FIELD

The present invention relates to cycloalkylmethylamine derivatives, synthesis of cycloalkylmethylamine derivatives and methods of using cycloalkylmethylamine derivatives for the pharmacological treatment of obesity and obesity related co-morbid indications.

BACKGROUND

Obesity is a chronic disease that affects millions of people across the world especially in the developed countries. It is defined by excess body fat and is generally measured by calculating a person's BMI (body mass index). If a person's BMI is 30 or above, he or she considered to be obese. Obesity can cause a number of health problems either directly or indirectly, such as, for example, type 2 diabetes, coronary heart disease, high blood triglycerides, high blood pressure and stroke. Obesity also raises risk of certain types of cancer. Obese men are more likely than normal-weight peers to die from cancer of the colon, rectum, and prostate. Obese women are more likely than non-obese women to die from cancer of the gallbladder, breast, uterus, cervix and ovaries. Death from some cancers may be more likely because obesity makes the cancers harder to detect in the early stages (for example, the initial small lump of breast cancer may not be felt in an obese woman). Recent studies show obesity increases the risk of Alzheimer's-type dementia. Other disease and health problems linked to obesity include: gallbladder disease, gallstones, osteoarthritis, gout or joint pain, sleep apnea, psychological and social problems.

Obesity is caused by multiple factors, the primary factor being genetics which is the one factor relating to obesity over which individuals have no control. Other important factors involved in obesity are: the mechanisms of fat storage; the balance between energy intake and energy expenditure; an individual's life style: eating habits and exercise; and psychological, cultural and socioeconomic influences. Despite the seeming inexorable progression of this disease, there have been limited advances in the pharmacotherapy of this condition. Drugs to treat obesity can be divided into three groups: those that reduce food intake or appetite suppressants; those that alter metabolism or block the absorption of fat; and those that increase thermogenesis. Currently, there are only two drugs approved by the FDA for the long-term treatment of obesity and they are fat absorption blocker orlistat (XENICAL®) and the appetite suppressant sibutramine (MERIDIA®). The only thermogenic drug combination that has been tested is ephedrine and caffeine, but this treatment has not been approved by regulatory agencies.

The fat absorption blocker, orlistat works in the gastrointestinal tract by blocking an enzyme that is needed to digest fat. Instead of being absorbed from the intestine, up to one-third of the fat that a person consumes is excreted in the stool. In addition, orlistat blocks the absorption of needed fat-soluble vitamins A, D, E, and K, as well as beta-carotene. This is one of the major limitations of this drug for the long term use in the treatment of obesity. Most commonly reported other side effects of orlistat are bloating, diarrhea and oily stools.

In the appetite suppressant category, a few noradrenergic and serotonergic drugs belong to a family of 2-arylethy-

2

lamines are currently available in the market for the treatment of obesity. The noradrenergic agents such as phenylpropanolamine, (ACUTRIM®, DEXATRIM®), diethylpropion (TENUATE®), and phentermine (FASTIN®, IONAMIN®) are approved for the short-term treatment of obesity. Whereas, noradrenergic and serotonergic agent sibutramine (MERIDIA®) is the only drug currently approved for the long-term treatment of obesity in the appetite suppressant category. Sibutramine has cyclobutanemethylamine backbone and it is this backbone mainly responsible for its unique pharmacological properties.

In the last 10 years, a number of reports have been published on the possible use of sibutramine, either alone or in combination with other therapeutic agents, for the treatment and/or prevention of a variety of diseases and/or disorders in addition to obesity (see, Montana, J. G. International Application Publication No. WO 2004/058237; Lulla, A. et al., International Application Publication No. WO 2004/096202; Jerussi, T. P. et al., International Application Publication No. WO 02/060424; Senanayake, C. H. et al., International Application Publication No. WO 01/51453; Heal, D. J. International Application Publication No. WO 01/00205; Birch, A. M. et al., International Application Publication No. WO 01/00187; Mueller, P. International Application Publication No. WO 00/32178; Bailey, C. International Application Publication No. WO 98/11884; Kelly, P. International Application Publication No. WO 98/13034). For examples: treatment of nausea, emesis, and related conditions; cognitive dysfunctions; eating disorders; weight gain; irritable bowel syndrome; obsessive compulsive disorders; platelet adhesion; apnea, affective disorders such as attention deficit disorders, depression, and anxiety; male and female sexual function disorders; restless leg syndrome; osteoarthritis; substance abuse including nicotine and cocaine addiction; narcolepsy; pain such as neuropathic pain, diabetic neuropathy, and chronic pain; migraines; cerebral function disorders; chronic disorders such as premenstrual syndrome; and incontinence.

In general, sibutramine has a number of therapeutic benefits because of its unique pharmacological properties. However, sibutramine's therapeutic use for the treatment of obesity, and other diseases and disorders is currently not fully utilized because of certain limitations and adverse side effects associated with the drug. The major adverse events reported, in some cases life threatening, include increase in blood pressure and the side effects derived from the drug-drug interactions, for example, serotonin syndrome. The majority of these adverse events are, to some extent, metabolism-based. Sibutramine exerts its pharmacological actions predominantly via its secondary ( $M_1$ ) and primary ( $M_2$ ) amine metabolites. Sibutramine is metabolized in the liver principally by the cytochrome P450 (3A4) isozymes, to desmethyl metabolites,  $M_1$  and  $M_2$ . These active metabolites are further metabolized by hydroxylation and conjugation to pharmacologically inactive metabolites,  $M_5$  and  $M_6$ . The elimination half-lives of therapeutically active primary and secondary metabolites  $M_1$  and  $M_2$  are 14 and 16 hours, respectively. It is evident from a number of literature reports that cytochrome P450 mediated metabolism and the long half lives of active metabolites ( $M_1$  and  $M_2$ ) are to a great extent responsible for adverse events such as increased blood pressure and other side effects derived from drug-drug interactions of sibutramine.

Therefore, there is a need and great demand for safer and effective next generation appetite suppressants for the treatment of obesity. An ideal drug in this class should have potent appetite suppressant activity, a proven effect on fat loss, be

3

well tolerated during acute and chronic administration and have alleviated side effects when compared to sibutramine and phentermine.

The compounds of this invention described herein can have one or more of the following characteristics or properties:

1. Compounds of the invention can have dopamine transporter (DAT), norepinephrine transporter (NET) and serotonin transporter (SERT) inhibitory properties;
2. The primary metabolites, regardless of the electrophysiological properties of the parent drug, has, or have, negligible inhibitory activity at the IKr (HERG) channel at the normal therapeutic concentration of the parent drug in plasma (e.g. the concentration of the metabolite must be at least five times higher than the normal therapeutic concentration of the parent compound before activity at the IKr channel is observed);
3. Oral bioavailability of the compounds is consistent with oral administration using standard pharmacological oral formulations; however, the compounds, and compositions thereof, can also be administered using any delivery system that produces constant and controllable blood levels over time.

In some embodiments, the subject invention provides compounds having any two or more of the above identified characteristics or properties. In a preferred embodiment the compounds of the invention have all four characteristics or properties.

Additional modifications of the compounds disclosed herein can readily be made by those skilled in the art. Thus, analogs and salts of the exemplified compounds are within the scope of the subject invention. With knowledge of the compounds of the subject invention skilled chemists can use known procedures to synthesize these compounds from available substrates. As used in this application, the term "derivatives" refers to compounds which are substantially the same as another compound but which may have been modified by, for example, adding additional side groups. The term "derivatives" as used in this application also may refer to compounds which are substantially the same as another compound but which have atomic or molecular substitution at certain locations in the compound.

The subject invention further pertains to enantiomerically isolated compounds, and compositions comprising the compounds. The isolated enantiomeric forms of the compounds of the invention are substantially free from one another (i.e., in enantiomeric excess). In other words, the "R" forms of the compounds are substantially free from the "S" forms of the compounds and are, thus, in enantiomeric excess of the "S" forms. Conversely, "S" forms of the compounds are substantially free of "R" forms of the compounds and are, thus, in enantiomeric excess of the "R" forms. In one embodiment of the invention, the isolated enantiomeric compounds are at least about in 80% enantiomeric excess. In a preferred embodiment, the compounds are in at least about 90% enantiomeric excess. In a more preferred embodiment, the compounds are in at least about 95% enantiomeric excess. In an even more preferred embodiment, the compounds are in at least about 97% enantiomeric excess. In a most preferred

embodiment, the compounds are in at least 99% or greater than 99% enantiomeric excess.

#### Synthesis of the Compounds of the Invention

The compounds of the invention can be obtained via the synthetic methods illustrated in Schemes 1. Several methods have been described in the art for the synthesis of cycloalkylmethylamine analogs (see, e.g. Mattson, R. J. et al. U.S. Pat. No. 5,596,019; Lulla, A. et al., International Application Publication No. WO 2004/096202; Senanayake, C. H. et al., International Application Publication No. WO 02/083631; Vyas, S. K. et al., International Application Publication No. WO 02/36540; Jerussi, T. P. et al., International Application Publication No. WO 02/060424; Jeffery, J. E. et al., *J. Chem. Soc. Perkin Trans 1*, 1996, 2583-2589.). Other methods are known in the art for synthesizing cycloalkylmethylamines, which are readily accessible to the skilled artisan. The starting materials and intermediates used in the synthesis of target molecules (Scheme 1-4) thereof are commercially available or can be prepared by established procedures (See e.g., Green et al., "Protective Groups in Organic Synthesis," (Wiley™, 4<sup>th</sup> ed., 2006); Harrison et al "Compendium of Synthetic Organic Methods," vols. 1-8 (John Wiley and Sons, 1971-1996); "Beilstein Handbook of Organic Chemistry, Frankfurt, Germany; Feiser et al, "Reagents for Organic Synthesis,"

Volumes 1-45, Karger, 1991; March, *Advanced Organic Chemistry*, Wiley Interscience, 4<sup>th</sup> ed., 1992; Larock "Comprehensive Organic Transformations," Wiley-VCH Publishers, 2<sup>nd</sup> ed., 1999; Paquette, "Encyclopedia of Reagents for Organic Synthesis," John Wiley and Sons, 1<sup>st</sup> ed., 1995).

Accordingly, starting materials useful for preparing compounds of the invention and intermediates thereof are commercially available or can be prepared by well-known synthetic methods. Other methods for the synthesis of cycloalkylmethylamines described herein are either described in the art or will be readily apparent to the skilled artisan in view of the references provided above and may be used to synthesize the compounds of the invention. Accordingly, the methods presented in the Schemes herein are illustrative rather than comprehensive.

#### Methods

One general method for synthesis of compounds of Formulae (I) is described in Scheme 1. An appropriate substituted phenylacetonitrile (1) was reacted with dibromoalkane (2) in appropriate solvent (e.g., ether, THF, dioxane, DMF, DMSO) at a temperature between 10 and 100° C., preferably between 20 and 75° C. in the presence of a base (e.g., NaH, KOH) to give cycloalkylnitrile (3). The cycloalkylnitrile compounds were used to synthesize compounds (6) using a tandem Grignard-reduction method.

29

The typical procedure involves the reaction of a compound (3) with an appropriate Grignard reagent ( $R^3MgBr$ ) in presence of toluene at a gentle reflux temperature for 10 to 24 hours. Then the resulting adduct was subjected to reduction without any workup procedures using reducing agent like sodium borohydride according to a standard or an established procedure (see, Jeffery et al., J. Chem. Soc., Perkin Trans. 1, 1996, 2583-2589) to produce the corresponding cycloalkylmethylamine (6). The selected racemic amine (6) was separated into corresponding optically pure (R)- and (S)-isomers by a standard chiral crystallization method using optically pure tartaric acid. The target cycloalkylmethylamine derivatives (7) were synthesized by alkylation of amines (6) with

30

appropriate alkylating agents (8) or by reductive amination using appropriate aldehydes (9). The target compounds (7) were converted into corresponding hydrochloride salts (10) using hydrochloric acid (Scheme 1).

In one method cycloalkylmethylamine derivatives comprising Formula (I) was prepared as described in Scheme 2. The cycloalkylmethylamines (6) was alkylated with appropriate 4-nitrosulfonyl ester (18) at room temperature to get the corresponding cycloalkylmethylamine derivative (12) in moderate good yields. The compounds (12) were converted into hydrochloride salts by treating with 2N HCl solution in ether under standard conditions.

The key building blocks (18) used in the synthesis of cycloalkylmethylamine derivatives were synthesized in two steps as illustrated in scheme 3. The carboxylic acids 14 were heated with ethylene glycol in presence of catalytic amounts of sulfuric acid to get the corresponding esters (16) in nearly quantitative yields. The ethylene glycol esters (16) were treated with 4-nitrosulfonyl chloride (17) in presence of a mild base triethylamine in dichloromethane at 0° C. to get the corresponding alkylating agent (18) in good yields.

In another method cycloalkylmethylamine derivatives comprising Formula (I) was prepared as described in Scheme 4. The cycloalkylmethylamine 6 were alkylated with appropriate 4-nitrophenylsulfonyloxyethyl carbamate (19) as described for the synthesis cycloalkylmethylamine derivatives (12) in scheme 2 to get the corresponding carbamate derivatives (21) in moderate yields. The carbamate derivatives (21) were also prepared by reductive alkylation of amines (6) with appropriate aldehydes (20) under mild conditions in moderate to good yields (Scheme 4). The amine (6) was treated with aldehyde (2) in anhydrous methanol at room temperature for 15 hours followed by reacting with sodium borohydride (NaBH<sub>4</sub>) at 0° C. to get the corresponding carbamate derivative of cycloalkylmethylamine (21). The selected optically pure (R)-cycloalkylmethylamine derivatives (21c-d) were also prepared from the corresponding optically pure (R)-cycloalkylmethylamines. The selected racemic carbamate derivatives (21) were subjected to chiral HPLC separation to get the corresponding optically pure (R)- and (S)-carbamates.

P. et al., International Application Publication No. WO 02/060424; Senanayake, C. H. et al., International Application Publication No. WO 01/51453; Heal, D. J. International Application Publication No. WO 01/00205; Birch, A. M. et al., International Application Publication No. WO 01/00187; Mueller, P. International Application Publication No. WO 00/32178; Bailey, C. International Application Publication No. WO 98/11884; Kelly, P. International Application Publication No. WO 98/13034).

Thus, those of skill in the art may readily assay and use the compounds and/or compositions containing compound(s) of structural Formulae (I) to treat obesity and associated co-morbid diseases and/or disorders.

In various aspects, the present disclosure provides methods for treating or preventing depression in a patient, the method comprising administering to a patient in need of such treatment an effective amount of any one of the compounds of structural Formulae (I), (II), (III), (IV), (V), (VI), (VII), (VIII), (IX), (X), (XI), (XII), (XIII), (XIV), (XV), (XVI), or (XVII). In certain aspects, the compound is selected from any one of structural Formulae (I), (II), (X), (XI), (XII), (XIII), (XIV), (XV), (XVI), or (XVII). In further aspects, the compound is selected from any one of the compounds of EXAMPLES 1-87. In further aspects, the method further comprises treating a depression-related co-morbid symptom. Therapeutic/Prophylactic Administration

The compounds, and/or compositions containing compounds(s), of structural Formula (I) can be advantageously used in human medicine. As previously described in Section 4.4 above, compounds and compositions containing com-

pound(s) of structural Formulae (I) are useful for the treatment or prevention of obesity and associated co-morbid diseases and/or disorders.

When used to treat or prevent the above disease or disorders compounds and/or compositions of the invention can be administered or applied singly, in combination with other agents. The compounds and/or compositions of the invention can also be administered or applied singly, in combination with other pharmaceutically active agents, including other compounds and/or compositions of the invention.

The current invention provides methods of treatment and prophylaxis by administration to a patient of a therapeutically effective amount of a composition and/or compound of the invention. The patient may be an animal, is more preferably a mammal, and most preferably a human.

The present compounds and/or compositions of the invention, which comprise one or more compounds and/or compositions of the invention are preferably administered orally.

The compounds and/or compositions of the invention may also be administered by any other convenient route, for example, by infusion or bolus injection, by absorption through epithelial or mucocutaneous linings (e.g., oral mucosa, rectal and intestinal mucosa, etc.). Administration can be systemic or local. Various delivery systems are known, (e.g., encapsulation in liposomes, microparticles, microcapsules, capsules, etc.) that can be used to administer a compound and/or composition of the invention. Methods of administration include, but are not limited to, intradermal, intramuscular, intraperitoneal, intravenous, subcutaneous, intranasal, epidural, oral, sublingual, intranasal, intracerebral, intravaginal, transdermal, rectally, by inhalation, or topically, particularly to the ears, nose, eyes or skin.

In particularly, preferred embodiments, the compounds and/or compositions of the invention can be delivered via sustained release systems, preferably oral sustained release systems. In one embodiment, a pump may be used (see, Langer, supra; Sefton, 1987, CRC Crit. Ref Biomed. Eng. 14:201; Saudek et al., 1989, N. Engl. J. Med. 321:574).

In another embodiment, polymeric materials can be used (see "Medical Applications of Controlled Release," Langer and Wise (eds.), Wiley, New York (1984); Ranger and Peppas, 1983, J. Macromol. Sci. Rev. Macromol Chem. 23:61; see also Levy et al., 1985, Science 228:190; During et al., 1989, Ann. Neurol. 25:351; Howard et al., 1989, J. Neurosurg. 71:105). In a preferred embodiment, polymeric materials are used for oral sustained release delivery. Preferred polymers include sodium carboxymethylcellulose, hydroxypropylcellulose, hydroxypropylmethylcellulose and hydroxyethylcellulose (most preferred, hydroxypropylmethylcellulose). Other preferred cellulose ethers have been described in the art (Bamba et al., Int. J. Pharm., 1979, 2, 307).

In another embodiment, enteric-coated preparations can be used for oral sustained release administration. Preferred coating materials include polymers with a pH-dependent solubility (i.e., pH-controlled release), polymers with a slow or pH-dependent rate of swelling, dissolution or erosion (i.e., time controlled release), polymers that are degraded by enzymes (i.e., enzyme controlled release) and polymers that form firm layers that are destroyed by an increase in pressure (i.e., pressure-controlled release).

In still another embodiment, osmotic delivery systems are used for oral sustained release administration (Verma et al., Drug Dev. Ind. Pharm., 2000, 26:695-708). In a preferred embodiment, OROS® osmotic delivery systems sold by Alza Corporation of Mountain View, Calif. are used for oral sus-

tained release delivery devices (See for example, Theeuwes et al., U.S. Pat. No. 3,845,770; and Theeuwes et al, U.S. Pat. No. 3,916,899).

In yet another embodiment, a controlled-release system can be placed in proximity of the target of the compounds and/or composition of the invention, thus requiring only a fraction of the systemic dose (See, e.g., Goodson, in "Medical Applications of Controlled Release," supra, vol. 2, pp. 115-138 (1984)). Other controlled-release systems discussed in Langer, 1990, *Science* 249:1527-1533 may also be used.

The compounds, and/or compositions containing compound(s) of structural Formula (I) of the invention may be cleaved either chemically and/or enzymatically. One or more enzymes present in the stomach, intestinal lumen, intestinal tissue, blood, liver, brain or any other suitable tissue of a mammal may enzymatically cleave the compounds and/or compositions of the invention.

#### Compositions of the Invention

In various aspects, the present disclosure provides pharmaceutical compositions comprising any one of the compounds of structural Formulae (I), (II), (III), (IV), (V), (VI), (VII), (VIII), (IX), (X), (XI), (XII), (XIII), (XIV), (XV), (XVI), or (XVII) and a pharmaceutically acceptable carrier, excipient, or diluent.

The present composition contain a therapeutically effective amount of one or more compounds of the invention, preferably in purified form, together with a suitable amount of a pharmaceutically acceptable vehicle, which so as to provide the form for proper administration to a patient. When administered to a patient, the compounds of the invention and pharmaceutically acceptable vehicles are preferably sterile. Water is preferred vehicle when the compound of the invention is administered intravenously. Saline solutions and aqueous dextrose and glycerol solutions can also be employed as liquid vehicles, particularly for injectable solutions. Suitable pharmaceutical vehicles also include excipients such as starch, glucose, lactose, sucrose, gelatin, malt, rice, flour, chalk, silica gel, sodium stearate, glycerol monostearate, talc, sodium chloride, dried skim milk, glycerol, propylene, glycol, water, ethanol and the like. The present agents, or pH buffering agents. In addition, auxiliary, stabilizing, thickening, lubricating and coloring agents may be used.

Pharmaceutical compositions comprising a compound of the invention may be manufactured by means of conventional mixing, dissolving, granulating, dragee-making levigating, and emulsifying, encapsulating, entrapping or lyophilizing process. Pharmaceutical compositions may be formulated in conventional manner using one or more physiologically acceptable carriers, diluents, excipients or auxiliaries, which facilitate processing of compounds of the invention into preparations which can be used pharmaceutically. Proper formulation is dependent upon the route of administration chosen.

The present compositions can take the form of solutions, suspensions, emulsion, tablets, pills, pellets, and capsules, capsules containing liquids, powders, sustained-release formulations, suppositories, emulsions, aerosols, sprays, suspensions, or any other form suitable for use. In one embodiment, the pharmaceutically acceptable vehicle is a capsule (see e.g., Grosswald et al., U.S. Pat. No. 5,698,155). Other examples of suitable pharmaceutical vehicles have been described in the art (see Remington's *Pharmaceutical Sciences*, Philadelphia College of Pharmacy and Science, 17<sup>th</sup> Edition, 1985). Preferred compositions of the invention are formulated for oral delivery, particularly for oral sustained release administration.

Compositions for oral delivery may be in the form of tablets, lozenges, aqueous or oily suspensions, granules, powders, emulsions, capsules, syrups or elixirs, for example. Orally administered compositions may contain one or more optionally agents, for example, sweetening agents such as fructose, aspartame or saccharin; flavoring agents such as peppermint, oil of wintergreen, or cherry coloring agents and preserving agents to provide a pharmaceutically palatable preparation. Moreover, where in tablet or pill form, the compositions may be coated to delay disintegration and absorption in the gastrointestinal tract, thereby providing a sustained action over an extended period of time. Selectively permeable membranes surrounding an osmotically active driving compound are also suitable for orally administered compounds of the invention. In these later platforms, fluid from the environment surrounding the capsule is imbibed by the driving compound, which swells to displace the agent or agent composition through an aperture. These delivery platforms can provide an essentially zero order delivery profile as opposed to the spiked profiles of immediate release formulations. A time delay material such as glycerol monostearate or glycerol stearate may also be used. Oral compositions can include standard vehicles such as mannitol, lactose, starch, magnesium stearate, sodium saccharine, cellulose, magnesium carbonate, etc. Such vehicles are preferably of pharmaceutical grade.

For oral liquid preparations such as, for example, suspensions, elixirs and solutions, suitable carriers, excipients or diluents include water, saline, alkylene glycols (e.g., propylene glycol), polyalkylene glycols (e.g., polyethylene glycol) oils, alcohols, slightly acidic buffers between pH 4 and pH 6 (e.g., acetate, citrate, ascorbate at between about mM to about 50 mM) etc. Additionally, flavoring agents, preservatives, coloring agents, bile salts, acylcamitines and the like may be added.

Compositions for administration via other routes may also be contemplated. For buccal administration, the compositions may take the form of tablets, lozenges, etc. formulated in conventional manner. Liquid drug formulations suitable for use with nebulizers and liquid spray devices and EHD aerosol devices will typically include a compound of the invention with a pharmaceutically acceptable vehicle. Preferably, the pharmaceutically acceptable vehicle is a liquid such as alcohol, water, polyethylene glycol or a perfluorocarbon. Optionally, another material may be added to alter the aerosol properties of the solution or suspension of compounds of the invention. Preferably, this material is liquid such as alcohol, glycol, polyglycol or fatty acid. Other methods of formulating liquid drug solutions or suspension suitable for use in aerosol devices are known to those of skill in the art (see, e.g., Biesalski, U.S. Pat. No. 5,112,598; Biesalski, U.S. Pat. No. 5,556,611). A compound of the invention may also be formulated in rectal or vaginal compositions such as suppositories or retention enemas, e.g., containing conventional suppository bases such as cocoa, butter or other glycerides. In addition to the formulations described previously, a compound of the invention may also be formulated as depot preparation. Such long acting formulations may be administered by implantation (for example, subcutaneously or intramuscularly) or by intramuscular injection. Thus, for example, a compound of the invention may be formulated with suitable polymeric or hydrophobic materials (for example, as an emulsion in an acceptable oil) or ion exchange resins, or as sparingly soluble derivatives, for example, as a sparingly soluble salt.

When a compound of the invention is acidic, it may be included in any of the above-described formulations as the

free acid, a pharmaceutically acceptable salt, a solvate or hydrate. Pharmaceutically acceptable salts substantially retain the activity of the free acid, may be prepared by reaction with bases and tend to be more soluble in aqueous and other protic solvents than the corresponding free acid form.

#### General Procedure for Synthesis of Compounds 6a-g (Scheme 1)

To a stirred solution of Grignard reagent (2M solution in ether, 0.065 mol) under nitrogen atmosphere was added drop wise a solution of phenylcyclobutanecarbonitrile (0.026 mol) in 50 mL of toluene at 0° C. Then the reaction mixture was slowly heated at 92° C. for 18 h. The progress of the reaction was monitored by thin layer chromatography (TLC). The reaction mixture was cooled to room temperature and concentrated under reduced pressure. The residue was diluted with 30 mL of anhydrous methanol and cooled down at 0° C., and NaBH<sub>4</sub> (2.5 g) was added slowly portion wise. The resulting mixture was stirred until complete conversion of imine intermediate to the corresponding amine. After the reaction was completed, methanol was removed by evaporation. The residue was diluted with ethyl acetate, washed with saturated sodium bicarbonate, dried over MgSO<sub>4</sub> and evaporated under reduce pressure to give corresponding phenylcyclobutylm-

ethylamine 6 which was purified by column chromatography on silica gel using a gradient of hexane and ethyl acetate. The pure products 6a-g gave satisfactory <sup>1</sup>H NMR and/or Mass spectral data.

To a suspension of isobutyric acid (5 g, 0.056 mol) and ethylene glycol (15.8 g, 0.283 mol.) was added dropwise Sulfuric acid (cat. 0.4 mL). The resulting mixture was heated at 80° C. for 4 hrs. ## General Procedure for Synthesis of Compounds 21a-j

A solution of appropriate phenylcyclobutylmethylamine 6 (0.0009 mol) and carbamate (0.0009 mol) in methanol anhydrous (10 mL) was stirred for 15 hours at room temperature. After the reaction was complete, the reaction mixture was cooled down to 0° C. and NaBH<sub>4</sub> (0.36 g, 5.0 eq) was added. The reaction mixture was stirred for 6 hours from 0° C. to rt. And then NaHCO<sub>3</sub> solution was added. The product was extracted with ethyl acetate, dried over anhydrous Na<sub>2</sub>SO<sub>4</sub> and evaporated under reduced pressure to give ethyl corresponding phenylcyclobutylmethylamine carbamate 21 which

was purified by silica gel column chromatography using gradient of hexane and ethyl acetate, isolated as a colorless thick oil in 46-66% yield.

The optical pur (R)-carbamates 21c-d were prepared by using corresponding starting optically pur (R)-amine 6e-f. under identical reaction conditions. The selected carbamates 21a-b were also synthesized by alternate route by alkylating corresponding amine 6e-i with carbamate 19 as described in scheme 4

## General Procedure for Synthesis of Compounds 19

To a stirred solution of cesium carbonate (3.5 g, 5 eq) in 5 mL of DMF(anhydrous) was added amine 6e-f (0.6 g, 0.0022 mol. 1 eq) and the resulting mixture was stirred at room temperature for 4 hrs. Then 2-((ethoxycarbonyl)amino)ethyl nitrobenzenesulfonate (0.0091 mol. 4 eq) was added. The resulting mixture was stirred at room temperature for two days. The progress of the reaction was monitored by thin layer chromatography (TLC). The reaction mixture was filtered, diluted with 10 mL of ethyl acetate, washed with brine and dried over Na<sub>2</sub>SO<sub>4</sub>, evaporated to give the corresponding amine carbamate which was purified by silica gel column chromatography using gradient of DCM/MeOH, isolated as a thick oil with 20-40% yield.
