and water. The combined organic layers were washed with brine, separated and dried (MgSO<sub>4</sub>). The crude product was purified by column chromatography to yield (3R\*,4R\*)-4-azido-3-hydroxy-piperidine-1-carboxylic acid tert-butyl ester (1.95 g) and (3S\*,4S\*)-3-azido-4-hydroxy-piperidine-1-carboxylic acid tert-butyl ester (312 mg).

The structures of these regioisomers were confirmed by COSY-4/HSQC/NOESY/DEPT-Q experiments.

A solution of (3R\*,4R\*)-4-azido-3-hydroxy-piperidine-1-carboxylic acid tert-butyl ester (2.96 g, 12.23 mmol) in ethanol (50 mL) was flushed out with nitrogen. Palladium (10 wt % on activated carbon) (~300 mg) was added and the mixture flushed out with hydrogen and then stirred under a hydrogen balloon at room temperature overnight. The reaction mixture

was filtered through celite and the filtrate evaporated to give (3R\*,4R\*)-4-amino-3-hydroxy-piperidine-1-carboxylic acid tert-butyl ester (2.73 g).

To a stirring solution of (3R\*,4R\*)-4-amino-3-hydroxy-piperidine-1-carboxylic acid tert-butyl ester (2.64 g, 12.22 mmol) in dichloromethane (30 mL) was added triethylamine (1.87 mL, 13.41 mmol) and cooled down to 0° C. Chloroacetyl chloride (0.97 mL, 12.18 mmol) was added dropwise. The mixture was warmed to room temperature and stirred overnight. The mixture was partitioned between dichloromethane and brine. The combined organic layers were washed with brine, separated and dried (MgSO<sub>4</sub>). The crude product was purified by column chromatography to yield (3R\*,4R\*)-4-(2-chloro-acetylamine)-3-hydroxy-piperidine-1-carboxylic acid tert-butyl ester (2.70 g).

To a stirring solution of (3R\*,4R\*)-4-(2-chloro-acetylamine)-3-hydroxy-piperidine-1-carboxylic acid tert-butyl ester (2.70 g, 9.23 mmol) in tetrahydrofuran (30 mL) cooled down to 0° C. was added sodium hydride, 60% dispersion in mineral oil (830 mg, 1.1 eq) portionwise. The mixture was warmed to room temperature and stirred for 6 hours. The mixture was partitioned between dichloromethane and brine. The combined organic layers were washed with brine, separated and dried (MgSO<sub>4</sub>). The crude product was purified by column chromatography to yield (4aR\*,8aR\*)-2-oxo-octahydro-pyrido[3,4-b][1,4]oxazine-6-carboxylic acid tert-butyl ester (1.31 g).

To a stirring solution of (4aR\*,8aR\*)-2-oxo-octahydro-pyrido[3,4-b][1,4]oxazine-6-carboxylic acid tert-butyl ester (700 mg, 2.73 mmol) in dimethylformamide (10 mL) at 0° C. was added sodium hydride, 60% dispersion in mineral oil (180 mg, 1.1 eq). The mixture was stirred at 0° C. for 30 minutes and then iodomethane (0.19 mL, 3.05 mmol) was added. The mixture was warmed to room temperature and stirred overnight.

The mixture was partitioned between ethyl acetate and water. The combined organic layers were washed with brine, separated and dried (MgSO<sub>4</sub>) to yield (4aR\*,8aR\*)-1-methyl-2-oxo-octahydro-pyrido[3,4-b][1,4]oxazine-6-carboxylic acid tert-butyl ester (513 mg). Removal of the Boc-protecting group using 2.0 M HCl in diethyl ether in dichloromethane gave the hydrochloride salt of the title compound as an off-white foam (290 mg).

## Reference Example 115

## 1-[1-(2-Chloro-4-morpholin-4-yl-thieno[3,2-c]pyrimidin-6-ylmethyl)-piperidin-4-yl]-azetidin-3-ol

To a stirred solution of 1-Boc-4-piperidone (1.2 g; 6.0 mmol), 3-hydroxyazetidine (0.43 g; 5.9 mmol) in 1,2-dichloroethane (30 mL) was added  $NaB(OAc)_3H$  (3.81 g; 18.0 mmol). The reaction mixture was stirred at RT overnight (16 h), quenched with saturated  $NaHCO_3$  solution (20 mL), the layers separated (hydrophobic frit) and solvent evaporated. The resulting residue (926 mg; 3.6 mmol) was Boc-protected (TFA/ $CH_2Cl_2$ ) and after evaporation of volatiles 1-piperidin-4-yl-azetidin-3-ol trifluoroacetate was obtained as a thick oil.

To a stirred suspension of 2-chloro-4-morpholin-4-yl-thieno[3,2-d]pyrimidine-6-carbaldehyde (1.13 g; 4.0 mmol) in 1,2-dichloroethane (20 mL) was added a solution of 1-piperidin-4-yl-azetidin-3-ol trifluoroacetate (3.6 mmol) in THF (5 mL) followed by  $NaB(OAc)_3H$  (2.12 g; 10.0 mmol). The reaction mixture was stirred at RT overnight (16 h) and product isolated by acid/base extraction. Purification by ISCO gave the title compound as a white solid (0.50 g; 30%).

## [2-(Tetrahydro-pyran-4-ylamino)-ethyl]-carbamic acid tert-butyl ester

To a solution of (2-amino-ethyl)-carbamic acid tert-butyl ester (5 g, 31.2 mmol) in DCE (150 mL) was added tetrahydro-pyran-4-one (2.7 mg, 27.1 mmol). The mixture was stirred at RT for 1 h, then sodium triacetoxyborohydride (8.63 g, 40.7 mmol) was added and stirring was continued for 18 h. The reaction mixture was diluted with  $NH_4OH$  10% in water and extracted with DCM. The organic layer was separated, dried ( $Na_2SO_4$ ) and concentrated in vacuo to give the title compound as colourless oil (6.60 g, 99%).

## 1-(Tetrahydro-pyran-4-yl)-piperazin-2-one

To a solution of [2-(tetrahydro-pyran-4-ylamino)-ethyl]-carbamic acid tert-butyl ester (6.60 g, 27.0 mmol) in DCM (100 mL) was added triethylamine (11.3 mL, 81.1 mmol) followed by chloroacetyl chloride (3.64 g, 32.4 mmol) dropwise. The reaction mixture was stirred at RT for 24 h, then partitioned between DCM and saturated  $NaHCO_3$  aqueous solution. The organic layer was isolated, dried ( $Na_2SO_4$ ) and concentrated in vacuo. To a solution of the resulting residue in THF (50 mL) was added sodium hydride (60% in mineral oil) (1.62 g, 40.6 mmol). The reaction mixture was stirred at RT for 20 h, then partitioned between DCM and water. The organic layer was dried ( $Na_2SO_4$ ) and concentrated in vacuo to yield an orange residue. The residue (7.66 g, 27.0 mmol) was dissolved in dichloromethane (15 mL) and TFA (15 mL) was added. The resulting solution was stirred at RT for 4 h before being concentrated in vacuo. The resultant residue was loaded onto an Isolute® SCX-2 cartridge, washed with MeOH then eluted with 2 M  $NH_3$  in MeOH to give the title compound as yellow oil (4.26 g, 86%).

## Biological Evaluation and Pharmaceutical Formulations

## Example 99

## Biological Testing

Compounds of the invention, prepared as described in the preceding Examples, were submitted to the following biological assay:

## PI3K Biochemical Screening

Compound inhibition of PI3K was determined in a radiometric assay using purified, recombinant enzyme and ATP at a concentration of 1  $\mu$ M. All compounds were serially diluted in 100% DMSO. The kinase reaction was incubated for 1 hour at room temperature, and the reaction was terminated by the addition of PBS. IC<sub>50</sub> values were subsequently determined using sigmoidal dose-response curve fit (variable slope). All of the compounds tested had an IC<sub>50</sub> against PI3K of 50  $\mu$ M or less. Typically the IC<sub>50</sub> against the p110 $\delta$  isoform of PI3K was less than 500 nM.

## Example 100

## Tablet Composition

Tablets, each weighing 0.15 g and containing 25 mg of a compound of the invention were manufactured as follows:

## 168

## Composition for 10,000 tablets

Compound of the invention (250 g)

Lactose (800 g)

Corn starch (415 g)

5 Talc powder (30 g)

Magnesium stearate (5 g)

The compound of the invention, lactose and half of the corn starch were mixed. The mixture was then forced through a sieve 0.5 mm mesh size. Corn starch (10 g) is suspended in warm water (90 ml). The resulting paste was used to granulate the powder. The granulate was dried and broken up into small fragments on a sieve of 1.4 mm mesh size. The remaining quantity of starch, talc and magnesium was added, carefully mixed and processed into tablets.

## Example 101

## Injectable Formulation

Compound of the invention	200 mg
Hydrochloric Acid Solution 0.1 M or Sodium Hydroxide Solution 0.1 M q.s. to pH	4.0 to 7.0
Sterile water q.s. to	10 ml

The compound of the invention was dissolved in most of the water (35°-40° C.) and the pH adjusted to between 4.0 and 7.0 with the hydrochloric acid or the sodium hydroxide as appropriate. The batch was then made up to volume with water and filtered through a sterile micropore filter into a sterile 10 ml amber glass vial (type 1) and sealed with sterile closures and overseals.

## Example 102

## Intramuscular Injection

Compound of the invention	200 mg
Benzyl Alcohol	0.10 g
Glycofurol 75	1.45 g
Water for injection q.s to	3.00 ml

The compound of the invention was dissolved in the glycofurol. The benzyl alcohol was then added and dissolved, and water added to 3 ml. The mixture was then filtered through a sterile micropore filter and sealed in sterile 3 ml glass vials (type 1).

## Example 103

## Syrup Formulation

Compound of invention	250 mg
Sorbitol Solution	1.50 g
Glycerol	2.00 g
Sodium benzoate	0.005 g
Flavour	0.0125 ml
Purified Water q.s. to	5.00 ml

The compound of the invention was dissolved in a mixture of the glycerol and most of the purified water. An aqueous

solution of the sodium benzoate was then added to the solution, followed by addition of the sorbital solution and finally the flavour. The volume was made up with purified water and mixed well.

The invention claimed is:

1. A compound which is a thienopyrimidine of formula (I):

wherein

W represents a thiophene ring;

R<sup>1</sup> and R<sup>2</sup> form, together with the N atom to which they are attached, a group of the following formula (IIa):

in which A is selected from:

(a) a group selected from homopiperazine, piperazine, piperidine, pyrrolidine and azetidine, which group is substituted by one or more substituents selected from C<sub>3</sub>-C<sub>10</sub> cycloalkyl which is unsubstituted or substituted, an O-containing ring which is tetrahydrofuran, tetrahydropyran or oxetane and which is unsubstituted or substituted, —NR'—(CR'<sub>2</sub>)<sub>r</sub>—X wherein each R' is independently H or C<sub>1</sub>-C<sub>6</sub> alkyl, r is 0 or 1 and X is selected from C<sub>3</sub>-C<sub>10</sub> cycloalkyl which is unsubstituted or substituted, an O-containing ring which is tetrahydrofuran, tetrahydropyran or oxetane and which is unsubstituted or substituted, and a 4-membered saturated N-containing heterocyclic ring which is unsubstituted or substituted, and which group is optionally substituted by one or more further substituents;

(b) a 4- to 7-membered saturated N-containing heterocyclic ring which includes 0 or 1 additional heteroatoms selected from N, S and O, the ring being fused to a second ring selected from a 4- to 7-membered saturated N-containing heterocyclic ring as defined above, a 5- to 12-membered unsaturated heterocyclic ring, a 5- to 7-membered saturated O-containing heterocyclic ring, a 3- to 12-membered saturated carbocyclic ring and an unsaturated 5- to 12-membered carbocyclic ring to form a heteropolycyclic ring system, the heteropolycyclic ring system being unsubstituted or substituted;

(c) a 4- to 7-membered saturated N-containing heterocyclic ring which includes 0 or 1 additional heteroatoms selected from N, S and O and which further comprises, linking two constituent atoms of the ring, a bridgehead group selected from —(CR'<sub>2</sub>)<sub>n</sub>— and —(CR'<sub>2</sub>)<sub>r</sub>—O—(CR'<sub>2</sub>)<sub>s</sub>— wherein each R' is as defined above, n is 1, 2 or 3, r is as defined above and s is 0 or 1, the remaining ring positions being unsubstituted or substituted; and

170

(d) a group of formula (IIb):

wherein ring B is a 4- to 7-membered saturated N-containing heterocyclic ring which includes 0 or 1 additional heteroatoms selected from N, S and O and ring B' is a 3- to 12-membered saturated carbocyclic ring, a 5- to 7-membered saturated O-containing heterocyclic ring or a 4- to 7-membered saturated N-containing heterocyclic ring as defined above, each of B and B' being unsubstituted or substituted;

m is 0, 1 or 2;

R<sup>3</sup> is H or C<sub>1</sub>-C<sub>6</sub> alkyl;

R<sup>a</sup> is selected from R', halo, CN, C(O)NR'<sub>2</sub>, halo(C<sub>1</sub>-C<sub>6</sub>) alkyl, SO<sub>2</sub>R', SO<sub>2</sub>NR'<sub>2</sub>, NR'SO<sub>2</sub>R', NR'C(O)R', NR'C(O)OR', NR'C(O)NR'<sub>2</sub>, OR' and NR'<sub>2</sub>, wherein each R' is independently as defined above; and

R<sup>4</sup> is an indole group which is unsubstituted or substituted; or a pharmaceutically acceptable salt thereof.

2. A compound according to claim 1 wherein the thienopyrimidine is of

wherein R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup> and m are as defined in claim 1.

3. A compound according to claim 1 wherein the thienopyrimidine is of formula (Ib):

wherein R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup> and m are as defined in claim 1.

4. A compound according to claim 1 wherein R<sup>4</sup> is an indole group which is unsubstituted or substituted by a group selected from CN, halo, —C(O)NR<sub>2</sub>, halo(C<sub>1</sub>-C<sub>6</sub>)alkyl, —SO<sub>2</sub>R, —SO<sub>2</sub>NR<sub>2</sub>, and a 5-membered heteroaryl group containing 1, 2, 3 or 4 heteroatoms selected from O, N and S, wherein R is H or C<sub>1</sub>-C<sub>6</sub> alkyl.

5. A compound of claim 1 which is selected from:
