

US008490792B2

(12) United States Patent D'Amato

(10) Patent No.:

US 8,490,792 B2

(45) **Date of Patent:**

*Jul. 23, 2013

(54) PACKAGE

(75) Inventor: Gianfranco D'Amato, Arzano Napoli

(IT)

(73) Assignee: Seda S.p.A., Arzano Napoli (IT)

(*) Notice: Subject to any disclaimer, the term of this

patent is extended or adjusted under 35

U.S.C. 154(b) by 26 days.

This patent is subject to a terminal dis-

claimer.

(21) Appl. No.: 11/998,619

(22) Filed: Nov. 30, 2007

(65) Prior Publication Data

US 2008/0164268 A1 Jul. 10, 2008

(30) Foreign Application Priority Data

(51) Int. Cl.

(57) ABSTRACT

A package includes a container having an opening, a bottom and at least one inner wall. The package further includes at least one outer wall formed from a two-dimensional pre-cut part having a removable wall section that is a removable card which discloses an information. The pre-cut part includes an access section that is formed at a peripheral edge of the pre-cut part so as to provide an open space adjacent to the removable wall section when the pre-cut part is connected to itself to form the outer wall of the package.

PACKAGE

RELATED APPLICATIONS

Applicant claims, under 35 U.S.C. §119, the benefit of priority of the filing date of Dec. 5, 2006, of German patent application, Serial No. 20 2006 018 406.6, a copy of which is enclosed. The entire contents of the priority application are incorporated herein by reference.

The present invention refers to a multi-layered package and particularly to a container comprising a container opening and a container bottom, wherein preferably at least one outer wall comprises a predetermined removable wall section revealing an information.

The state of the art discloses packages, which are provided with a label designated to reveal at first hidden information to the public. For this purpose, the user grasps the label or at least part of same and peels it off. Due to the peeling off, the information became public hidden and it may be located on 20 the inner side of the label or on the outer side of a layer that was originally located underneath same. The information may also be a piece hidden behind the label, e.g. a sticker.

Different types of packages are known from DE 697 12 370T2 and DE 698 07 259T2.

In a package according to DE 697 12 370 T2 a multilayered label is arranged on the surface of the package, wherein one label or a plurality of labels are arranged in parallel on the surface, which are affixed or may be peeled off from the label.

Further, a different type of multi-layered package is known from practice, wherein a drinking container, namely a cup, is combined with an insulating casing. Both predominantly consist of cardboard and are manufactured separately. The insulating casing has a corrugated surface for the purpose of 35 insulation and is loosely slid over the cup from the bottom before filling the cup. The casing may serve as a carrier of an information, e.g. advertisement. Since it is not durably connected to the cup, it can be removed therefrom.

This package is a simple solution, however, it has the 40 disadvantage that the casing is separated from the drinking container and must be assembled by the sales personnel of a sales stand before handing it out to the customer so that both a separate storage as well as assembly work is required to bring the package to the final form.

The invention is based on the object to provide a costeffective and simpler package of the above-mentioned type at the same time. This object is solved by the characterizing features of the main claim.

The removable wall section is formed as a card and is firstly an integrated component of at least the outer wall. Due to appropriate measures it is prepared to unhinge from the package particularly easy and without interference of the other components when grasped by the user. When the wall section itself serves as a carrier of information, and if maybe furthermore it is desired to obtain it in a predetermined shape during a certain using period, it may be built from a relatively resistant material. Advantageously, the outer wall of the package is made of the same material.

In this regard, paper, cardboard, plastic or the like are 60 known, wherein the material these materials may be coated if this is essential for the purpose of the package. This applies especially for food and their respective packages.

Thus, the wall section itself may serve as a carrier of information. Alternatively, after unhinging the same, it may 65 expose the information which it has originally covered. To facilitate the unhinging of the wall section for the user it is

2

possible to choose the material of the wall section and/or the outer wall so that the user may remove the wall section from the composite.

For the purpose of disclosing the information, the wall section may either be partially or completely removed. In the first case, it is still connected with the wall. In the other case, it is completely separated from the wall. While removing the wall section, in both cases a window is opened within the outer wall for the viewer.

The package may be used for serving people, especially in gastronomy (for example in snack bars), to contain food or beverages. Since in this application area the production costs are very important, the package may be formed of paper, cardboard, plastic or the like.

Minimally, the package exists of two walls, i.e. an inner and an outer wall, which are advantageously separated from each other for the purpose of insulation. Due to the space, an insulation space is formed between the walls, which may also be separated from the surrounding to hold the fluid contained therein, in particular air.

During use, the good insulation values that arise bring the advantage that freshly brewed coffee may be filled in such a double-wall package, especially a cup. The user is then able to grasp the package with the hand, even though the coffee still has a high temperature.

The wall section formed as a card may also be relatively stiff, like the outer wall of the package, to facilitate the unhinging of the outer wall and to provide it with a certain durability for the prospective use.

Furthermore, the package, and especially a package having a wall section provided on the outer wall, provides a further information carrier, which requires cooperation of the consumer in that the consumer identifies the wall section, understands its function and opens the wall section to reach the additional information.

Thus, this embodiment of the invention solves two reluctant objects, namely the optimization of the insulation and the provision of an initially covered and inaccessible additional information.

The removable wall section is formed as part of the package which still ensures a sufficient insulation of the product located within the package. Furthermore, the outer wall at the same time serves as a second wall of the double-walled cup and also ensures dimensional stability when the wall section is removed to reach the additional information. Caused by the spacing of the two walls, the wall section can furthermore especially simply be removed, since it is not connected to the inner wall. This facilitates handling of the wall section to the user.

Due to the fact that the wall sections is also formed as part of the package, rising costs in the production process can be avoided, since additional working steps to produce and attach the wall section do not accrue.

Advantageously, a predetermined braking line may determine the size, shape and position of the wall section. This enables a fast and clean separation of the wall section from the outer wall in the size, shape and position desired by the manufacturer.

The shape of the wall section may substantially be square, rectangular, round, oval or trapezoidal. These shapes have proven to be especially simple and cost-effective in manufacture and enable a simple removal from the cup wall. Of course, other shapes are also conceivable.

In an advantageous embodiment of the invention, the wall section is rectangular and has a length L and a width B. The length L extends in the peripheral direction and the width B extends in the direction of the envelope. With this arrange-

ment of the wall section in the direction of the alignment axes of the cup, the wall section may be removed or separated particularly easy and simple from the outer wall.

In a further embodiment of the invention, the predetermined breaking line may be supplemented by a bending line, 5 which connects both ends of the predetermined braking line with one another. Thereby it can be prevented that the wall section is completely separated from the cup wall. Thus, the wall section remains attached on the cup.

In an especially advantageous embodiment of the invention, the predetermined breaking line of the wall section may substantially be formed as a perforation. The perforation allows a quick separation of the wall section from the outer wall. If a part of the predetermined breaking line does not have a perforation, the separated surface of the wall section is 15 for the needs of the user. smooth in this area and does not have any perforation webs.

In an advantageous embodiment of the invention, the wall section may be provided with an imprint at an inner and/or outer side. Therefore, advertisement may be applied e.g. on one side of the wall section and on the other side of the wall 20 section, a collection card, or a valued customer bonus card may be imprinted.

In an advantageous embodiment of the invention, a substantially peripheral imprint may be arranged on the outer side of the inner wall. Thereby it can be ensured that the 25 imprint is visible in any arrangement of the cups with respect to each other through the open wall section. A precise placing of the outer cup with respect to the inner cup can therefore be dispensed with.

In an especially advantageous embodiment of the invention, at least the outer wall of the cup may be composed of a two-dimensional pre-cut part, which can be connected with itself. This structure represents a cost-effective and fast production of the cup with the removable wall section.

tion may extend at the outer wall around the circumferential direction of the cup. Since the cup is enclosed when being used by a hand of a user in the peripheral direction of the cup, and thus the cup bottom and the cup opening are aligned vertically, removal of the wall section from the outer wall is 40 facilitated to the user by the positioning in the circumferential direction.

In an advantageous embodiment of the invention, the wall section may adjoin an edge of the pre-cut part extending in the envelope direction of the cup. This facilitates removal of the 45 wall section if the pre-cut part is connected with itself, since the portion of the wall section adjoining the edge projects due to the material properties and can therefore easily be held by the user.

In a further embodiment of the invention, the wall section 50 may project over the edge of the pre-cut part in an overlapping manner and form a handle. If the wall section shall be removed, this flap can be gripped very easily and accelerate the removal process.

In an especially preferred embodiment of the invention, an 55 access section may adjoin the wall section at an overlapping portion of the pre-cut part. This access section may be formed such that a portion is cut out in the central portion of the end edge of the pre-cut part, said portion being formed by two edges extending substantially in parallel with respect to 60 another, standing vertically on the end edge, and by the adjoining wall section. If the pre-cut part is connected with itself, the material of the pre-cut part does not overlap in the area of the access section, and caused by the recess produced thereby with respect to the circumferential wall of the cup, the 65 wall sections can more easily be lifted by the fingers of the user and be separated.

In a further embodiment of the invention, the pre-cut part may have a holder adjacent to the wall section to open the wall section more easily. This holder may be a handle attached at the wall section, such as a flap. By such a device, the gripping and removal of the wall section is significantly facilitated for the user.

In an especially advantageous embodiment of the invention, the length L of the wall section may be larger than the width B, wherein the length L extends in the peripheral direction. The ratio of the two dimensions with respect to one another may have an influence on the tear-off behavior of the wall section. Since the length L is larger than the width B, and the length L extends in the circumferential direction, the advantage also results that the tear-off position is improved

In a further embodiment of the invention, the wall section may be arranged in a manner inclined at an angle α . Caused by the inclined arrangement of the wall section, the tear-off behavior of the wall section may on the one hand be improved and furthermore, any number of orientations of the imprint on the inner wall can be carried out, said imprint always being visible through the opening of the wall section.

On the other hand, the length L of the wall section may also be arranged in the direction towards the surface line of the cup so that the user is capable of removing the wall section also if the package has a position other than the above described position of use.

It is favorable if the axis of symmetry of the wall section in the peripheral direction of the package forms a point of intersection with an edge of the wall section, said edge adjoining the access section and being particularly rounded. The position of the wall section and of the point of intersection with respect to the axis of symmetry is variable depending on the angle α . Since the wall section is rounded in this area, the In a favorable embodiment of the invention, the wall sec- 35 unsymmetrical arrangement can optically not be recognized. Furthermore, an advantageous tear-off position of the wall section can be produced by this arrangement.

> An embodiment of the invention will now be described by means of the following drawings.

FIG. 1 shows a first embodiment of the package.

FIG. 2 shows a package according to FIG. 1 with a wall section being formed as part of the outer wall, said wall section being partially detached.

FIG. 3 shows a package according to FIGS. 1 and 2, wherein the wall section is detached and removed from the outer wall.

FIG. 4 shows a two-dimensional pre-cut part of an outer wall for a package according to FIG. 1 to 3, wherein the access section was cut out.

FIG. 5 shows a second embodiment of the package.

FIG. 6 shows a third embodiment of the package.

FIG. 7 shows a fourth embodiment of the package.

FIG. 8 shows a fifth embodiment of the package, and

FIG. 9 shows a sixth embodiment of the package.

FIG. 10 shows a seventh embodiment of the package.

FIG. 11 shows a eighth embodiment of the package.

FIG. 12 shows a ninth embodiment of the package.

FIG. 1 shows a front view of a package according to the invention in the form of a cup, having an inner wall 3 and an outer wall 2 and a wall section 4 formed as part of the outer wall 2. The inner wall 3 is composed of a two-dimensional pre-cut part, which is connected with itself. The outer wall 2 is composed of a two-dimensional pre-cut part 6, which is connected in an overlapping portion 9 with itself during manufacture of the cup. The inner wall 3 is arranged with its lower end at a spacing to the lower end of the outer wall 2, wherein this lower end is formed as container bottom 11

5

through a bottom portion. The outer dimensions of the inner wall 3 are smaller than the outer dimensions of the outer wall 2 so that the inner wall 3 is arranged in the outer wall 2 and the insulation space 20 between the inner wall 3 and the outer wall 2 serves for the thermal insulation of the double-walled 5 cup 1 and is filled by a fluid and particularly by gas. The cup 1 has a container opening 10 opposite to the container bottom 11. At this container opening 10 an outwardly crimped mouth roll is arranged, which is formed as part of the inner wall 3 and which encircles the outer wall 2. The inner wall 3 and the outer wall 2 are connected to one another in the area of the container opening and taper at a predetermined angle in the direction of the container bottom 11 so that the shape of a truncated cone is produced in whose bottom portion the inner wall 3 and the outer wall 2 are also connected. Caused by this 15 structure, the double-walled cup obtains a dimensionally stable shape.

The outer wall 2 has a wall section 4 in form of a card, which in a preferred embodiment has a perforated predetermined breaking line 5. This predetermined breaking line 5 is 20 attached during the manufacture of the two-dimensional precut part 6. The size, shape and position of the wall section 4 at the outer wall 2 is optionally variable. The predetermined breaking line 5 may also be a predetermined breaking line 5 whose weakening portion separates the wall section 4 from 25 the outer wall 2. An access section 8 may be arranged at an edge 7 of the pre-cut part 6 in the overlapping portion of the pre-cut part 6. As may be seen in FIG. 5, the pre-cut part 6 is cut out in the area of the access section 8.

If during manufacture of the cup 1, the pre-cut part 6 is 30 connected with itself, so that the edges 7 form an overlapping portion 9, the wall section 4 provided in the outer wall 2 in form of a card, projects in the area of the access section 8. This projecting portion serves for opening the wall section 4 with the fingers of the user more easily. By slightly lifting this 35 portion, the perforation of the predetermined breaking line 5 is damaged and an aimed separation of the wall section 4 along the predetermined breaking line 5 is carried out in the case of a further effect of power.

The portion which serves for lifting the wall section 4 does 40 not have a perforation in the area of the access section 8.

The wall section 4 in form of a card is imprinted on one side and/or on both sides. FIG. 1 shows the imprinted outer wall 2 of the cup with an imprinted wall section 4.

FIG. 2 shows the partially separated wall section 4 at the 45 outer wall 2 of the cup 1. The wall section 4 has a perforated predetermined breaking line. The separation of the wall section 4 formed as a card, from the outer wall 2 does not damage the inner wall 3 of the cup 1. The side of the wall section 4 located in the interior of the cup 1 is also imprinted. For a user 50 the imprint only becomes visible if the wall section 4 is removed from the outer wall 2 of the cup 1.

If the predetermined breaking line 5 of the wall section 4 is not formed along the entire periphery, a separation process does not completely remove the wall section 4 from the outer 55 wall 2 of the cup 1. The wall section 4 remains connected to the outer wall 2 at least in parts.

In the following FIGS. 3 to 9 different embodiments of the wall section 4 according to FIG. 1 are shown. In these Figures, as well as in all other Figures, identical parts are characterized 60 by identical reference numerals and they are only mentioned partially in connection with a Figure.

FIG. 3 shows a preferred embodiment of the wall section 4 formed as a card in the outer wall 2 of the cup 1. The wall section 4 has the dimension length L and width B, wherein the 65 length L is larger than the width B. The length L extends in the peripheral direction U of the cup 1. The two shorter edges

6

have a rounded shape, whereby on the one hand the outer appearance of the wall section 4 is influenced and on the other hand gripping the wall section 4 by the user is facilitated. The wall section 4 is arranged such that the long edges extend in parallel to the container opening 1. The wall section 4 may, however, also be arranged at any angle with respect to the container opening 10.

FIG. 4 shows a two-dimensional pre-cut part 6 of the outer wall 2, which is connected with itself and which together with an inner wall 3 forms a double-walled cup 1. The wall section 4 in the form of a card is formed by means of a predetermined breaking line 5 in the pre-cut part 6. An access section 8 is cut out at the edge 7 of the pre-cut part so that the access section 8 forms two edges extending perpendicular with respect to the edge 7 and adjoining the wall section 4. The material of the access section 8 is removed from the pre-cut part 6. The axis of symmetry of the wall section 4 in the peripheral direction U of the package 1 forms a point of intersection 13 with an edge of the wall section 4 that adjoins with the access section 8. The wall section 4 projects over the edge 7 of the pre-cut part 6 in an overlapping manner and forms a flap serving as a holder 22.

FIG. 5 shows a wall section 4 as in FIG. 4 whose long edges extend in the direction of the envelope direction M of a cup 1. This embodiment does not have an access section 8 in the overlapping portion 9.

In FIG. 6 the wall section is arranged peripherally in the peripheral direction U of the cup 1. The distance of the wall section 4 to the container opening 10 and to the container bottom 11 is optional.

In a further embodiment the wall section 4, as shown in FIG. 7, has an oval shape. The size and position of the oval contour are optionally arranged at the outer wall 2 of the cup

FIG. 8 shows a further embodiment of the wall section 4 with a dimension length L and width B. The length L in this embodiment is larger than the width B so that a rectangular wall section 4 is produced. The length L may also be equally large as the width B so that a square wall section 4 is produced. The corners of the wall section 4 are rounded.

FIG. 9 shows a further embodiment of the wall section 4 according to FIG. 8, wherein the length L extends in the peripheral direction U and the width B extends in the envelope direction M. The edges of the wall section 4 are rounded.

The inner wall 3 and the outer wall 2 are arranged in any orientation with respect to one another and are connected to one another through the mouth roll 12 at the container opening 10 as well as at the container bottom 11. The inner wall 3 has a peripheral imprint so that this imprint can always be seen as soon as the wall section 4 is removed from the outer wall 2.

In a preferred embodiment, the wall section 4 formed as a card is imprinted on both sides. On the outer wall 2 of the cup 1, which is gripped by user, advertisement or the reference to a certain action is imprinted. After the wall section 4 is separated from the outer wall 2, the user can also look at the side of the wall section 4 which was up to then located in the cup. On the rear side of the wall section 4, advertisement or a collector card for bonus points may for instance be imprinted. The wall section 4 separated from the cup 1 then serves as a collector card for bonus points, which are for instance arranged on the outer wall 2 of the cup 1 in the form of stickers.

It must also be noted that further options for the shape and the imprint of the wall section 4 are possible. One option is for instance that the shape corresponds to a company logo or has any other geometric shape. 7

The outer wall 2 is substantially made of paper, cardboard or the like and can therefore be imprinted more easily, wherein this imprintability can even be improved by a plastic foil e.g. of polyethylene attached on the outer side. The inner wall 3 is substantially formed of paper, cardboard or the like 5 and additionally has a plastic layer for sealing the package.

Starting from the explained embodiment, the package may be modified in several ways. For example, the form of the package, and especially of a container, may vary so that an oval, rectangular or cylindrical container is formed (FIGS. 10, 10 11 and 12).

Furthermore, the inner and/or the outer wall may be formed of a fluid tight material, as for example plastic.

The wall section may be located in a corner area of a rectangular container so that an edge of the wall section 15 protrudes beyond and forms an overlap, which facilitates the separating of the wall section.

In a rectangular container according to FIG. 11, an overlap of the two-dimensional blank may be located on a lateral surface of the prism as well as in the corner areas, which may 20 also comprise a radius.

The invention claimed is:

1. A multi-layered container comprising one inner wall, one outer wall, an opening and a bottom, the outer wall comprises a predetermined removable wall section which 25 discloses an information, the removable wall section comprising a rounded short edge having a corner at each end, the short edge being connected to a longer edge at each of the corners, the inner wall and the outer wall being spaced apart from each other to form an annular insulation space comprising a continuous gas-filled gap between the inner wall and the outer wall, said inner and outer walls are connected to each other only in an area of the container opening and the container bottom, and the removable wall section is a one-piece removable card that is not in contact with the inner wall, 35 extends at the outer wall in a peripheral direction of the container and can be adjoined at an edge of a pre-cut part, said

8

edge extending in a direction from the bottom of the container toward the opening in the container and the removable wall section projects over the edge of the pre-cut part in an overlapping manner and forms a flap serving as a holder.

- 2. The multi-layered container as claimed in claim 1, wherein an access section is adjacent to the removable wall section at an overlapping portion of the pre-cut part.
- 3. The multi-layered container as claimed in claim 2, wherein the length (L) of the removable wall section is larger than the width (B), and wherein the length (L) extends in the peripheral direction of the container.
- 4. The multi-layered container as claimed in claim 2, wherein the removable wall section is arranged inclined with respect to the peripheral direction (U) at an angle α .
- 5. The multi-layered container as claimed in claim 2, wherein the length (L) of the removable wall section is arranged in a direction of an envelope line (M).
- 6. The multi-layered container as claimed in claim 2, wherein an axis of symmetry of the removable wall section in the peripheral direction (U) of the container forms a point of intersection with the edge of the wall section, said edge adjoining the access section, wherein the point of intersection with respect to the axis of symmetry of the access section is variable depending on the angle α .
- 7. The multi-layered container of claim 1 wherein the removable wall section is rigid.
- 8. The multi-layered container of claim 1 wherein at least the outer wall is formed of paper, cardboard or plastic.
- 9. The multi-layered container of claim 1 wherein a size, shape and position of the removable wall section is determined by a predetermined breaking line.
- 10. The multi-layered container of claim 1 wherein the information comprises an imprint.
- 11. The multi-layered container of claim 1 wherein the container is a beverage container.
