See application file for complete search history.

Disclosed are various embodiments relating to generating profile-based groups to obtain item suggestions. A network page is rendered in a client computing device comprising a topic field to input a topic and a third party criteria selection mechanism to select at least one third party user. The user inputs the topic and the third party criteria. A request for suggestions relating to the topic is then sent from the client computing device to a server computing device.

FIG. 3

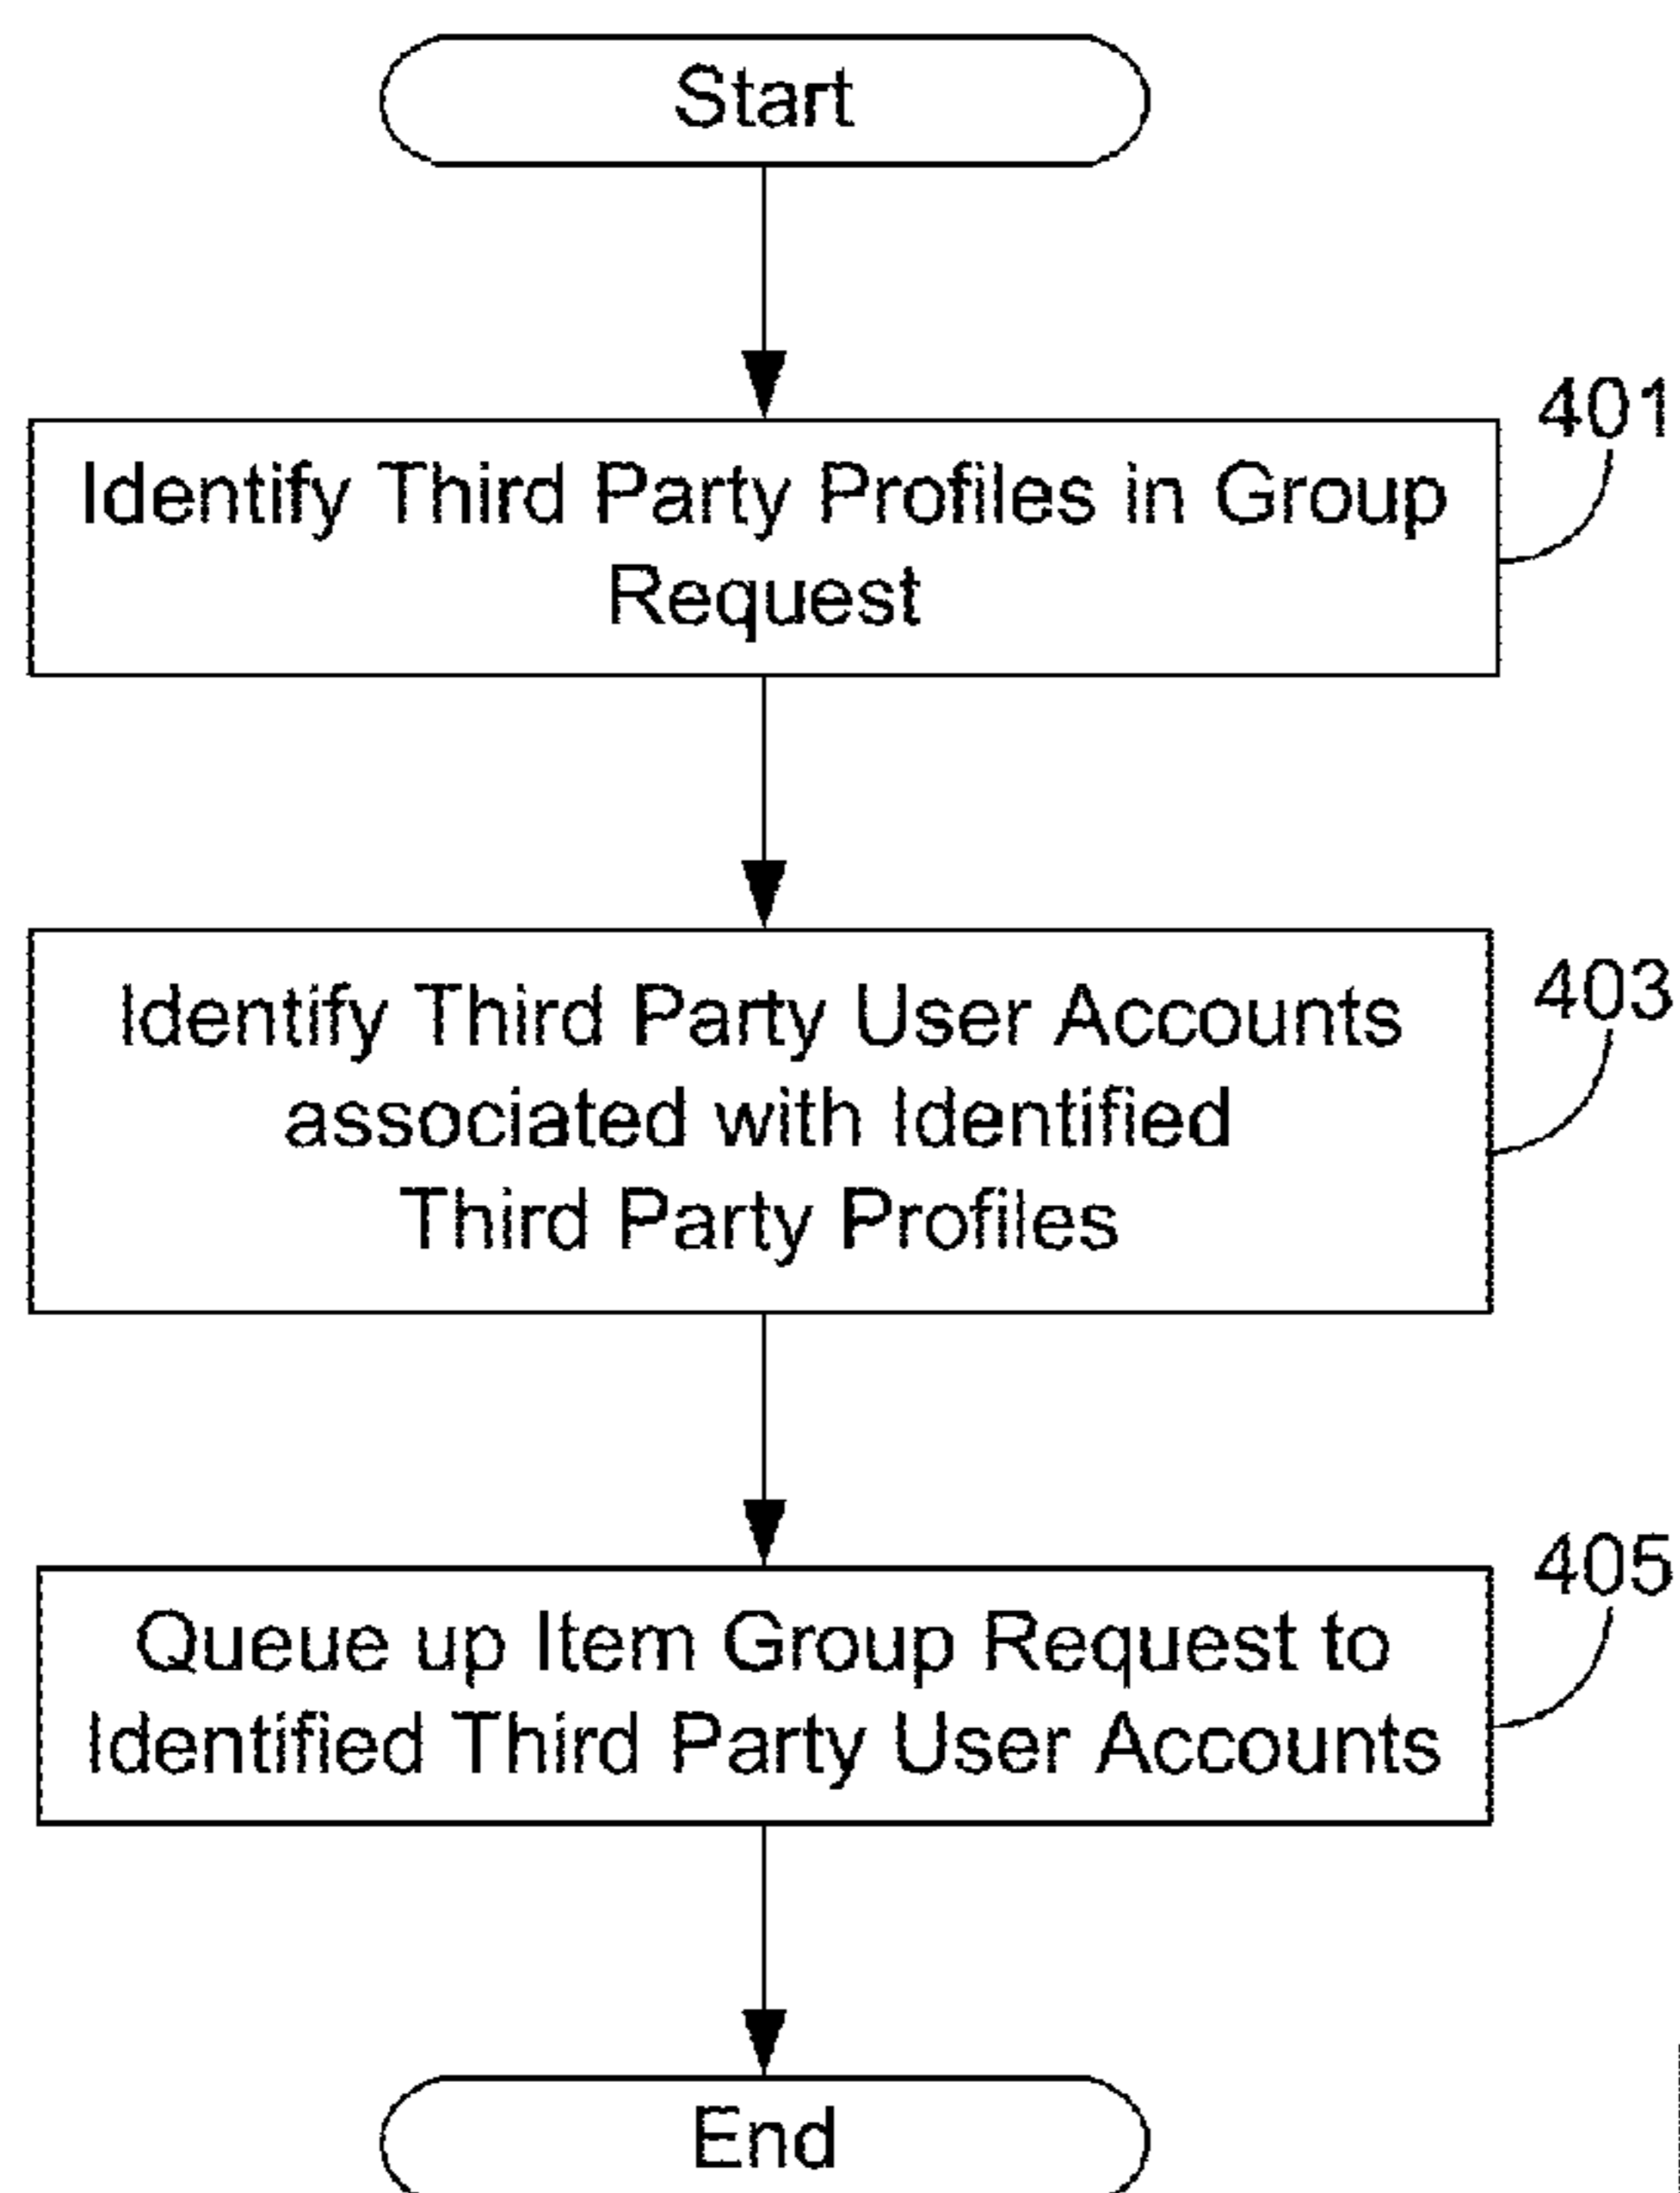

FIG. 4A

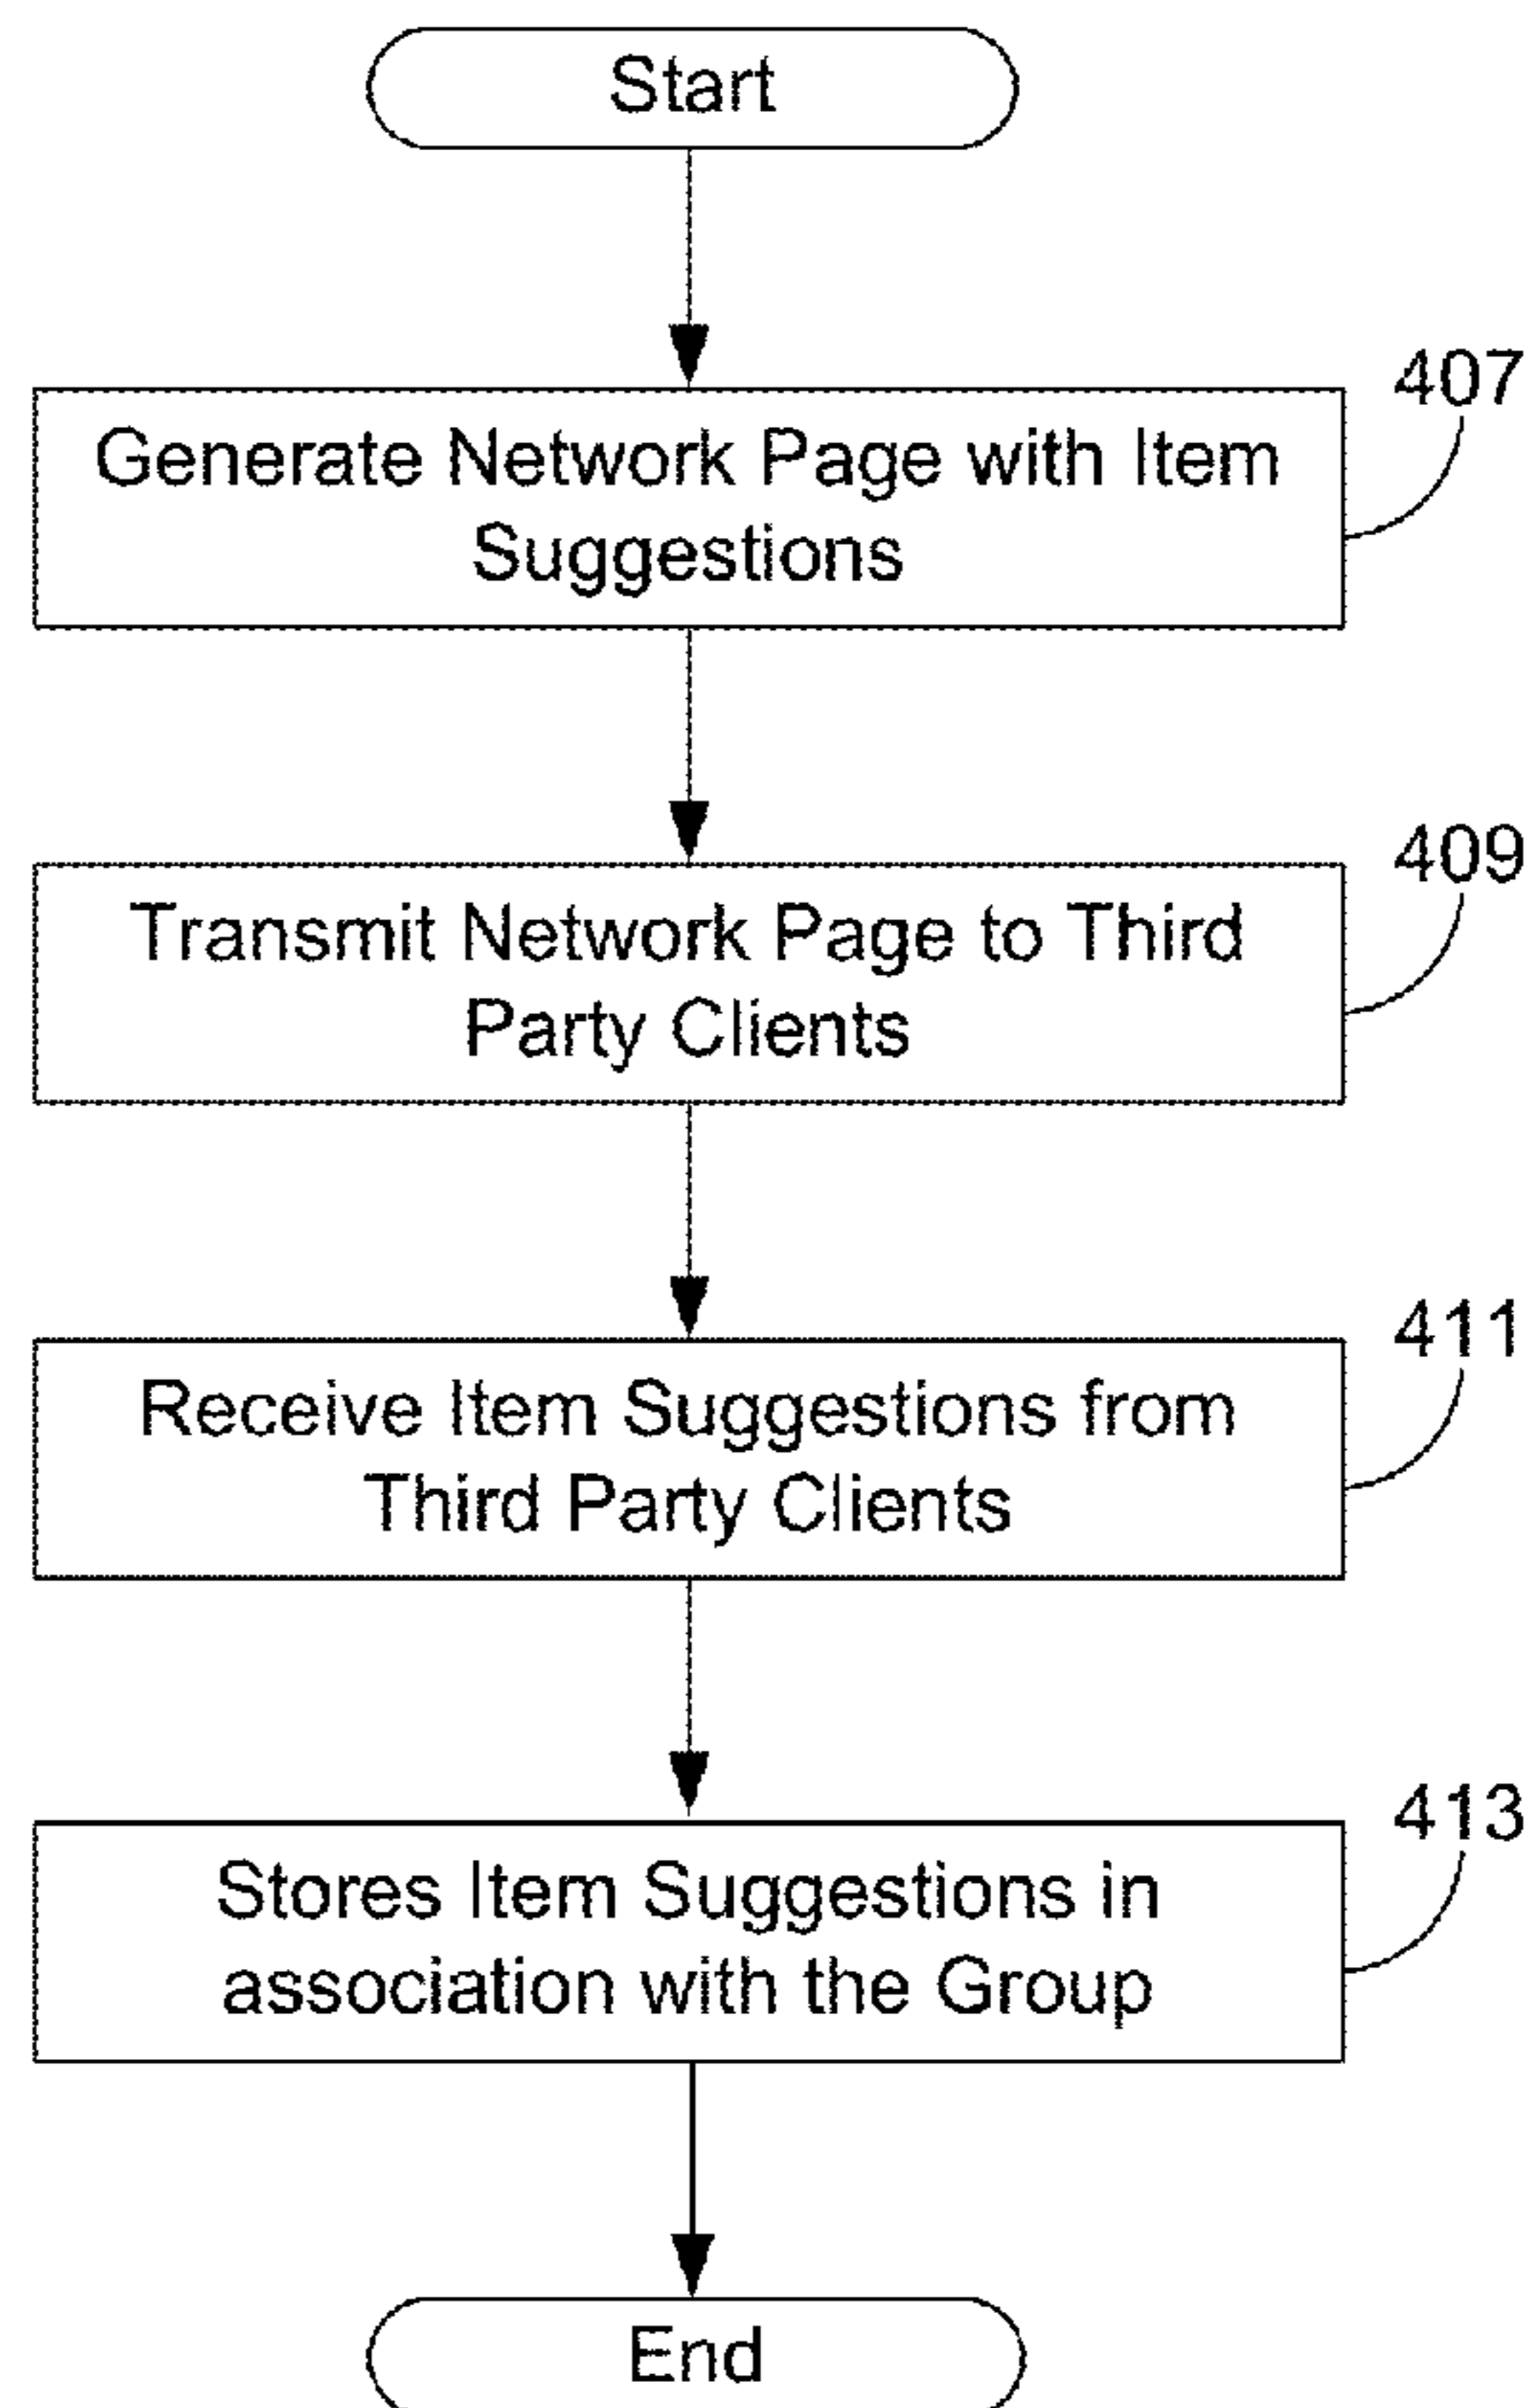

FIG. 4B

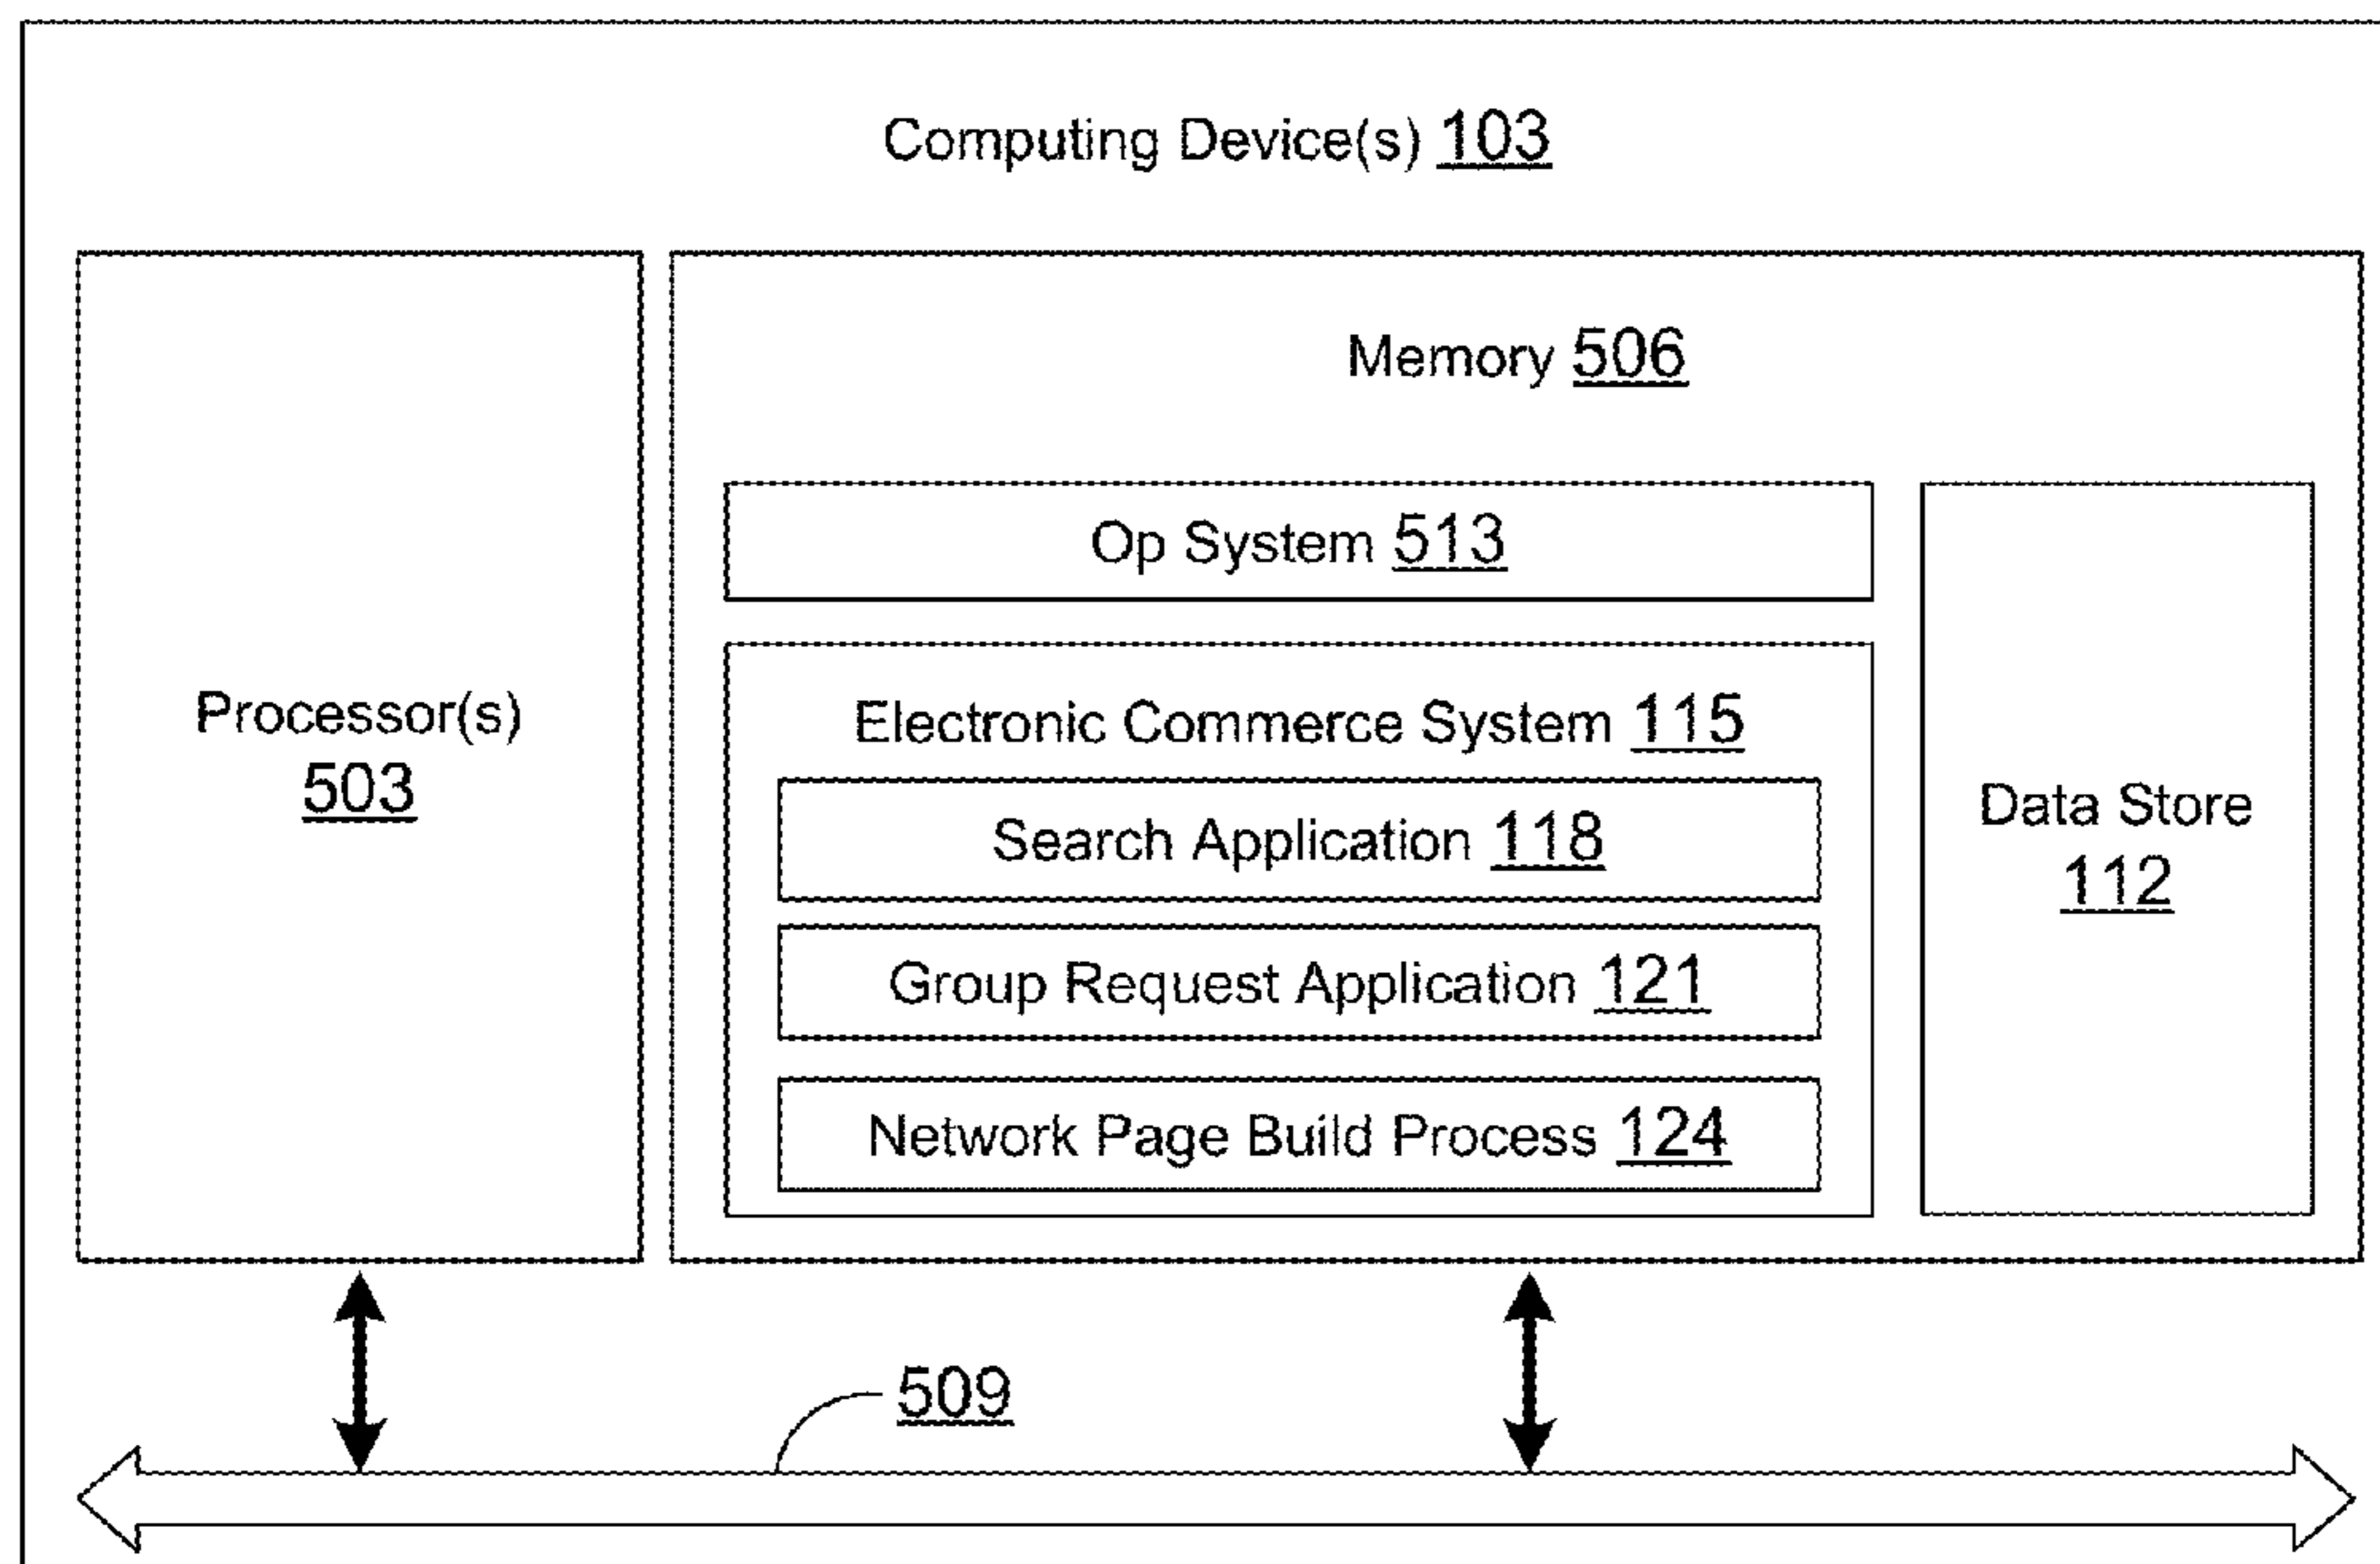

FIG. 5

GENERATING ITEM SUGGESTIONS FROM A PROFILE-BASED GROUP

BACKGROUND

People often purchase clothing items or accessories online in their own homes. However, often times they are not able to obtain suggestions from a group of people similar to themselves.

BRIEF DESCRIPTION OF THE DRAWINGS

Many aspects of the present disclosure can be better understood with reference to the following drawings. The components in the drawings are not necessarily to scale, emphasis instead being placed upon clearly illustrating the principles of the disclosure. Moreover, in the drawings, like reference numerals designate corresponding parts throughout the several views.

FIG. 1 is a drawing of a networked environment according to various embodiments of the present disclosure.

FIG. 2 is a diagram of an example of a network page rendered in a client in the networked environment of FIG. 1 according to various embodiments of the present disclosure.

FIG. 3 is a diagram of another example of a network page rendered in a client in the networked environment of FIG. 1 according to various embodiments of the present disclosure.

FIGS. 4A-4B are flowcharts illustrating examples of the functionality of a group request application executed in a computing device in the networked environment of FIG. 1 according to various embodiments of the present disclosure.

FIG. 5 is a schematic block diagram that provides one example illustration of a computing device employed in the networked environment of FIG. 1 according to various embodiments of the present disclosure.

DETAILED DESCRIPTION

Various embodiments of the present disclosure relate to generating profile-based groups to obtain item suggestions when purchasing clothing items or accessories through an electronic commerce system. A user with a user account with one or more profiles may wish to create a group to obtain suggestions from others having one or more profiles similar to that of the user. To do so, the user may generate a group request by specifying a topic and selecting third parties having profiles that are similar to, or otherwise aligned with, one or more profiles of the user. In response to the group request, the third parties may input suggestions for the user and members of the group to view. In the following discussion, a general description of the system and its components is provided, followed by a discussion of the operation of the same.

With reference to FIG. 1, shown is a networked environment 100 according to various embodiments. The networked environment 100 includes a computing device 103, clients 106a, third party clients 106b, and a network 109. The network 109 includes, for example, the Internet, intranets, extranets, wide area networks (WANs), local area networks (LANs), wired networks, wireless networks, or other suitable networks, etc., or any combination of two or more such networks.

The computing device 103 may comprise, for example, a server computer or any other system providing computing capability. Alternatively, a plurality of computing devices 103 may be employed that are arranged, for example, in one or more server banks or computer banks or other arrangements. For example, a plurality of computing devices 103 together

may comprise a cloud computing resource, a grid computing resource, and/or any other distributed computing arrangement. Such computing devices 103 may be located in a single installation or may be distributed among many different geographical locations. For purposes of convenience, the computing device 103 is referred to herein in the singular. Even though the computing device is referred to in the singular, it is understood that a plurality of computing devices 103 may be employed in the various arrangements as described above.

Various applications and/or other functionality may be executed in the computing device 103 according to various embodiments. Also, various data is stored in a data store 112 that is accessible to the computing device 103. The data store 112 may be representative of a plurality of data stores as can be appreciated. The data stored in the data store 112, for example, is associated with the operation of the various applications and/or functional entities described below.

The components executed on the computing device 103, for example, include an electronic commerce system 115 and other applications, services, processes, systems, engines, or functionality not discussed in detail herein. The electronic commerce system 115 includes various components such as a search application 118, a group request application 121, a network page build process 124, and other applications and/or processes.

The electronic commerce system 115 is executed in order to facilitate the online purchase of items 133, such as, goods and/or services, over the network 109. The electronic commerce system 115 also performs various back-end functions associated with the online presence of a merchant in order to facilitate the online purchase of items 133 as will be described. For example, the electronic commerce system 115 may generate various network pages 159, such as web pages, or other types of network content, using the network page build process 124, that are provided to clients 106a and third party clients 106b for the purposes of selecting items 133 for purchase, rental, download, lease, or other form of consumption as will be described. The electronic commerce system 115 further includes a search application 118 and/or other applications useful to facilitate searching through a catalog of items to conduct electronic commerce.

The group request application 121 generates one or more network pages 159 in order to obtain item suggestions from a user and one or more third party users associated with one or more third party profiles as will be described. As used herein, the term “third party” refers to customers other than a subject user, as will be described. The group request application 121 may also generate one or more additional network pages 159 to view item suggestions as discussed below.

The data stored in the data store 112 includes, for example, a catalog 131 of items 133, user accounts 141, and potentially other data. The catalog 131 includes a listing of items 133 that are described by item data 137 and offered for sale by an online merchant. As used herein, the term “item” 133 may refer to a product, good, service, bundle of products, goods and/or services that may be offered for sale, purchase, rental, lease, download, and/or any other form of consumption, as can be appreciated. The item data 137 describes each of the items 133 and may comprise, for example, titles, descriptions, quantities, images, representations, options, weights, customer reviews, customer ratings, keywords, tags, shipping restrictions, prices, tax classifications, categories, unique identifiers, and any other data related to items 133.

Each user account 141 is associated with a respective user and may include a shipping address, an electronic mail (e-mail) address, shipping information, payment information, a purchasing history, a browsing history, and other data

related to the user. In addition, each of the user accounts **141** may comprise one or more profiles **143** created by the user. In one embodiment, each of the profiles **143** is associated with, or describes, for example, a role of a given user and may comprise profile elements **146** that may include text, images, ratings, scores, and potentially other data that describes the profile **143**.

Additionally, a user may generate a group request **151** in order to create a group **153** to generate item suggestions **157** from one or more third party users associated with one or more third party profiles **143** as will be described. In one embodiment, the group **153** and the item suggestions **157** may be stored in association with the user accounts **141** of the user and third party users of the group **153**.

Lastly, the client **106a** and third party client **106b** are representative of a plurality of client devices that may be coupled to the network **109**. The client **106a** and third party client **106b** may comprise, for example, a processor-based systems such as a computer system. Such a computer system may be embodied in the form of a desktop computer, a laptop computer, a personal digital assistant, a cellular telephone, set-top box, music players, web pads, tablet computer systems, game consoles, or other devices with like capability.

The client **106a** and third party client **106b** may be configured to execute various applications such as a browser **161a** and browser **161b**, respectively, and/or other applications. The browser **161a** and browser **161b** may be executed in a client **106a** or third party client **106b**, respectively, for example, to access and render network pages **159**, such as, web pages, or other network content served up by the computing device **103** and/or other servers. Alternatively, a mobile application may be executed in a client **106a** or a third party client **106b** to generate and render user interfaces using data served up by the computing device **103** and/or other servers. Alternatively, when rendered, the network pages **159** generate a user interface as can be appreciated. The client **106a** or third party client **106b** may be configured to execute applications beyond the browser **161a** and browser **161b**, respectively, such as, for example, email applications, instant message applications, and/or other applications.

When executed in a client **106a** or third party client **106b**, the browser **161a** and browser **161b**, respectively, render network pages **159** on a respective display **163a** or display **163b** and may perform other functions. The browser **161a** and browser **161b**, respectively, access network pages **159**, such as web pages or other types of content from the computing device **103** in order to access the functionality of the search application **118**, and other components implemented in the computing device **103** as will be described.

Next, a general description of the operation of the various components of the networked environment **100** is provided. To begin, assume a user of a client **106a** has a user account **141** with a merchant and would like to create one or more profiles **143** comprising profile elements **146**. To do so, the user may navigate to one or more network pages **159** served up by the electronic commerce system **115** to facilitate the input of profile elements **146** that make up the respective profile **143**.

In one embodiment, such network pages **159** may present a questionnaire with text fields for the user to input the profile elements **146**. In another embodiment, such network pages **159** may comprise selection mechanisms, such as, for example, pick lists or toggle mechanisms, to facilitate the input of the profile elements **146** by allowing the user to select options or other information that describes the profile **143**. In this manner, many users may generate their own profiles **143** that describe the roles they take on in their daily lives.

For example, a user may wish to create a “Work” profile **143** that represents the user’s role as a business woman, a “Party” profile **143** that represents the use’s role in social settings, and a “Mom” profile **143** that represents the user’s role as a mother, and other profiles may be created. In this example, for the “Work” profile **143** the user may select the profile element **146** entitled “Young Professional” from a pick list entitled “Life Stage” and the profile element **146** entitled “Nurse” from a pick list entitled “Occupation”.

After creating one or more profiles **143**, assume that the user wishes to create a group **153** to obtain item suggestions **157** from third party users having one or more third party profiles **143** that are similar to one or more of profiles **143** of the user. To do so, the user of a client **106a** navigates to one or more network pages **159** that facilitate generating a group request **151**. In one embodiment, the network page **159** may comprise, for example, a profile selection mechanism to specify a profile **143**, a topic field to input a topic, and a third party profile criteria pick list to specify criteria that is used to identify one or more third party profiles **143** to invite or otherwise include to the group **153**.

For example, a user may have selected a “Work” profile **143** from the profile selection mechanism, inputted “Fashion Advice for New Moms” into the topic field and selected “Work Profile with 50% similarity” and “Mom Profile with 50% similarity” from the third party profile criteria pick list. In this example, the user is creating a group **153** to discuss fashion suggestions for new moms and inviting third party users with third party profiles **143** that are 50% similar to the user’s “Work” profile **143** and 50% similar to the user’s “Mom” profile **143** to join the group **153**.

After inputting information in the network page **159**, the user may then send the group request **151** to the computing device **103** through network **109** by clicking on an appropriate button or link. Thereafter, the group request application **121** may identify the third party users associated with third party profiles **143** matching criteria identified in the group request **151**. In the example above, the group request application **121** may, in one embodiment, use the profile elements **146** associated with the “Work” profile **143** and the “Mom” profile **143** of the user to identify the third party users having third party profiles **143** comprising third party profile elements **146** that are 50% similar to the profile elements **146** of the user’s “Work” profile **143** and 50% similar to the profile elements **146** of the user’s “Mom” profile **143**.

In one embodiment, the group request application **121** may use the profile elements **146** of the user’s profiles **143** to identify the third party users associated with third party profiles **143** matching criteria identified in the group request **151**. For example, a user may have selected the option entitled “Young Professional” from a pick list to describe the life stage of the “Work” profile **143**. In this example, the group request application **121** may then use the “Young Professional” profile element **146** to identify the third party profiles **143** that have a “Young Professional” profile element **146**.

In some cases, however, a user may have entered a paragraph or other quantity of text in response to a question about a profile **143**. In this case, the group request application **121** may extract important terms to use as profile elements **146** by identifying capitalized words, grammatically emphasized words, words that appear with at least a statistically significant frequency, and other types of words that may be considered important. In one embodiment, the group request application **121** may then use the extracted profile elements **146** of a user’s profile **143** to identify the third party users associated with third party profiles **143** with identical or similar profile elements **146** based on the percent similarity specified.

For instance, in association with a “Party” profile 143, suppose a user has inputted “HALLE BERRY!!, she always look so put together, classic, and simple. I also like CAMERON DIAZ, trendy and fresh. I also like JENNIFER ANNISTON’S style” in response to a question about which celebrities are liked by the user. The group request application 121 may then extract profile elements 146 entitled, for example, “Halle Berry”, “Cameron Diaz” and “Jennifer Anniston” because these words are capitalized by the user. In this case, the group request application 121 may then use the words “Halle Berry”, “Cameron Diaz” and/or “Jennifer Anniston” to search third party profile elements 146 comprising the words “Halle Berry”, “Cameron Diaz, and/or “Jennifer Anniston”. Upon identifying the third party users associated with third party profiles 143 matching the criteria identified in the group request 151, the group request application 121 may then queue up the group request 151 to the identified third party users on third party clients 106b through a network 109. In one embodiment, the third party users may accept or decline the group request 151 by selecting an appropriate link or button. Thereafter, the third party users may navigate through various network pages 159 to input item suggestions 157 viewable by the user that created the group 153 and other third party users that joined the group 153.

Specifically, the group request application 121 may encode for display one or more network pages 159 to send to the third party clients 106b through the network 109 to facilitate an input of item suggestions 157. The item suggestions 157 may comprise, for example, ratings, text, images, representations, opinions, weights, reviews, ratings, and any other feedback related to the topic of the group 153. In one embodiment, the item suggestions 157 may comprise feedback that relates to items 133 sold through the electronic commerce system 115.

Subsequently, the user that created the group request and the third party users associated with the group 153 may wish to view item suggestions 157. To do so, the user of a client 106a, or the third party users of clients 106b, may navigate through one or more network pages 159 to view the item suggestions 157. In one embodiment, the group request application 121 may store the item suggestions 157 in association with the user accounts 141 of the user and third party users in the data store 112. The third party profiles 143 that join the group 153 are associated with the user accounts 141.

FIG. 2 illustrates a non-limiting example of a network page 159, denoted herein as network page 159a, configured to generate a group request 151 (FIG. 1).

As a non-limiting example, in FIG. 2, the network page 159a includes a profile selection mechanism 171 to select one or more profiles 143 (FIG. 1), a topic field 173, and a third party profile pick lists 175 to select one or more third party users associated with one or more third party profiles 143.

As shown in FIG. 2, a user has selected a “Work” profile 143 from the profile selection mechanism 171, specified the topic entitled “Fashion advice for New Moms” in the topic field 173, and selected the pick list entitled “Work Profile with 50% Similarity” and “Mom Profile with 50% Similarity” from the third party profile pick lists 175. In this non-limiting example, the user is creating a group 153 to discuss fashion advice for new moms and inviting third party users associated with third party profiles 143 that are 50% similar to the user’s “Work” profile 143 and 50% similar to the user’s “Mom” profile 143.

FIG. 3 illustrates a non-limiting example of a network page 159, denoted herein as network page 159b, comprising item suggestions 157 (FIG. 1) from one or more third party users.

As a non-limiting example, as shown in FIG. 3, three third party users (e.g. “MominKansas”, “SamJones”, and “Char-

lotteYork”) have submitted group suggestions 151a-151c, respectively, in response to a group suggestions request 151 (FIG. 1).

Referring next to FIG. 4A, shown is a flowchart that provides one example of the operation of a portion of the group request application 121 (FIG. 1) according to various embodiments. It is understood that the flowchart of FIG. 4A provides merely an example of the many different types of functional arrangements that may be employed to implement the operation of the portion of the group request application 121 as described herein. As an alternative, the flowchart of FIG. 4A may be viewed as depicting an example of steps of a method implemented in the computing device 103 (FIG. 1) according to one or more embodiments.

The flowchart of FIG. 4A shows one example of a portion of the group request application 121 that is implemented in response to a user generating a group request 151 (FIG. 1) as described above. To begin, in box 401, the group request application 121 identifies one or more third party profiles 143 (FIG. 1) matching criteria specified in a group request 151 (FIG. 1). Then, in box 403, the group request application 121 identifies one or more third party user accounts 141 (FIG. 1) associated with one or more third party profiles 143 identified in box 401. Lastly, in box 405, the group request application 121 queues up the group request 151 (FIG. 1) to the one or more third parties accounts identified in box 403.

Referring next to FIG. 4B, shown is a flowchart that provides one example of the operation of a portion of the group request application 121 according to various embodiments. It is understood that the flowchart of FIG. 4B provides merely an example of the many different types of functional arrangements that may be employed to implement the operation of the portion of the group request application 121 as described herein. As an alternative, the flowchart of FIG. 4B may be viewed as depicting an example of steps of a method implemented in the computing device 103 (FIG. 1) according to one or more embodiments.

The flowchart of FIG. 4B shows one example of a portion of the group request application 121 that is implemented in response to obtaining item suggestions 157 (FIG. 1) from third party users as described above. To begin, in box 407, the group request application 121 generates one or more network pages 159 (FIG. 1) to obtain item suggestions 157 from one or more third party users associated with one or more third party profiles 143 specified in a group request 151 (FIG. 1). Then, in box 409, the group request application 121 transmits the network page 159 to one or more third party clients 106b (FIG. 1). Thereafter, in box 411, the group request application 121 receives item suggestions 157 from one or more third party clients 106b. Lastly, in box 413, the group request application 121 stores the item suggestions 157 in association with a group 153 (FIG. 1).

With reference to FIG. 5, shown is a schematic block diagram of the computing device 103 according to an embodiment of the present disclosure. The computing device 103 includes at least one processor circuit, for example, having a processor 503 and a memory 506, both of which are coupled to a local interface 509. To this end, the computing device 103 may comprise, for example, at least one server computer or like device. The local interface 509 may comprise, for example, a data bus with an accompanying address/control bus or other bus structure as can be appreciated.

Stored in the memory 506 are both data and several components that are executable by the processor 503. In particular, stored in the memory 506 and executable by the processor 503 are an electronic commerce system 115, a search application 118, a group request application 121, a network build

process 124, and potentially other applications. Also stored in the memory 506 may be a data store 112 and other data. In addition, an operating system 513 may be stored in the memory 506 and executable by the processor 503.

It is understood that there may be other applications that are stored in the memory 506 and are executable by the processors 503 as can be appreciated. Where any component discussed herein is implemented in the form of software, any one of a number of programming languages may be employed such as, for example, C, C++, C#, Objective C, Java, JavaScript, Perl, PHP, Visual Basic, Python, Ruby, Delphi, Flash, or other programming languages.

A number of software components are stored in the memory 506 and are executable by the processor 503. In this respect, the term “executable” means a program file that is in a form that can ultimately be run by the processor 503. Examples of executable programs may be, for example, a compiled program that can be translated into machine code in a format that can be loaded into a random access portion of the memory 506 and run by the processor 503, source code that may be expressed in proper format such as object code that is capable of being loaded into a random access portion of the memory 506 and executed by the processor 503, or source code that may be interpreted by another executable program to generate instructions in a random access portion of the memory 506 to be executed by the processor 503, etc. An executable program may be stored in any portion or component of the memory 506 including, for example, random access memory (RAM), read-only memory (ROM), hard drive, solid-state drive, USB flash drive, memory card, optical disc such as compact disc (CD) or digital versatile disc (DVD), floppy disk, magnetic tape, or other memory components.

The memory 506 is defined herein as including both volatile and nonvolatile memory and data storage components. Volatile components are those that do not retain data values upon loss of power. Nonvolatile components are those that retain data upon a loss of power. Thus, the memory 506 may comprise, for example, random access memory (RAM), read-only memory (ROM), hard disk drives, solid-state drives, USB flash drives, memory cards accessed via a memory card reader, floppy disks accessed via an associated floppy disk drive, optical discs accessed via an optical disc drive, magnetic tapes accessed via an appropriate tape drive, and/or other memory components, or a combination of any two or more of these memory components. In addition, the RAM may comprise, for example, static random access memory (SRAM), dynamic random access memory (DRAM), or magnetic random access memory (MRAM) and other such devices. The ROM may comprise, for example, a programmable read-only memory (PROM), an erasable programmable read-only memory (EPROM), an electrically erasable programmable read-only memory (EEPROM), or other like memory devices.

Also, the processor 503 may represent multiple processors 503 and the memory 506 may represent multiple memories 506 that operate in parallel processing circuits, respectively. In such a case, the local interface 509 may be an appropriate network 109 (FIG. 1) that facilitates communication between any two of the multiple processors 503, between any processor 503 and any of the memories 506, or between any two of the memories 506, etc. The local interface 509 may comprise additional systems designed to coordinate this communication, including, for example, performing load balancing. The processor 503 may be of electrical or of some other available construction.

Although an electronic commerce system 115, a search application 118, a group request application 121, a network build process 124, and other various systems described herein may be embodied in software or code executed by general purpose hardware as discussed above, as an alternative the same may also be embodied in dedicated hardware or a combination of software/general purpose hardware and dedicated hardware. If embodied in dedicated hardware, each can be implemented as a circuit or state machine that employs any one of or a combination of a number of technologies. These technologies may include, but are not limited to, discrete logic circuits having logic gates for implementing various logic functions upon an application of one or more data signals, application specific integrated circuits having appropriate logic gates, or other components, etc. Such technologies are generally well known by those skilled in the art and, consequently, are not described in detail herein.

The flowcharts of FIGS. 4A and 4B show the functionality and operation of an implementation of portions of the group request application 121. If embodied in software, each block may represent a module, segment, or portion of code that comprises program instructions to implement the specified logical function(s). The program instructions may be embodied in the form of source code that comprises human-readable statements written in a programming language or machine code that comprises numerical instructions recognizable by a suitable execution system such as a processor 503 in a computer system or other system. The machine code may be converted from the source code, etc. If embodied in hardware, each block may represent a circuit or a number of interconnected circuits to implement the specified logical function(s).

Although the flowcharts of FIGS. 4A and 4B show a specific order of execution, it is understood that the order of execution may differ from that which is depicted. For example, the order of execution of two or more blocks may be scrambled relative to the order shown. Also, two or more blocks shown in succession in FIGS. 4A and 4B may be executed concurrently or with partial concurrence. Further, in some embodiments, one or more of the blocks shown in FIGS. 5A and 5B may be skipped or omitted. In addition, any number of counters, state variables, warning semaphores, or messages might be added to the logical flow described herein, for purposes of enhanced utility, accounting, performance measurement, or providing troubleshooting aids, etc. It is understood that all such variations are within the scope of the present disclosure.

Also, any logic or application described herein, including an electronic commerce system 115, a search application 118, a group request application 121, a network page build process 124, that comprises software or code can be embodied in any non-transitory computer-readable medium for use by or in connection with an instruction execution system such as, for example, a processor 503 in a computer system or other system. In this sense, the logic may comprise, for example, statements including instructions and declarations that can be fetched from the computer-readable medium and executed by the instruction execution system. In the context of the present disclosure, a “computer-readable medium” can be any medium that can contain, store, or maintain the logic or application described herein for use by or in connection with the instruction execution system. The computer-readable medium can comprise any one of many physical media such as, for example, magnetic, optical, or semiconductor media. More specific examples of a suitable computer-readable medium would include, but are not limited to, magnetic tapes, magnetic floppy diskettes, magnetic hard drives, memory cards, solid-state drives, USB flash drives, or optical discs.

Also, the computer-readable medium may be a random access memory (RAM) including, for example, static random access memory (SRAM) and dynamic random access memory (DRAM), or magnetic random access memory (MRAM). In addition, the computer-readable medium may be a read-only memory (ROM), a programmable read-only memory (PROM), an erasable programmable read-only memory (EPROM), an electrically erasable programmable read-only memory (EEPROM), or other type of memory device.

It should be emphasized that the above-described embodiments of the present disclosure are merely possible examples of implementations set forth for a clear understanding of the principles of the disclosure. Many variations and modifications may be made to the above-described embodiment(s) without departing substantially from the spirit and principles of the disclosure. All such modifications and variations are intended to be included herein within the scope of this disclosure and protected by the following claims.

Therefore, the following is claimed:

1. A non-transitory computer-readable medium embodying a program executable in a computing device, wherein, when executed, the program causes the computing device to at least:

identify a plurality of third party profiles associated with a corresponding plurality of third party users based at least in part on a percentage similarity to at least one profile associated with a user;

encode for display at least one first network page configured to generate a group request, the at least one first network page comprising a topic field to input a topic and a third party criteria selection mechanism to select a value of a percentage similarity to at least one of the plurality of third party profiles to respond to the group request;

receive from a user a selection of the value of the percentage similarity to the at least one of the plurality of third party profiles;

encode for display at least one second network page to facilitate an input of a plurality of suggestions from the at least one of the third party profiles; and

store the plurality of suggestions in association with a plurality of user accounts associated with the plurality of third party profiles.

2. The non-transitory computer-readable medium of claim **1**, wherein the plurality of suggestions rendered in the at least one second network page relate to a plurality of items offered for sale by an electronic commerce system.

3. The non-transitory computer-readable medium of claim **2**, wherein the plurality of suggestions provide advice in response to the group request.

4. A system comprising:

a physical data store configured to store profile data; and a computing device in communication with the physical data store, the computing device configured to at least:

identify a plurality of third party profiles associated with a plurality of third party accounts based at least in part on predefined criteria;

facilitate presentation of a topic field to input a topic and a third party criteria selection mechanism to select a subset of the plurality of third party profiles;

receive from a user a selection of a value of a percentage similarity to at least one profile associated with the user; and

identify the subset of the plurality of third party profiles based at least in part on the value of the percentage similarity.

5. The system of claim **4**, wherein the computing device is further configured to encode or display at least one first network page that includes the topic field and the third party criteria selection mechanism, wherein the at least one first network page is sent to a second computing device in use by the user and is configured to generate a group request.

6. The system of claim **5**, wherein the computing device is further configured to encode for display at least one second network page that obtains a plurality of suggestions from a plurality of third party users associated with the subset of the plurality of third party profiles selected in the group request.

7. The system of claim **5**, wherein the computing device is further configured to authenticate the user associated with a user account.

8. The system of claim **5**, wherein the at least one first network page further comprises a search field to input at least one search term, wherein the subset of the plurality of third party profiles is identified based at least in part on the at least one search term.

9. The system of claim **6**, wherein the plurality of suggestions are further stored in association with a user account of the user.

10. The system of claim **6**, wherein the plurality of suggestions are further stored in association with the plurality of third party accounts associated with the subset of the plurality of third party profiles.

11. The system of claim **6**, wherein the plurality of suggestions are related to at least one of a plurality of items sold by an electronic commerce system.

12. The system of claim **6**, wherein the plurality of suggestions provide feedback in response to the topic specified in the topic field.

13. A computer-implemented method comprising: rendering for display, in a first computing device, at least one first user interface comprising a topic field configured to input a topic, a search field configured to input a search term, and a third party criteria selection mechanism configured to select a plurality of third party users; receiving the topic as a first input in the first computing device;

receiving a user selection of a value of a percentage similarity to at least one profile associated with a user of the first computing device to identify a selection of the third party users based at least in part on the value of the percentage similarity; and sending the topic and the user selection of the value of the percentage similarity from the first computing device to a second computing device.

14. The computer-implemented method of claim **13**, further comprising rendering for display, in the first computing device, at least one second user interface presenting a plurality of suggestions from the third party users associated with a plurality of third party profiles.

15. The computer-implemented method of claim **13**, further comprising authenticating a user account associated with the user providing the topic.

16. The computer-implemented method of claim **14**, wherein the plurality of suggestions relate to at least one item sold through an electronic commerce system.

17. The computer-implemented method of claim **14**, wherein the plurality of suggestions are stored in association with a user account.

18. The computer-implemented method of claim **14**, wherein the plurality of suggestions are stored in association with a plurality of third party accounts.

19. The computer-implemented method of claim 14, wherein the plurality of suggestions comprise at least one of a plurality of images of clothing items.

20. The computer-implemented method of claim 14, wherein the plurality of suggestions comprise at least one item related to the topic. 5
