

US008328860B2

## (12) United States Patent

Strauss et al.

US 8,328,860 B2

Dec. 11, 2012

### IMPLANT INCLUDING A COIL AND A STRETCH-RESISTANT MEMBER

Inventors: Brian Michael Strauss, Trabuco Canyon, CA (US); Todd Jeffrey Hewitt, Laguna Niguel, CA (US); Ramon Torres Carillo, Santa Ana, CA (US); Khoa Dang Vu, Santa Ana, CA (US); William Robert Patterson, Irvine, CA (US); Stacy Leon Faught, Aliso Viejo, CA (US); Lawrason Charles Wilbur, Lake Forest, CA (US); Scott William Brennan, Laguna Beach, CA (US);

Assignee: Covidien LP, Mansfield, MA (US) (73)

Subject to any disclaimer, the term of this Notice:

patent is extended or adjusted under 35

Vince Divino, Mission Viejo, CA (US)

#### (57)**ABSTRACT**

This invention is directed to implantable coils and, more particularly, to a coil implant having a stretch-resistant member internal to the coil. The implant of the invention is able to freely articulate and torque prior to delivery. Once delivered, the implant is no longer stretch resistant and is therefore able to substantially conform to the vascular site.

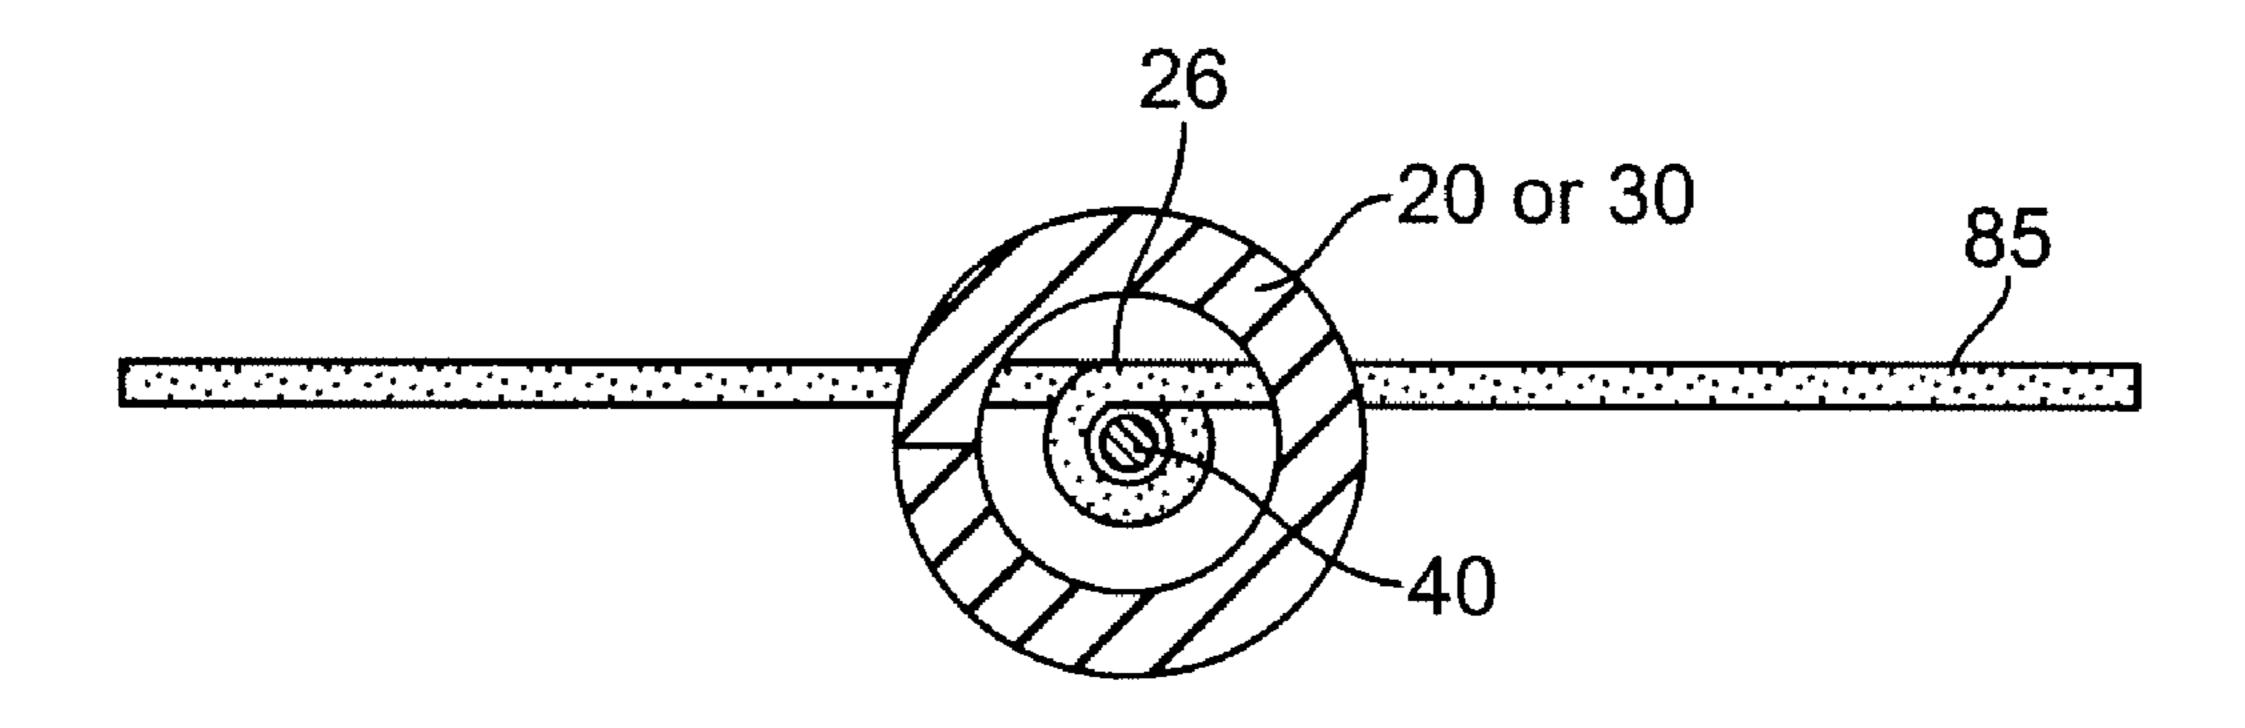

FIG. 8B

## IMPLANT INCLUDING A COIL AND A STRETCH-RESISTANT MEMBER

#### RELATED APPLICATIONS

This application claims the benefit under 35 U.S.C. §119 (e) of provisional application Ser. No. 60/894,589 filed Mar. 13, 2007 and 60/894,858 filed on Mar. 14, 2007, both of which are hereby incorporated by reference in its entirety.

#### FIELD OF THE INVENTION

This invention relates to implantable coils and, more particularly, to a coil implant having a stretch-resistant member internal to the coil.

#### BACKGROUND OF THE INVENTION

Implants are delivered to a vascular site, such as an aneurysm, of a patient via a microcatheter to occlude or embolize 20 the vascular site. Typically, the implant is engaged at the distal end of either the delivery microcatheter or the guidewire contained within the microcatheter and controllably released therefrom into the vascular site to be treated. The clinician delivering the implant must navigate the microcatheter or 25 guide catheter through the vasculature and, in the case of intracranial aneurysms, navigation of the microcatheter is through tortuous microvasculature. This delivery may be visualized by fluoroscopy or another suitable means. Once the distal tip of the catheter or guidewire is placed in the 30 desired vascular site, the clinician must then begin to articulate the implant in the vascular site to ensure that the implant will be positioned in a manner to sufficiently embolize the site. Once the implant is appropriately positioned, the clinician must then detach the implant from the catheter or 35 guidewire without distorting the positioning of the implant. Detachment may occur through a variety of means, including, chemical detachment, mechanical detachment, hydraulic detachment, and thermal detachment.

The procedure of delivering the implant to the vascular site 40 can be complicated for a number of reasons. One common complication found with implants of the art is that the doctor is not able to effectively articulate, rotate, and/or control the implant during positioning in the vascular site to provide sufficient embolization. One reason that the implant may not 45 be able to effectively articulate is that the proximate portion of the implants of the art are often rigid. This portion is referred to as the "stiff zone" and may also contain the detachment mechanism. One drawback of an implant having a "stiff zone" is that this "stiff zone" may cause catheter kick-out 50 after deployment of the implant to the vascular site.

Another complication with implants of the art is that the implant may not be able to substantially conform to the vascular site due the presence of a stretch-resistant member. For example, U.S. Pat. No. 5,582,619 teaches a stretch-resistant member that is fixedly attached at both ends or at one end and then at another point in the lumen of the catheter. Due to the stretch-resistant member being fixedly attached in two locations, the implant, after delivery, will maintain some stretch-resistant properties. If the implant is stretch resistant after 60 delivery, this may inhibit the implant's ability to substantially conform to the vascular site.

Yet another complication with implants of the art is that after detachment, the implant may contain a traumatic (or sharp) portion or stem. This traumatic portion most frequently occurs with implants that are mechanically or electrolytically detached from the delivery device. See, for

2

example, U.S. Publ. 2004/0034363 which describes use of a stretch-resistant member and a loop at the proximal end of the coil. The loop, after deployment, is a traumatic portion. The traumatic portion may cause damage to the patient in the surrounding vasculature. Further, it is also contemplated that due to the presence of the loop, the clinician is not able to torque the implant during delivery therefore making the appropriate placement more difficult.

In light of the above, there exists a need for an implant that maintains the ability to freely articulate and torque without having a "stiff zone," and also for the implant to substantially conform to the vascular site. There also exists a need to have an implant without a traumatic portion or stem after detachment at the vascular site.

#### SUMMARY OF THE INVENTION

The invention is directed to, in one embodiment, an implant with a stretch-resistant member.

The implant further includes a member for engaging a positioning device or a positioner. The member for engaging a positioning device and the stretch-resistant member are coupled together. The member for engaging a positioning device is free to move with respect to the coil thereby allowing for the implant to articulate and be positioned more accurately. In one embodiment, the implant includes a primary coil that defines a lumen disposed on an axis. A proximal end of the primary coil defines a proximal aperture, and a distal end of the primary coil defines a distal aperture. A stretch-resistant member is disposed in the lumen, with a coupling portion of the stretch-resistant member coupled in the lumen to the member for engaging a positioning device that has an engagement portion exterior to the lumen. The stretch-resistant member can be a line, a filament, or a braid.

The implant optionally can include a secondary coil. In one embodiment, the secondary coil is disposed at least in part in the lumen, and that further defines the proximal aperture. The secondary coil is coaxial with the primary coil.

The coupling portion of the stretch-resistant member can be coupled to a distal end of the member for engaging a positioning device which can preferably be an eyelet. The stretch-resistant member can also couple to the engagement member with a wrap or a knot, and can also extend back to the distal end of the primary coil so that two lengths of line extend along the length of the lumen. The line can also have an end that engages a retainer at the distal end of the primary coil. In one embodiment, the retainer is ball-shaped or rounded.

The member for engaging a positioning device can preferably be a rod and have a proximal end with an engagement portion, and the engagement portion can preferably be a ball mounted on the proximal end of the member for engaging a positioning device. The member for engaging a positioning device can also extend through the proximal aperture so that the engagement portion is disposed at the proximal-most end of the implant. The member for engaging a positioning device and the coupling portion of the stretch-resistant member can be freely disposed at the proximal end of the implant so that the member for engaging a positioning device and the coupling portion are not connected to or attached to the primary or secondary coils. Also, the member for engaging a positioning device can have a central axis that intersects the proximal aperture at various points. The member and engagement portion are free to move distally into the lumen of the primary (or primary and secondary) coil. In one embodiment, the member and engagement portion can move distally to be completely in the lumen of the coil.

In another embodiment, the invention is directed to a method of embolizing a vascular site in a patient. The implant is introduced to the vascular site via a positioner and then detached from the positioner thereby embolizing the vascular site. The implant can be detached from the positioner by chemical detachment, electrolytic detachment, mechanical detachment, hydraulic detachment, or thermal detachment. After detachment, the engagement portion is contained within the interior lumen. In one embodiment, the engagement portion is completely contained within the interior lumen.

#### BRIEF DESCRIPTION OF THE DRAWINGS

The accompanying drawings, which are incorporated herein and constitute part of this specification, illustrate exemplary embodiments of the invention, and, together with the general description given above and the detailed description given below, serve to explain the features of the invention.

FIG. 1A is a plan view of an exemplary positioning system and a plan view of an exemplary implant.

FIG. 1B is a closer view of a portion of FIG. 1A.

FIG. 2 is a plan view of a positioning system of FIG. 1 25 within the human body.

FIG. 3 is a partial cross-sectional plan view of the implant of FIG. 1 with an exemplary positioning device.

FIG. 4A is a closer view of a portion of FIG. 2 showing the positioning system in partial cross-section and an exemplary implant in a position within the human body prior to deployment of the implant.

FIG. 4B is a closer view of a portion of FIG. 2 showing the positioning system in partial cross-section and an exemplary implant in another position within the human body after deployment but before detachment.

FIG. **5** is a partial cross-sectional plan view of an implant with a stretch-resistant member in partial cross-section.

FIGS. **6**A and **6**B show an implant of the invention prior to detachment (FIG. **6**A) and after detachment (FIG. **6**B) from the positioner in partial cross-section.

FIG. 7 is a plan view of an embodiment of the stretch-resistant member of FIG. 5.

FIG. **8**A illustrates one embodiment, in plan view, an 45 exemplary wrapping pattern of the fibers around the stretch resistant member.

FIG. **8**B is a cross-sectional view of the wrapping pattern of the fibers around the stretch-resistant member shown in FIG. **8**A.

#### DETAILED DESCRIPTION OF THE INVENTION

Unless defined otherwise, all technical and scientific terms used herein have the same meanings as commonly understood by one of ordinary skill in the art to which this invention belongs. Although any methods and materials similar or equivalent to those described herein can be used in the practice or testing of the present invention, the preferred methods, devices, and materials are now described. All publications 60 and patent applications cited herein are incorporated herein by reference in their entirety. Nothing herein is to be construed as an admission that the invention is not entitled to antedate such disclosure by virtue of prior invention.

It must be noted that as used herein and in the appended 65 claims, the singular forms "a," "an," and "the" include plural references unless the context clearly dictates otherwise.

4

#### Methods of Embolizing a Vascular Site

Prior to describing the embodiments of the implant of the invention, provided below is an embodiment of the invention related to embolizing a vascular site of a patient using an implant.

As illustrated in FIGS. 1A and 1B, the implant of the invention, in one embodiment, may be used with a positioning device 70 that may optionally include an actuator 90 operated by an operator, a positioning tube 76 engaging the actuator 90, and an implant interface 78 at the distal end of the positioning tube 76. A portion of the implant interface 78 engages a complementary portion of an implant 10. The positioning device 70 is more specifically described below in FIG. 3.

In the embodiment illustrated in FIGS. 1A and 1B, an operator uses a guide tube or guide catheter 12 to position a delivery tube or microcatheter 14 in a patient's vasculature, as illustrated in FIG. 2. The procedure involves inserting the guide catheter 12 into the patient's vasculature through an access point such as the groin, and directing the distal end 12a of the guide catheter 12 through the vascular system until it reaches the carotid artery. After removing a guide wire (not shown) from the guide catheter 12, a microcatheter 14 is inserted into the guide catheter 12 and the distal end 14a of the microcatheter 14 subsequently exits the guide catheter distal end 12a and is positioned near the target site 16, such as an aneurysm in the patient's brain.

As illustrated in FIGS. 4A and 4B, the microcatheter 14 includes microcatheter markers 15 and 15a that facilitate imaging of the distal end 14a of the microcatheter 14 with common imaging systems and, in the illustrated embodiment, the microcatheter markers 15 and 15a are made of a radiopaque material. After the distal end 14a reaches the target site 16, the positioning device 70 (as shown in FIG. 1A) of the illustrated embodiment is then inserted into the microcatheter 14 to position the implant interface 78 at the distal end of the positioning device 70 near the target site 16, as illustrated in FIG. 4B.

If the implant 10 is being delivered in the procedure, the implant 10 is attached to the implant interface 78 prior to inserting the positioning device 70 into the microcatheter 14. This mode of implant delivery is illustrated in FIGS. 2 and **4**A-B. The delivery of the implant **10** is facilitated by disposing the microcatheter marker 15a near the target site 16, and aligning the microcatheter marker 15 with a positioner marker 15b in the positioner tube 76 which, when the two markers (markers 15 and 15b) are aligned with each other as illustrated in FIG. 4B, indicates to the operator that the implant interface 78 is in the proper position for the release of the implant 10 from the positioning device 70. After depositing the implant 10 at the target site 16, a second implant 10 can be deposited at the target site 16 by removing the positioning device 70 from the microcatheter 14 and inserting a second positioning device 70 with an attached second implant 10 into the microcatheter 14 in a manner similar to the method used with the insertion of the first implant 10. The same procedure can be used for a third implant 10 and subsequent implants if clinically necessary. If the implant 10 is already in the patient's body to be retrieved or repositioned, the positioning device 70 is inserted into the microcatheter 14 without the implant 10.

As can be seen in FIG. 4A and FIG. 4B, it is advantageous that the implant 10 and positioning device 70 (not shown) have a reduced "stiff zone" at the interface 78 to better allow

delivery through the tortuous vasculature, responsive placement into the target site 16, and for the ability to reposition the implant 10.

#### The Implant and Device Configurations

The implant of the invention maintains a high level of articulation, including the ability to torque, prior to deployment thereby providing responsive placement and repositioning prior to deployment. This level of articulation is partially due to a lack of having or having a very small "stiff zone" in its proximal end. Further and as explained below, in one embodiment, the implant of the invention is stemless after detachment. As a result of the implant being stemless, the level of trauma associated with deployment of an implant in 15 the vasculature is minimized.

Additionally, as described below, the implant of the invention has a stretch-resistant member and this feature eases delivery by allowing the clinician to reposition as necessary without the implant deforming while maintaining its secondary shape. After the implant of the invention is delivered, the implant of the invention no longer retains its "stretch resistance" properties thereby allowing the implant to better substantially conform to the vascular site.

The implant 10 illustrated in FIG. 5 includes a primary coil 25 20, a secondary coil 30, a stretch-resistant member 40, a retainer 50, and a member 60 for engaging a positioning device 70 (shown in FIGS. 1A, 1B, and 3). The member 60 for engaging a positioning device 70 is preferably a rod that includes a ball 62 and an eyelet 64.

The primary coil 20 has a proximal end 22 and a distal end 24 defining an internal lumen 26 extending between the ends of the primary coil. The primary coil 20 can be formed in a variety of shapes once heat setting of the coil form is performed. One such shape of the primary coil can be found in 35 U.S. Ser. No. 12/038,737, filed on even date herewith as attorney docket number 355492-7601 and titled "An implant, a mandrel, and a method of forming an implant." This application is incorporated by reference into its entirety.

The optional secondary coil 30 is disposed at the proximal 40 end 22 of the primary coil 20 and further defines the proximal aperture. In one embodiment, the secondary coil 30 has an outer diameter that is sized to fit within the internal lumen 26 of the primary coil 20 and the primary coil 20 partially envelops the secondary coil 30. In this embodiment, the secondary 45 coil 30 has an outer diameter which is less than the inner diameter of the primary coil **20**. In another embodiment, the secondary coil 30 has an outer diameter equal or less than the outer diameter of the primary coil 20. In another embodiment, the secondary coil 30 is adjacent to the primary coil 20. The 50 secondary coil 30 may be affixed by any means, such as welded, to the proximal end 22 of the primary coil 20 with weld 36, with a distal portion 34 of the secondary coil 30 disposed within the internal lumen 26 and a proximal portion 32 disposed proximal to the primary coil 20.

The retainer 50 engages the distal end 24 of the primary coil 20. The retainer 50, if present, is shaped such that there is minimized trauma to the vascular site upon delivery. In certain embodiments, the retainer 50 is ball-shaped. In some embodiments, the retainer 50 is rounded on the portion that is exterior to the lumen 26 and the diameter of the retainer 50 is equal to or slightly less that than the outer diameter of the primary coil 20. The stretch-resistant member 40 is disposed in the internal lumen 26. A distal end 44 of the stretch-resistant member engages the retainer 50. A proximal end 42 of the stretch-resistant member 40 engages the eyelet 64 of the rod 60. The distal portion of the rod 60 and the eyelet 64

6

are disposed in the internal lumen 26. A proximal portion of the rod 60 and the ball 62 extends proximally from the internal lumen 26 and is disposed proximal to the primary and secondary coils 20 and 30. The rod 60 and the proximal end 42 of the stretch-resistant member 40 are not connected to or attached to the primary or secondary coils 20 and 30 and are free to move within the internal lumen 26 in the direction of the longitudinal axis of the implant 10 and to move so that the rod 60 can assume an angle relative to the longitudinal axis of the implant 10.

The proximal end 42 of the stretch-resistant member 40 and the eyelet 64 form a coupling that can comprise any type of connection. The stretch-resistant member 40 is preferably a single line 46 that extends from the retainer 50 to the eyelet 64, passes through the eyelet 64, and extends from the eyelet **64** to the retainer **50**. The line **46** can also be a filament or a braid. When passing through the eyelet **64**, the line **46** is preferably wrapped through the eyelet 64 to form a knot 48, and is most preferably formed as a hitch knot as illustrated in FIG. 7. Alternatively, the line 46 can be one or more separate lines that terminate at the eyelet 64 to form a coupling with the eyelet **64**. In another alternative, the coupling can be formed in the stretch-resistant member 40 in a middle portion disposed between proximal and distal portions of the stretchresistant member 40, such as with a knot coupling the proximal and distal portions of the stretch-resistant member 40 together within the internal lumen 26. In yet another alternative, the coupling can be a combination of a knot and a wrapping, or a combination of multiple lines **46** employing different couplings. The coupling can also involve the modification of the stretch-resistant member 40 at the point of coupling, such as by deforming or melting of the stretchresistant member 40 to join the end of a line 46 back onto itself to form a closed loop. In still another alternative, an eyelet can be formed at the proximal end of the stretch-resistant member 40 that is coupled to the distal end of the rod 60, with the distal end of the rod 60 knotted to form the coupling, or with the distal end of the rod 60 deformed or melted back onto itself to form a closed loop.

The inner diameter of the secondary coil 30 is selected to engage the eyelet 64 and to engage the positioning device 70 (shown in FIG. 1A).

The rod 60 can have various cross-sectional shapes, such as a circular or triangular shape. The ball 62 can be replaced with another structure such as a disc, hook, or ring structure that preferably provides an external diameter or equivalent dimension comparable to the ball 62.

#### Fibers

The primary coil **20**, secondary coil **30**, and the stretch-resistant member **40** can also comprise at least one fiber **85**. The fiber(s) **85** can be a plurality of fibers, at least one bundle of fibers, or a plurality of fiber bundles. The fiber(s) **85** can be enlaced, tied, or knotted to a number of places on the implant **10**. The fibers or fiber bundles **85** can be disposed so that they are not tied or knotted to the implant **10**, thereby avoiding potentially obstructive bundles that might hinder deployment of the implant **10** or might mechanically damage the implant **10**. The use of fibers with coils is disclosed in U.S. Publ. No. 2006/0036281, which is incorporated by reference in its entirety.

In one embodiment illustrated in FIGS. 8A and 8B, the fiber 85 is wrapped at least one or two times around the stretch-resistant member 40. In one embodiment, the fiber(s) 85 include a plurality of fibers, at least one bundle of fibers, or

a plurality of fiber bundles wrapped at least one or two times round the stretch-resistant member 40.

In another embodiment, the fiber(s) **85** are enlaced through a single loop around the primary coil **20** and optionally the secondary coil **30**. In another embodiment, the fiber(s) **85** are enlaced through a pair of loops of the primary coil **20** and optionally the secondary coil **30**. In yet another embodiment, the fiber(s) **85** are enlaced in a "S" pattern through a plurality of loops in the primary coil **20** and optionally the secondary coil **30**. In still yet another embodiment, the fiber(s) **85** are enlaced adjacent to each other in a "S" pattern on the primary coil **20** and optionally the secondary coil **30**.

#### Materials

The primary and secondary coils 20 and 30 and rod 60 are preferably made of a biocompatible metal or metal alloy wire that does not react adversely with tissues and fluids when used in the body. The wire may be round, square, oval, triangular, or another shape. In certain embodiments the wire commonly 20 has a diameter of from about 0.025 to about 0.09 mm, from about 0.03 to about 0.08 mm from about 0.04 to about 0.06 mm. In certain specific embodiments the wire has a diameter of about 0.05 mm. In some embodiments the wire may be comprised only of a primary shape e.g., a simple single helix. 25 In some embodiments the wire component may comprise a primary shape e.g., helical coil and a secondary shape which the coil is biased to form upon release from the catheter or guidewire. The secondary shape may comprise a complicated three dimensional shape. These shapes include spherical, 30 cubic and other space-filling shapes, such as those created by winding the wire in a series of mobius loops. This embodiment is described in can be found in U.S. Ser. No. 12/038,737, filed on even date herewith as attorney docket number 355492-7601 and titled "An implant, a mandrel, and a method 35 of forming an implant." This application is incorporated by reference in its entirety.

In other embodiments the wire can comprise a coil of coils or double helix. When it is a coil of coils, the outer or secondary diameter of the outer helix may be from about 1 to 40 about 25 mm in some embodiments and from about 2 to 20 mm in certain other embodiments. The primary (inner) helix may typically have an outside diameter of from about 0.1 to about 0.8 mm in some embodiments, and from about 0.15 to about 0.6 mm in other embodiments and from about 0.2 to 45 about 0.4 mm in yet other embodiments. Certain specific embodiments provide for coils having a primary diameter of about 0.28 mm sized to pass through a correspondingly dimensioned catheter. Yet other embodiments provide for coils having a primary diameter of about 0.24 mm sized to 50 pass through a correspondingly dimensioned catheter.

In one embodiment, the material of the primary and secondary coils 20 and 30 and rod 60 are made of a material that may be heat set at a temperature of approximately 650° C. The metal or metal alloy can be radiopaque so that the position and location of the implant in the body can be monitored with radiological techniques. Suitable metals include, but are not limited to the noble metals such as the platinum group metals which include platinum, palladium, rhodium and rhenium as well as iridium, gold, silver, tungsten, and tantalum and alloys of these metals with one another. Additional metals include the super elastic metals such as "Nitinol" and the like. In one embodiment, the primary and secondary coils 20 and 30 are made of a platinum alloy, and the rod 60 is made of stainless steel.

The overall axial length of the implant 10 of this invention ranges from about 5 to about 400 mm in some embodiments

8

and from about 10 to about 300 mm in other embodiments. This length may be selected depending upon the particular application of use and may be longer than about 400 mm in some embodiments.

The stretch-resistant member 40 and the retainer 50 are preferably made from a wide variety of materials. These materials can include any of the metals suitable for making the primary and secondary coils 20 and 30. The stretch-resistant member 40 and the retainer 50 can also be made of a radiopaque material, or of a polymer.

The stretch-resistant member 40, retainer 50, and fibers/ fiber bundles 85 are preferably made of polymeric materials, and most preferably made of polypropylene. The retainer **50** is also preferably formed from a melt of the stretch-resistant 15 member 40. The polymeric materials can include materials approved for use as implants in the body or which could be so approved. They can be nonbiodegradable polymers such as polyethylene, polyacrylics, polypropylene, polyvinylchloride, polyamides such as nylon, e.g., Nylon 6.6, polyurethanes, polyvinylpyrrolidone, polyvinyl alcohols, polyvinycellulose lacetate, polystyrene, acetate, polytetrafluoroethylene, polyesters such as polyethylene terephthalate (Dacron), silk, cotton, and the like. The nonbiodegradable materials for the polymer component can comprise polyesters, polyethers, polyamides and polyfluorocarbons.

The polymeric materials can be biodegradable as well. Representative biodegradable polymers include: polyglycolic acid/polylactic acid (PGLA), polycaprolactone (PCL), polyhydroxybutyrate valerate (PHBV), polyorthoester (POE), polyethyleneoxide/polybutylene terephthalate (PEO/ PBTP), polylactic acid (PLA), polyglycolic acid (PGA), poly (p-dioxanone), poly(valerolactone), poly(tartronic acid), poly(β-malonic acid), poly(propylene fumarate), poly(anhydrides), and tyrosine-based polycarbonates. Other equivalent materials, including but not limited to stereoisomers of any of the aforementioned, may be used as well. The biodegradable polymer can be comprised of copolymers of lactic acid and glycolic acid. The copolymer can be comprised of glycolic/ lactic acid in the ratio of 90:10. The ratio of glycolic to lactic acid can be chosen from 99:1; 90:10; 95:5; 50:50; 10:90; 5:95; and 1:99. The fibers can also be comprised of Nylon 6.6.

The stretch resistant member 40 and the fiber(s) 85 may also comprise a bioactive coating. The bioactive coating may be selected from growth factor, a gene, an oligonucleotide, a peptide, a marine biopolymer, a monosaccharide, a disaccharide, a polysaccharide, collagen and combinations thereof.

The illustrated stretch-resistant member 40 preferably has a tensile strength of 0.2 and 1.2 Newton. In some embodiments, the tensile strength is 0.6 Newton.

#### Positioning Device

The implant described herein may be delivered by a variety of suitable microcatheters and positioning devices. In one embodiment, the invention is directed to a kit having one or more implants of the invention and a positioning device. In another embodiment, the kit includes a microcatheter. Suitable microcatheters positioning devices are described in WO 2007/121405 entitled "System and Method For Mechanically Positioning Intravascular Implants" which is hereby incorporated by reference in its entirety.

In one embodiment, as illustrated in FIG. 3, the implant 10 can engage a positioning device 70 such that the ball 62 and the proximal portion of the rod 60 engage the distal end 74 of the positioning device 70. The illustrated positioning device 70 can include a positioner 75 with a positioner tube 76

having an actuator interface 77 and an implant interface 78 that terminates at an end cap 79. The end cap 79 can have a port 80 through which the rod 60 communicates with the positioner lumen 81. The positioner 75 can also include a cord 82 that occludes a portion of the port 80 to prevent the disengagement of the implant 10 from the implant interface 78.

It is believed that, because the stretch-resistant member 40 resists stretching, rod 60 is prevented from moving in the proximal direction out of the secondary coil 30. However, as can be seen in FIG. 6A, the stretch-resistant member 40, 10 shown as line 46, remains sufficiently flexible to allow the rod 60 and the ball 62 to assume an angled position relative to the axis of the implant 10.

As can be seen in FIG. 6B, implant 10 can be mechanically released from positioning device 70 by retracting cord 82 so 15 that the aperture of implant interface 78 is now sufficiently wide to permit ball 62 to traverse therethrough whereupon implant 10 is released into the vascular site. In this embodiment, ball 62 and rod 60 move in a distal direction relative to the primary coil as described below or the primary coil 20 and 20 secondary coil 30 move proximally relative to the ball 62 and rod 60. Such movement places the ball 62 and rod 60 further into the internal lumen 26 within the primary coil 20, and in some embodiments fully enter the internal lumen 26 of the primary coil 20. In this case, ball 62 and rod 60 are fully 25 engulfed within lumen 26 so as to form a stemless implant.

This flexibleness of the implant 10 of the invention reduces the amount of catheter kick-out. Catheter kick out refers to the movement of the catheter from its preformed shape after deployment of the implant and is typically measured by the angle of deflection, shown in FIG. 4B as 92. Implants of this invention typically have a catheter deflection of 40°, 30°, 20°, 19°, 15°, 10° or less. This reduction of catheter kick out is at least a 20%, 30%, 40%, 50%, and even 60% improvement over implants of the art.

It is also believed that, when the implant 10 is a neurological coil, the coil assumes two orientations, a microcatheter orientation when disposed in a microcatheter and a deployed orientation when external to the microcatheter. The transition of the coil from the microcatheter orientation to the deployed 40 orientation is believed to cause the primary coil 20 to curve or bend and to extend slightly in length on at least one side of the primary coil 20, while the stretch-resistant member 40 does not so extend, thereby causing the proximal end of the implant 10 move relative to rod 60 and ball 62 and surround 45 the rod and ball. This movement of the primary and secondary coils 20 and 30 relative to the rod 60 and ball 62, to enclose the rod and ball within the lumens of the coils 20 and 30, is believed to advantageously provide a structurally stable proximal implant end because any additional movement of 50 the rod 60 and ball 62 is contained within the coils 20 and 30. It is further contemplated that the implant 10 is better able to conform to the desired vascular site.

### Alternative Detachment Means

The implant may be deployed into the body by a number of means, including, but not limited to electrolytic detachment, chemical detachment, hydraulic detachment, thermal detachment, as well as other types of mechanical detachments. It is contemplated that the implant remains stemless after deployment into the body because after deployment, the rod **60** and ball **62** will be displaced in the inner lumen of the secondary coil **30**. In other words, the ball **62** is drawn into the inner lumen of at least the secondary coil **30**.

Electrolytic detachment may be performed by providing a weakened section at a junction between the implant 10 and

**10** 

the positioner **75**. Regardless of the junction, due to the stretch-resistant member, the rod **60** and ball **62** will still be displaced in the inner lumen of the secondary coil **30** and possibly the primary coil **20**. This weakened section may be easily vaporized by application an electric current. For example, the rod **60** and/or ball **62** may be replaced by a wire that may be detached by an electrical force, such as a 9V electric power source that can apply a current of about 0.3 milliamps for detachment. One example of an electrical detachment mechanism is described in U.S. Pat. No. 5,928, 226, which is incorporated herein by reference.

With a chemical detachment mechanism, a dissolvable detachment section is included between the positioning device 70 and the implant 10 or at the distal end of the positioner 75. The dissolvable detachment section is dissolved, softened, swollen, degraded, or otherwise changed by the injection of a biocompatible chemical through the catheter. After the section is eroded, the rod 60 and ball 62 move distally into the lumen of the secondary coil 30 or the primary coil 20 and secondary coil 30. Some examples of chemical detachment systems include dissolvable detachment sections, such as a polymer section which is dissolved by dimethylsulfoxide, a nylon section which is dissolved by a fluorinated hydrocarbon, or sections which are dissolved by an aqueous saline solution or any of the other biocompatible solvents discussed above.

A hydraulic detachment mechanism may also be used with the implant of the invention. Hydraulic detachment means are within the scope of the art. In one embodiment, the implant interface 78 is formed of a material having a durometer such that when an appropriate fluid pressure is applied to the interior of the positioning device 70, the implant interface 78 expands thereby releasing the ball 62 and allowing the ball 62 to move distally into the lumen of the secondary coil and optionally the primary coil.

The implant of the invention may also be configured to be thermally detached from the positioner. This embodiment is similar to the electrolytic detachment described above; however, instead of applying an electric current, heat is applied thereby allowing the engagement portion to detach from the position 70 and move distally into the lumen of the catheter.

While the present invention has been disclosed with reference to certain embodiments, numerous modifications, alterations, and changes to the described embodiments are possible without departing from the sphere and scope of the present invention, as defined in the appended claims. Accordingly, it is intended that the present invention not be limited to the described embodiments, but that it has the full scope defined by the language of the following claims, and equivalents thereof.

We claim:

55

- 1. An implant, comprising:
- a primary coil defining a lumen disposed along an axis, the primary coil having a proximal end defining a proximal aperture and a distal end defining a distal aperture;
- a secondary coil further defining the proximal aperture which secondary coil is coaxial with the primary coil and having an outer diameter, an inner diameter, a distal end and a proximal end;
- a stretch-resistant member disposed within the lumen;
- a member comprising a proximal member section, a distal member section and a central axis that intersects the proximal aperture, the distal member section being coupled to the stretch-resistant member within the lumen, the proximal member section having an engagement portion exterior to the lumen wherein said engagement portion and said member are capable of moving

- distally into the lumen, the distal member section configured to engage the inner diameter of the secondary coil to prevent proximal extraction of the member from the secondary coil, the member being freely distally movable with respect to said secondary coil; and
- a retainer engaging the distal aperture and coupled to the stretch-resistant member within the lumen.
- 2. The implant of claim 1, wherein the engagement portion and member are capable of moving distally completely into the lumen.
- 3. The implant of claim 1, wherein the member freely is movable with respect to said primary coil.
- 4. The implant of claim 1, wherein the primary coil has an outer and an inner diameter and the secondary coil has an outer diameter which is smaller than or equal to the inner 15 diameter of the primary coil.
- 5. The implant of claim 1, wherein the proximal end of the primary coil is adjacent to or partially envelopes the distal end of the secondary coil.
- 6. The implant of claim 1, wherein the primary coil and the secondary coil are independently comprised of a metal wire.
- 7. The implant of claim 6, wherein the primary coil wire is comprised of a metal selected from the group consisting of platinum, palladium, rhodium, rhenium, iridium, gold, silver, tungsten, tantalum, an alloy of two or more of these metals, or a super elastic metal.

  32. The implant of member is coupled to member is coupled to the selected from the group consisting of member is coupled to the selected from the group consisting of member is coupled to the selected from the group consisting of member is coupled to the selected from the group consisting of member is coupled to the selected from the group consisting of member is coupled to the selected from the group consisting of member is coupled to the selected from the group consisting of member is coupled to the selected from the group consisting of member is coupled to the selected from the group consisting of member is coupled to the selected from the group consisting of member is coupled to the selected from the group consisting of member is coupled to the selected from the group consisting of the selected from the group consisting of the selected from the group consisting of member is coupled to the selected from the group consisting of the group consisting of the group co
- 8. The implant of claim 7, wherein the primary coil wire is a platinum alloy.
- 9. The implant of claim 1, wherein the primary coil and the secondary coil are comprised of a primary helix which is itself 30 wound and set into a secondary shape.
- 10. The implant of claim 9, wherein the secondary shape is selected from helical, spheroidal, cubic, and tertiary space-filling shapes.
- 11. The implant of claim 1, wherein the stretch-resistant 35 member is comprised of a polymer.
- 12. The implant of claim 11, wherein the polymer is biodegradable or non-biodegradable.
- 13. The implant of claim 12, wherein the polymer is polypropylene.
- 14. The implant of claim 11, wherein the stretch-resistant member is further comprised of a bioactive coating.
- 15. The implant of claim 14, wherein the bioactive coating is selected from the group consisting of a growth factor, a gene, an oligonucleotide, a peptide, a marine biopolymer, a 45 monosaccharide, a disaccharide, a polysaccharide, collagen and combinations thereof.
- 16. The implant of claim 1, further comprising a plurality of fibers.
- 17. The implant of claim 16, wherein the fibers are wrapped 50 around the primary and/or secondary coil at least one time.
- 18. The implant of claim 16, wherein each fiber is wrapped around the stretch resistant member at least one time.
- 19. The implant of claim 17 or claim 18, wherein each fiber is wrapped around at least two times.
- 20. The implant of claim 16, wherein the fibers are comprised of a copolymer of glycolic acid and lactic acid.
- 21. The implant of claim 20, wherein the fibers further comprise a bioactive coating.
- 22. The implant of claim 21, wherein the coating is either a 60 lubricious hydrophilic coating or a hydrophobic coating.
- 23. The implant of claim 21, wherein the coating comprises a copolymer of lactic acid and glycolic acid.
- 24. The implant of claim 16, wherein the fibers are comprised of a biodegradable polymer.
- 25. The implant of claim 24, wherein the biodegradable polymer is selected from the group consisting of polyglycolic

12

- acid, polycaprolactone, polyhydroxybutyrate valearte, polyorthoester, polylactic acid, poly(p-dioxanone), poly(valerolactone), poly(tartronic acid), poly( $\beta$ -malonic acid), poly (propylene fumarate), poly(anhydrides), and tyrosine-based polycarbonates.
- 26. The implant of claim 25, wherein the polymer is polyglycolic acid and polylactic acid and is present in a ratio of polyglycolic acid to polylactic acid selected from 99:1; 95:5, 90:10, 50:50, 10:90, 5:95, or 1:99.
- 27. The implant of claim 1, wherein the retainer has a portion that is exterior to the lumen of the primary coil.
- 28. The implant of claim 27, wherein the portion that is exterior has a shape that is rounded.
- 29. The implant of claim 1, wherein the retainer is comprised of a polymer.
- 30. The implant of claim 29, wherein the polymer is polypropylene.
- 31. The implant of claim 1, wherein the distal portion of the member having a central axis that intersects the proximal aperture comprises an eyelet.
- 32. The implant of claim 31, wherein the stretch resistant member is coupled to the eyelet with a knot.
- 33. The implant of claim 32, where in the knot is a half-hitch or a hitch knot.
- 34. The implant of claim 1, wherein the engagement portion is disengageable from a positioner by chemical detachment, electrolytic detachment, mechanical detachment, hydraulic detachment, or thermal detachment.
- 35. A method of embolizing a vascular site in a patient, comprising:
  - introducing to said site via a positioner an implant, the implant comprising
    - a primary coil defining a lumen disposed along an axis, the primary coil having a proximal end defining a proximal aperture and a distal end defining a distal aperture;
    - a secondary coil further defining the proximal aperture which secondary coil is coaxial with the primary coil and having an outer diameter, an inner diameter, a distal end and a proximal end;
    - a stretch-resistant member disposed in the lumen;
    - a retainer engaging the distal aperture and coupled to the stretch-resistant member within the lumen; and
    - a member comprising a proximal member section, a distal member section and a central axis that intersects the proximal aperture, the distal member section being coupled to the stretch-resistant member within the lumen, the proximal member section having an engagement portion exterior to the lumen, wherein said member is capable of moving distally into the lumen, the distal member section configured to engage the inner diameter of the secondary coil to prevent proximal extraction of the member from the secondary coil, the member being freely distally movable with respect to said secondary coil;
  - detaching said implant from the positioner by disengaging the positioner from the engagement portion of said member, wherein said detaching step comprises moving the member distally into the lumen; and
  - embolizing the vascular site.

55

- 36. The method of claim 35, wherein the implant substantially conforms to the vascular site.
- 37. The method of claim 35, wherein the positioner is a microcatheter.
  - 38. The method of claim 35, wherein said detaching said implant from the positioner comprises chemical detachment,

electrolytic detachment, mechanical detachment, hydraulic detachment, or thermal detachment.

- 39. The method of claim 38, wherein said detaching the implant comprises mechanical detachment, the mechanical detachment comprising moving a cord to disengage the 5 implant.
- 40. The method of claim 38, wherein after detachment, the member and engagement portion are free to move within the lumen.
- 41. The method of claim 40, wherein after detachment the engagement portion and member are contained in the lumen.

**14** 

- 42. The method of claim 41 wherein the engagement portion is completely contained in the lumen.
- 43. The method of claim 38, wherein the implant is stretch-resistant prior to detachment from the positioner.
- 44. The method of claim 43, wherein the implant is no longer stretch-resistant after detachment from the positioner.
- 45. The method of claim 38, further comprising delivering additional implants.
