(57) **ABSTRACT**

An interactive television program guide system based on multiple user television equipment devices in a single household is provided. The system provides a user with an opportunity to adjust program guide settings with a given one of the interactive television program guides. The system coordinates the operation of the interactive television program guides so that the program guide settings that were adjusted with the given interactive television program guide are used by the other interactive television program guides. Program guide setting include features related to setting program reminders, profiles, program recording features, messaging features, favorites features, parental control features, program guide set up features (e.g., audio and video and language settings), etc. The operation of applications such as web browser applications, home shopping applications, home banking applications, game applications, etc. may also be coordinated.

INTERACTIVE TELEVISION PROGRAM GUIDE SYSTEM HAVING MULTIPLE DEVICES WITHIN A HOUSEHOLD

This application is a continuation of U.S. patent application Ser. No. 11/179,410, filed Jul. 11, 2005, which is continuation of U.S. patent application Ser. No. 09/356,161, filed Jul. 16, 1999 now abandoned, which claims the benefit of U.S. provisional patent application No. 60/093,292, filed Jul. 17, 1998.

BACKGROUND OF THE INVENTION

This invention relates to interactive television program guides, and more particularly, to techniques for providing interactive television program guide functionality on multiple devices within a household.

Cable, satellite, and broadcast television systems provide viewers with a large number of television channels. Viewers have traditionally consulted printed television program schedules to determine the programs being broadcast at a particular time. More recently, interactive electronic television program guides have been developed that allow television program information to be displayed on a viewer's television.

Interactive television program guides are typically implemented on set-top boxes. Such programs guides allow users to view television program listings in different display formats. For example, a user may instruct the program guide to display a grid of program listings organized in a channel-ordered or a time-ordered list. Users may also search or sort program listings by theme (e.g., movies, sports, etc.) or by title (i.e., alphabetically). A user may obtain additional information for a program by placing a highlight region on a desired program listing and pressing an "info" button.

Households with children are concerned with protecting children from the potentially objectionable adult content contained in the broad range of programs that are currently available. Some program guides allow users to block channels or programs using a parental control function. For example, a user may instruct the program guide to block access to channels that provide adult programs. A user must enter a password to regain access to such adult channels.

Another feature available on some program guides is the ability for the cable operator to send messages such as billing information to the user. A user may also have the ability to set reminders that will alert the user when a preselected program is about to begin or that will automatically tune the user's set-top box to the channel of the preselected program when the program is about to begin. A user may have the ability to establish a list of favorite channels. All of these program guide settings and features are specific to the user's set-top box.

Families often have multiple televisions and set-top boxes placed throughout the household. A family's household even may include multiple homes. Because there is no coordination between the program guides running on each of the various set-top boxes in the household, if a user adjusts the settings for a program guide on one set-top box, these settings are not communicated to the program guides on any of the other set-top boxes in the household. If a parent wants to restrict access to certain channels on all the televisions in the household, the parent must adjust the parental control settings on each set-top box individually. Reminders and favorite channel settings must similarly be set for each program guide separately if a user desires to have such settings be in effect throughout the household. Messages sent from the cable operator can only be sent to a particular set-top box. Some cable system subscriber management systems can allow a cable operator to manage all cable boxes within a home (i.e. manage billing for individual locations within a home). However, such systems do not allow user interaction with the cable operator.

It is therefore an object of the present invention to provide a program guide system that allows a user to adjust to the user settings of a plurality of program guides at different locations within a household from a single location.

SUMMARY OF THE INVENTION

These and other objects of the present invention are accomplished in accordance with the principles of the present invention by providing an interactive television program guide system for a household in which multiple interactive television program guides within the household are coordinated. In a typical system, various users in the household use various pieces of user television equipment (also called user television equipment devices). An interactive television program guide is implemented on each piece of user television equipment. Typical user television equipment may be a set-top box on which a program guide application and non-program-guide applications run, a videocassette recorder connected to the set-top box for recording television programs, and a television on which the program guide application may display various program guide display screens and the non-program-guide applications may display various non-program-guide display screens. Other suitable types of user television equipment may be based on personal computer televisions (PC/TVs) or advanced television receivers such as high-definition television (HDTV) receivers.

Each piece of user television equipment may be located in a different part of the home. For example, one piece of equipment may be located in the parents' bedroom. Another piece of equipment may be located in a child's bedroom. Additional pieces of equipment may be located in a family room, kitchen, living room, etc.

Typical program guide features that may be provided by the program guides of this invention implemented on the user television equipment include features related to setting program reminders, profiles, program recording features, messaging features, favorites features, parental control features, program guide set up features (e.g., video display settings, language settings, etc.), and other suitable program guide features. The system coordinates operation of the program guides so that, for example, a user may adjust his favorite channel settings on a program guide operating in the living room and those settings will be effective on the program guide operating in the master bedroom and may therefore be used by that program guide.

A parent may adjust parental control settings using the program guide in the parents' room and the system may apply those settings to all program guides in the household. Parents may use the parental control feature to control the viewing of their children even though the children may be viewing television using multiple user television equipment devices. For example, parents may establish parental controls to lock various programs and services from a master location and the system will apply these parental controls to the various pieces of user television equipment throughout the household. The ability to establish favorite channels, to set reminders, and to control other program guide settings at one location and to have those settings applied to multiple locations throughout the household may be used by both the parents and their children.

A user may adjust his favorite settings on a program guide in the family room and may direct the system to apply those settings to the program guides in the family room and the living room. A child may set reminders for certain programs using the program guide in the family room and may direct the system to apply those settings only to the program guide running in that child's bedroom. A user may select a program for recording using a program guide in the living room and may request that the videocassette recorder in the family room be used to record the selected program. A user may receive messages from a cable system operator and may direct the system to make certain types of those messages available to the program guide located in all rooms but the children's room. A user may adjust language or audio settings using one program guide and have those settings apply globally.

As these examples serve to illustrate, the settings for any suitable program guide features may be adjusted using the program guide at one location in a household and applied by the system to selected other program guides in the household.

The program guides may be linked using any suitable topologies and communication protocols. For example, the various pieces of user television equipment may be interconnected using a tree, bus or ring topology. One piece of user television equipment may be designated as a primary device and other pieces of user television equipment may be designated as secondary devices. The primary and secondary devices may be connected in a star arrangement. A remote server may be used to implement certain program guide features and the pieces of user television equipment in the home may act as clients.

If desired, non-program-guide applications may be implemented on the user television equipment. Such non-program-guide applications may include, for example, a web browser application, a home shopping application, a game application, an e-mail application, a chat application, a banking application, etc. These applications may be implemented on a set-top box within the user television equipment. The user may adjust the settings of such a non-program-guide application at one set-top box. The system coordinates the operation of the various set-top boxes so that the adjusted settings may be used by similar applications running on other set-top boxes in the household.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. **1** is a diagram of an interactive television program guide system in accordance with the present invention.

FIG. **2** is a flow chart of steps involved in adjusting user settings and applying those adjustments to desired locations in accordance with the present invention.

FIG. **3** is a diagram of a system in which multiple interactive television program guides are implemented in a star configuration accordance with the present invention.

FIG. **4***a* is a diagram of a system in which multiple interactive television program guides are implemented in a tree configuration in accordance with the present invention.

FIG. **4***b* is a diagram of a system in which multiple interactive television program guides are implemented in a ring configuration in accordance with the present invention.

FIG. **4***c* is a diagram of a system in which multiple interactive television program guides are implemented in a bus configuration in accordance with the present invention.

FIG. **5** is a diagram of another system in which multiple interactive television program guides are implemented in a client-server configuration in accordance with the present invention.

FIG. **6** is a diagram of a system in which multiple interactive television program guides are implemented in a client-server configuration and in which the set-top-box acts as the server in accordance with the present invention.

FIG. **7***a* is a diagram of a system similar to the system of FIG. **1** in which multiple interactive television program guides are implemented in a neighborhood node configuration in accordance with the present invention.

FIG. **7***b* is a diagram of a system similar to the system of FIG. **1** showing how servers may be located at network nodes in accordance with the present invention.

FIG. **7***c* is a diagram of a system similar to the system of FIG. **1** showing how homes may be connected by modem links in accordance with the present invention.

FIG. **7***d* is a diagram of a system similar to the system of FIG. **1** showing how homes may be connected via a server in accordance with the present invention.

FIG. **8** is a diagram of a system in which multiple interactive television program guides are implemented and in which each such guide uses a real-time communications device connected to the Internet in accordance with the present invention.

FIG. **9** is a diagram of a system in which multiple interactive television program guides are implemented with an occasional return path communications device in accordance with the present invention.

FIG. **10** is a diagram of illustrative user television equipment with an optional data input device in accordance with the present invention.

FIG. **11** is a depiction of an illustrative location selection screen in accordance with the present invention.

FIG. **12** is a depiction of an illustrative main menu screen in accordance with the present invention.

FIG. **13** is a depiction of another illustrative location selection screen in accordance with the present invention.

FIG. **14** is a flow chart showing steps involved in an illustrative approach for selecting a location for which to adjust settings in accordance with the present invention.

FIG. **15** is a depiction of an illustrative parental control password screen and an illustrative corresponding parental control access denied screen in accordance with the present invention.

FIG. **16** is a diagram of an illustrative parental control screen in accordance with the present invention.

FIG. **17** is a flow chart showing steps involved in an illustrative approach for applying parental controls in accordance with the present invention.

FIG. **18***a* is a depiction of an illustrative parental controls set channels screen in which selected channels are blocked in accordance with the present invention.

FIG. **18***b* is a depiction of an illustrative parental controls set channels screen in which selected channels are hidden in accordance with the present invention.

FIG. **19** is a depiction of an illustrative monitor viewing screen in accordance with the present invention.

FIG. **20** is a depiction of an illustrative browse screen in accordance with the present invention.

FIG. **21** is a depiction of an illustrative set reminder screen in accordance with the present invention.

FIG. **22** is a depiction of an illustrative select reminder screen in accordance with the present invention.

FIG. **23** is a flow chart showing steps involved in an illustrative approach for setting and selecting a reminder in accordance with the present invention.

FIG. **24** is a depiction of an illustrative favorite channels screen in accordance with the present invention.

FIG. **25** is a depiction of an illustrative set recording screen in accordance with the present invention.

FIG. **26** is a depiction of an illustrative pay-per-view movies screen in accordance with the present invention.

FIG. **27** is a depiction of an illustrative pay-per-view select start time screen in accordance with the present invention.

FIG. **28** is a depiction of an illustrative messages receiving screen in accordance with the present invention.

FIG. **29** is a depiction of an illustrative messages sending (user entered) screen in accordance with the present invention.

FIG. **30** is a depiction of an illustrative messages sending (pre-set) screen in accordance with the present invention.

FIG. **31** is a depiction of an illustrative setup screen in accordance with the present invention.

FIG. **32** is a depiction of an illustrative setup language screen in accordance with the present invention.

FIG. **33** is a depiction of an illustrative setup audio screen in accordance with the present invention.

FIG. **34** is a depiction of an illustrative Internet browser screen in accordance with the present invention.

FIG. **35** is a depiction of an illustrative shopping data entry screen in accordance with the present invention.

FIG. **36** is a depiction of an illustrative stock ticker data entry screen in accordance with the present invention.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

An illustrative program guide system **30** in accordance with the present invention is shown in FIG. **1**. Main facility **32** contains a program guide database **34** for storing program guide information such as television program guide program listings data, pay-per-view ordering information, television program promotional information, etc. Information from database **34** may be transmitted to multiple television distribution facilities such as television distribution facility **38** via communications links such as communications link **40**. Only one such television distribution facility **38** and one communications link **40** are shown in FIG. **1** to avoid over-complicating the drawings. Link **40** may be a satellite link, a telephone network link, a cable or fiber optic link, a microwave link, a combination of such links, or any other suitable communications path. If it is desired to transmit video signals (e.g., for advertising and promotional videos) over link **40** in addition to data signals, a relatively high bandwidth link such as a satellite link is generally preferable to a relatively low bandwidth link such as a telephone line.

Television distribution facility **38** is a facility for distributing television signals to users, such as a cable system headend, a broadcast distribution facility, or a satellite television distribution facility or the like.

The program guide information transmitted by main facility **32** to television distribution facility **38** includes television program listings data such as program times, channels, titles, descriptions, etc. Transmitted program guide information may also include pay program data such as pricing information for individual programs and subscription channels, time windows for ordering programs and channels, telephone numbers for placing orders that cannot be impulse ordered, etc. If desired, some of the program guide and advertising information may be provided using data sources at facilities other than main facility **32**. For example, data related to pay program order processing (e.g., billing data and the like) may be generated by an order processing and billing system that is separate from main facility **32** and separate from television distribution facility **38**. Similarly, advertising information may be generated by an advertising facility that is separate from main facility **32** and television distribution facility **38**.

A server **42** may be provided in television distribution facility **38** for handling data distribution tasks and for storing local information. If desired, server **42** may be used to implement a client-server based interactive television program guide system. In such a system, client functions may be performed at user television equipment **44**. Server **42** may be capable of handling text, graphics, and video.

Television distribution facility **38** distributes program guide and advertising information to the user television equipment **44** of multiple users via communications paths **46**. Program guide data and other information may be distributed over an out-of-band channel on paths **46** or using any other suitable distribution technique.

Each user has a receiver, which is typically a set-top box such as set-top box **48**, but which may be other suitable television equipment into which circuitry similar to set-top-box circuitry has been integrated. If desired, user television equipment **44** may be an advanced television receiver or a personal computer television (PC/TV). For purposes of illustration, the present invention will generally be described in connection with user television equipment based on a set-top box arrangement. Program guide data may be distributed to set-top boxes **48** periodically and stored or may be distributed continuously and handled "on the fly.", or by request. Television distribution facility **38** may poll set-top boxes **48** periodically for certain information (e.g., pay program account information or information regarding programs that have been purchased and viewed using locally-generated authorization techniques). Main facility **32** preferably contains a processor to handle information distribution tasks. Each set-top box **48** preferably contains a processor to handle tasks associated with implementing a program guide application on the set-top box **48**. Television distribution facility **38** may contain a processor for tasks associated with implementing server **42** and for handling tasks associated with the distribution of program guide and other information.

Each set-top box **48** is may connected to an optional videocassette recorder **50** or other suitable recording device (e.g., digital storage device) so that selected television programs may be recorded. Each videocassette recorder **50** may be connected to a television **52**. To record a program, set-top box **48** tunes to a particular channel and sends control signals to videocassette recorder **50** (e.g., using an infrared transmitter) that direct videocassette recorder **50** to start and stop recording at the appropriate times.

During use of the interactive television program guide implemented on set-top box **48**, television program listings may be displayed on television **52**. Each set-top box **48**, videocassette recorder **50**, and television **52** may be controlled by one or more remote controls **54** or any other suitable user input interface such as a wireless keyboard, mouse, trackball, dedicated set of buttons, etc.

Communications paths **46** preferably have sufficient bandwidth to allow television distribution facility **38** to distribute scheduled television programming, pay programming, advertising and other promotional videos, and other video information to set-top boxes **44** in addition to non-video program guide data. Multiple television and audio channels (analog, digital, or both analog and digital) may be provided to set-top boxes **48** via communications paths **46**. If desired, program listings and other information may be distributed by one or more distribution facilities that are similar to but separate from television distribution facility **38** using communications paths that are separate from communications paths **46**.

Certain functions such as pay program purchasing may require set-top boxes **48** to transmit data to television distribution facility **38** over communications paths **46**. If desired, such data may be transmitted over telephone lines or other separate communications paths. If functions such as these are provided using facilities separate from television distribution facility **38**, some of the communications involving set-top boxes **48** may be made directly with the separate facilities.

The present invention involves the distribution of user program guide settings to multiple program guide locations within a household. Such a household may contain multiple pieces of user television equipment. A program guide may be implemented on each piece of user television equipment. An illustrative process for distributing such settings is shown in FIG. **2**. At step **500**, a first program guide provides the user with an opportunity to adjust program guide settings (e.g., program guide settings for user profiles, favorites, parental controls, reminders, recording options, pay-per-view options, message options, or other setup functions). At step **510**, the system coordinates the operation of the multiple interactive television program guides so that the program guide settings that were adjusted with the first interactive television program guide are effective on a second interactive television program guide and may be used by that second interactive television program guide.

The steps of FIG. **2** are preferably performed using program guides as the program guides implemented on set-top boxes **48** of FIG. **1**. Certain program guide functions (particularly the display of graphics or videos) may involve the use of resources located at main facility **32** and television distribution facility **38** and other such facilities. If desired, some of the steps of FIG. **2** may be performed using an application running on set-top boxes **48** other than the interactive program guide. For clarity, the principles of the invention are described in the context of an arrangement in which the set-top-based steps of FIG. **2** are performed primarily using an interactive television program guide.

FIGS. **3**, **4***a*, **4***b*, **4***c*, **5**, and **6** show various illustrative topologies for configuring multiple program guides within a household.

FIG. **3** shows an illustrative arrangement for interconnecting various user television equipment devices in accordance with the present invention. Primary user television equipment **60** may be connected to secondary user television equipment **61**, secondary user television equipment **62**, and secondary user television equipment **63** via communication paths **64**. Communications paths **64** may be any suitable communications path for in-home network, such as twisted pair lines, Ethernet links, fiber optics, power lines, radio-frequency (RF) links, infrared (IR) and links other wireless links, firewire (IEEE 1394) paths, dedicated cables, etc. As shown, one or more pieces of secondary user television equipment may be connected to primary user television equipment **60** in a star configuration if desired. User television equipment devices are typically located in different rooms within home **65**. For example, primary user television equipment **60** may be placed in the parents' bedroom, secondary user television equipment **61** may be placed in the children's room, secondary user television equipment **62** may be placed in a living room, and secondary user television equipment **63** may be placed in a guest room. With such an arrangement, the parents' bedroom may be used as a master location to adjust user settings for the program guides on the user television equipment in the children's room and the other rooms.

FIG. **4***a* shows an illustrative tree configuration in which each piece of user television equipment is interconnected with another along a single path. User television equipment **66**, **67**, **68**, and **69** of FIG. **4** are connected to each of the others via communications paths **70**. Communications paths **70** may be any suitable communications path for in-home network, such as twisted pair lines, Ethernet links, fiber optics, power lines, radio-frequency (RF) links, infrared (IR) and links other wireless links, firewire (IEEE 1394) paths, dedicated cables, etc. Two or more pieces of user television equipment may be connected in this way. The equipment mentioned above may be placed in various rooms within home **65**. For example, user television equipment **66** may be placed in a parents' bedroom, user television equipment **67** may be placed in a children's room, user television equipment **68** may be placed in a living room, user television equipment **69** may be placed in a guest room. With the arrangement of FIG. **4***a*, each piece of user television equipment in home **65** may communicate with each other piece of user television equipment in home **65** over communications paths **70**. FIG. **4***a* shows the system connected in a tree topology. If desired, this level of interconnectivity may be achieved using communications paths that are arranged in a ring configuration (FIG. **4***b*), bus configuration (FIG. **4***c*) or other suitable topology. Any of these topologies may use the types of communications paths described in connection with the arrangement of FIG. **4***a*.

FIG. **5** shows an illustrative configuration based on a client-server architecture. Server **80** may be connected to user television equipment **81**, **82**, and **83** via communication paths **85**. Equipment **81**, **82**, and **83** and server **80** may be placed in various rooms within home **65**. For example, server **80** may be placed in a den, user television equipment **81** may be placed in a children's room, user television equipment may be placed in a living room, user television equipment **83** may be placed in a parents' room. Communication paths **85** may be any in-home network suitable to transmit video, audio and data, such as dedicated cable fiber optics, firewire links, RF links, etc. As, in the examples of FIGS. **4***a*, **4***b*, and **4***c*, different communications path arrangements such as buses, rings and the like, may be used to interconnect user television equipment based on a client-server architecture.

FIG. **6** shows an illustrative configuration based on a single set-top box. Set-top box **90** is connected to optional videocassette recorders **91** and televisions **94**, **96**, and **98** via communication paths **99**. Optional videocassette recorder **91** is in turn connected to television **92**. If desired, any combination of televisions with or without videocassette recorders and televisions may be connected in a similar manner. The set-top box, videocassette recorders and televisions of FIG. **6** may be placed in rooms within home **65**. For example, set top box **90**, videocassette recorder **91** and television **92** may be placed in a parent's bedroom, television **94** may be placed in a children's room, and television **96** may be placed in a living room, and television **98** may be placed in a guest room. Communication paths **99** may be any in-home network paths suitable for transmitting video, audio and data, such as, dedicated cable, fiber optics or firewire links.

FIGS. **7***a*, **7***b*, **7***c*, **8**, and **9** show illustrative configurations for the connection between the home and the television distribution facility. Only one user television equipment device is shown in the households in FIGS. **7***a*, **7***b*, **7***c*, **8**, and **9** to avoid over-complicating the drawings. However, each household **65**, **101**, **102**, **103**, **104**, **401**, and **402** in FIGS. **7***a*, **7***b*, **7***c*, **8**, and **9** may contain multiple pieces of user television equipment configured as shown in FIG. **3**, **4***a*, **4***b*, **4***c*, **5**, or **6**.

FIG. **7***a* shows an illustrative configuration in which multiple homes are handled by a common server. Server **105** may be located at central facility **100**. Central facility **100** may be a private home, a commercial building, a network node, or

other suitable structure that may be connected to a plurality of homes. In the example of FIG. **7***a*, server **105** is connected to user television equipment **106**, **107**, **108**, and **109** that is located in homes **101**, **102**, **103**, and **104**, respectively via communication paths **700**. When multiple user television equipment devices exist within a home as shown by devices **109***a* and **109***b*, each user television equipment device may communicate with the server **105** independently via communication paths **700**, alternatively only one device may communicate while the other communicates via a home network. In other words, in alternative arrangements, there are either **1**) multiple connections to an outside server and each user television equipment device communicates with the server independently with no need for an in-home network, or, 2) only one connection to an outside server and each user television device communicates with each other through an in-home network.

As shown in FIG. **7***b*, the capabilities of server **42** (FIG. **1**) may be provided using servers **56** located at network nodes **58**. Servers such as servers **56** may be used instead of server **42** or may be used in conjunction with a server **42** located at television distribution facility **38**.

Graphics information for messages, advertisements and the like may be downloaded periodically (e.g., once per day) to set-top boxes **48** of FIG. **1** and stored locally. The graphics information may be accessed locally when needed by the program guides implemented on set-top boxes **48**. Graphics information may also be provided in a continuously-looped arrangement on one or more digital channels on paths **46**. With such a continuously-looped arrangement, a map indicating the location of the latest graphics information may be downloaded periodically to set-top boxes **48** (e.g., once per day) or continuously. This allows the content on the digital channels to be updated. The program guides on set-top boxes **48** may use the map to locate desired graphics information on the digital channels. Another approach involves using a server such as server **42** or servers **56** (FIG. **7***b*) to provide the graphics information after a set-top box **48** and that server have negotiated to set up a download operation. A bitmap or other suitable set of graphics information may then be downloaded from the server to the set-top box. If desired, the server may download instructions informing the set-top box where the desired graphics information can be located on a particular digital channel. The graphics information can be updated periodically if the server that is responsible for downloading the instructions for informing the set-top box of the location of the graphics information is also updated periodically.

Text information for messages, advertisements and the like may be provided to set-top boxes **48** using the same paths that are used for distributing program guide data. For example, advertising data from database **36** of FIG. **1** may be provided to set-top boxes **48** using link **40**, television distribution facility **38**, and paths **46**. The text information may be stored locally in set-top boxes **48** and updated periodically (e.g., once per day).

Text information, graphics information, and videos for messages, advertisements and the like may also be distributed using a combination of these techniques or any other suitable technique.

As shown in FIG. **7***c*, when a household has more than one home, the user television equipment in each home may be connected by modem link or other suitable link for transferring data between homes. For example, user television equipment **403** may be connected to user television equipment **404** via link **405**. Link **405** may use internal or external modems, cable modems or other communications devices suitable for transmitting audio, video, and text data. In this manner, home **401** and home **402** may share program guide settings.

As shown in FIG. **7***d*, when a household has more than one home, the user television equipment in each home may be connected via an outside server. For example, user television equipment **413** may be connected to user television equipment **414** via server **410**. Communication paths **415** may use internal or external modems, cable modems or other communications devices suitable for transmitting audio, video, and text data. In this manner, home **411** and home **412** may share program guide settings.

FIG. **8** shows an illustrative configuration in which a server is connected to the home via the Internet. Set top boxes **122** are connected to the Internet **110** or other suitable data network in real time using real-time communications devices **121**. Videocassette recorders **123** may be connected between set-top boxes **122** and televisions **124**. Real-time communications devices **121** may be any devices suitable for maintaining a constant open connection with network **110**, such as internal or external modems, cable modem, or the like. The network used to connect homes to television distribution facility **38** may be any network suitable for distributing video and audio data such as the Internet. Network **110** is connected to television distribution facility **38** by communications link **115** and is connected to real-time communications device **121** by communications links **120**.

FIG. **9** shows an illustrative configuration in which user television equipment is linked to a server outside the home via an occasional return path. Set top box **132** is connected to occasional return path communications device **130** and videocassette recorder **134**. Videocassette recorder **134** may be connected to television **136**. Occasional return path communications device **130** may be any device suitable for connecting set-top box **132** to a server for the transfer of video and audio data, such as an internal or external modem, cable modem, or the like. Occasional return path communications device **130** server **42** which may or may not be connected to television distribution facility **38** using a communications path **131**. Communications path **131** may be, for example, a telephone link or other non-dedicated communications path suitable for providing an occasional return path to home **65** from server **42**.

FIG. **10** shows illustrative components for user television equipment **44** (FIG. **1**). In the arrangement of FIG. **10**, set top box **48** is connected to data input device **140**. Data input device **140** may be a keyboard, keypad, or any device suitable for inputting text (wired or wireless), audio or video. Videocassette recorder **50** is connected to set-top box **48** and television **52**. Remote control **54** is used to control the operation of set-top box **48**, videocassette recorder **50**, and television **52**.

Further aspects of the invention are described in detail below. For clarity, the principles of the invention described below are described in the context of the device configuration shown in FIG. **3** and the steps illustrated of FIG. **2**, except where noted. However, the principles of the present invention also apply to configurations such as those shown in FIGS. **4-9**. Also, the foregoing description is merely illustrative of the principles of this invention and various modifications can be made by those skilled in the art without departing from the scope and spirit of the invention.

In any of the above arrangements, an interactive television program guide on each user television equipment device may provide various features for displaying television program listings information for the user and for providing various program guide functions such as parental control, favorites, pay-per-view purchasing, etc. For example, if the user presses

the appropriate buttons on remote control **54**, the user may be presented with a time-ordered or channel-ordered grid or table of television program listings or other such programming information.

With one suitable approach, the user may select one of the user television equipment devices to be a master or primary device. Adjusting the program guide settings of the master device controls these settings for all other devices in the household. For example, with the arrangement of FIG. **3**, the user may set primary user television equipment **60** to be the master device. Primary user television equipment **60** may be located in the parents' bedroom. This allows the head of the household to control the program guide settings for all of the program guides in the household from a single location.

The system may provides the user with an opportunity to assign a master device, such as user television equipment **60**, that will coordinate its program guide settings with other devices such as secondary user television equipment **61**, **62**, and **63**. The system also provides the user with an opportunity to assign secondary devices.

One suitable way in which the system may allow the user to assign devices as primary (master) and secondaries is for at least one of the program guides (e.g., the program guide running on set-top box **60**) to provide an assign locations screen such as assign locations screen **160** of FIG. **11**. Screen **160** may be accessed, for example, by first accessing main screen **170** of FIG. **12** (by pressing, e.g., a suitable key on remote control **54**). After accessing screen **170**, the user can use remote control **54** to move highlight region **177** to the setup option **179** and select setup option **179** by pressing a select key, enter key, "OK" key, or other such key (sometimes referred to herein as simply an enter key) on remote control **54**.

Selecting setup option **179** directs the program guide to display a setup screen such as setup screen **310** of FIG. **31**. The user can select assign location option **316** on setup screen **310** by moving highlight region **312** and pressing the enter key. Selecting assign location option **316** directs the program guide to display assign locations screen **160** of FIG. **11**. The user can then move highlight region **162** to set B option **165**. Selecting option **165**, directs the program guide to provide the user with an opportunity to enter a name to assign to set B. For example, the user may use data input device **140** or remote control **54** to enter letters **164** associated with the selected name. The program guide may use such user-defined device names when the relationship between devices is set up. For example, the user may designate the "parents room" location as a master location and may designate the "children's room" location as a slave location.

The names of locations may be pre-set by a service provider and simply assigned by the user. Alternately the user (or an installation technician), may have the ability to assign locations from the home. The location name may be chosen from a list as above or typed in by the user (or an installation technician.)

In the alternative arrangement shown in FIG. **4**, each piece of user television equipment **66**, **67**, **68**, and **69** is a peer. The user can assign names to each such user television equipment device in much the same way that names may be assigned to the secondary devices in the FIG. **3** arrangement.

As shown in FIG. **14**, at step **1000**, the program guide may provide the user with an opportunity to select the devices or locations for which the user desires to adjust settings. Step **1000** may, for example, involve providing a screen such as select location screen **400** of FIG. **13**. At step **1001** of FIG. **14**, after the user has made a selection by moving highlight region **155** (FIG. **13**) to the desired device (e.g., parents' room option **154**) and pressed the enter key, the program guide sets the selected locations. The guide may also default to a particular location based on the type of setting that is changed. (e.g., if a setting for the recording of a program is changed, the guide may default to location with a videocassette recorder.) The guide may default to any combination of locations based on the type of setting that is changed. There are also "other factors" that may be used by the guide to determine at which location the settings will be effective. These include: the current location of the user making the adjustment, whether a location to be adjusted is currently being used, the state of other settings, etc. At step **1002**, the program guide may return to a menu (e.g., menu **170** in FIG. **12**).

The program guide may allow a unique number to be assigned to a user so that he or she is able to access his or her program guide settings at a location outside the home. For example, a user may visit a neighbors home to housesit while the neighbor is out of town. This user has the ability to log on to the program guide at the neighbors home and access his or her personal program guide settings.

The program guide may allow the user to set parental controls to prevent children from viewing potentially inappropriate material. At step **1010** of FIG. **17**, for example, the program guide may provide the user with an opportunity to access main screen **170** of FIG. **12**. On Main screen **170**, the user may use remote control **54** to move highlight region **177** to the parental control option **176** and select that option by pressing the enter key.

At step **1011** of FIG. **17**, after the user has entered a preselected password **211** (FIG. **15**) on enter password screen **210** of FIG. **15**, the program guide checks the password. If the wrong password was provided at step **1013**, then the user is shown invalid password screen **212** of FIG. **15** and is denied access to parental control screen **190** of FIG. **16** at step **1014** of FIG. **17**, and may be returned to main menu screen **170** of FIG. **12**. If the user has provided a valid password at step **1012**, the program guide provides various options at step **1015**. At step **1015**, the user can access parental control screen **190** of FIG. **16** and may use remote control **54** to navigate between options such as set channels option **191**, set maximum rating option **193**, and monitor viewing option **195**. The user may navigate to set channels screen **200** of FIG. **18***a* by selecting set channels option **191** at step **1016** of FIG. **17** by moving the highlight region **192** and pressing select.

If the user selects set channels option **191** at step **1016**, at step **1020** the program guide provides the user with an opportunity to set which channels are to be blocked. The user may block specific channels using remote control **54** to scroll through and select from channel options **201**, **202**, **203**, and **204** of FIG. **18***a*. For example, the user may move highlight region **207** to channel option **201** (which may be an adult channel). The user can then toggle between blocking and not blocking the channel by pressing the enter key on remote control **54**.

In screen **200** of FIG. **18***a*, a blocked channel is represented by an X. The user can choose to apply the parental controls selected in screen **200** of FIG. **18***a* to all locations by selecting apply to all option **205**, choose to apply to the current location by selecting current location option **209**, or can choose to apply the controls to a specific location or locations by selecting the select locations option **206** from the option provided by the program guide, at step **1024** of FIG. **17**. The guide may apply the settings to a default location or to a location determined by other factors as described above.

FIG. **18***b* shows an illustrative parental controls set channels screen **208** that may be used when it is desired to hide controlled channels rather than merely blocking them. When

the user chooses to hide the channels, the blocked channels do not appear on any of the program listings display screens provided by the program guide.

The user may also navigate to a set maximum ratings screen by choosing set maximum rating option **193** of FIG. **16**, at step **1017** of FIG. **17**, by moving a highlight region and pressing select. At step **1021** of FIG. **17**, the user may then set a maximum rating allowed for viewing in a manner similar to the set channels option. For example, the user may move a highlight region to a set maximum rating option (which may be TV-MA), then the user can enter his selected maximum using remote control **54**. Next, the user can choose to apply the adjustments to all locations by selecting an apply to all option or may opt to apply the adjustments to a specific location or locations by selecting a select locations option from the options provided by the program guide, at step **1024** of FIG. **17**. The guide may apply the settings to a default location or to a location determined by other factors as described above.

The user may navigate to monitor viewing screen **230** of FIG. **19** by choosing the monitor viewing option **195** of FIG. **16** (step **1019** of FIG. **17**) by moving highlight region **192** to the monitor viewing option **195** and pressing enter.

At step **1023** of FIG. **17**, the program guide at the user's location may then, in one alternative, provide the user with monitor viewing screen **230**, which shows the channel that each location is currently viewing or an overlay such as a banner or small information box that shows the channels that the other locations are viewing, but that also allows the user to continue watching programming at the user's location. The program guide at the user's location may poll the program guides at other locations within the household to determine whether anyone is currently viewing television and to which channels they are tuned. The monitor viewing screen may also allow the viewing of video, audio, or still images associated with the channel being viewed at another location. For example, the video of the remote location may be shown in a small box on the screen while the current channel's video is in the background.

The guide may allow the user to change the channel of a remote location. For example, a user in the parents' room may notice that the television in the children's room is tuned to a program the child should not be watching. The user may change the channel without physically-going into the child's room.

The guide may also allow a level of privacy to be set for a location so that location cannot be monitored. For example, if guests are visiting a household the monitor feature may be disallowed in the parents' room.

Other parental control features that may be distributed to remote locations within a household include: blocking channels by title, blocking channels by time, blocking channels by content (language, nudity, etc.), blocking the ability to use a feature (e.g., reminders), blocking the ability to set and clear pin numbers, ability to temporarily disable parental controls (e.g., disabling parental controls while the child is at school), and the ability to set pin numbers for individual locations or for the entire household. Additionally, the guide may have the ability to use multiple sets of parental control settings profiles. For example, the user may create a late night profile of parental controls and day time profile of parental controls. The guide then allows the user to designate which parental controls profile to use and when to use it.

Another feature that may be provided by the program guide is a reminders feature, which may be accessed by selecting reminders option **178** from the menu of main screen **170** of FIG. **12**. The reminders feature allows the user to set a reminder for a television program that the user wishes to watch at a later time. Just before the television program for which a reminder has been set is to be broadcast, a reminder message is displayed on the user's television screen. Reminders may also be provided that direct the program guide to automatically tune the user's set-top box to the program specified in the reminder. Reminders may also provide the user with an on-screen reminder when a selected program begins and may allow the user to manually tune to the selected channel.

A family reminders option may be provided that operates similarly to the reminders functions described above and which allows reminders to be set for a family, which may be accessed by selecting family reminders option **184** from the menu of main screen **170** of FIG. **12**. For example, in FIG. **7***a* server **105** at central facility **100** may store many family reminder settings (or other settings) for individual homes. The program guides in a particular home or household may also provide the ability to adjust favorites settings, parental control settings, reminder settings and the like. These settings may be named and associated with a viewing location, an entire home, or a group of homes.

A series reminder option may be provided that allows users to set reminders for program series. Series reminders are described in Knudson et al. U.S. patent application Ser. No. 09/330,792, filed Jun. 11, 1999, which is hereby incorporated by reference herein in its entirety.

An illustrative example of using the reminders feature is as follows. If a user at one of the program guide locations within the household presses an appropriate button (e.g., the enter button) after having used a browse feature (i.e., a pop-up program listing display **256**) to navigate to a program listing **257** for "Holiday Entertaining" as shown in screen **255** of FIG. **20**, the program guide at that location may present the user with set reminder screen **350** of FIG. **21**. Set reminder screen **350** allows the user to choose to set a reminder for the selected program **352** (Holiday Entertaining) by selecting yes option **354** with highlight region **356** shown at step **1030** of FIG. **23**. If the user selects no option **358**, set reminder screen **350** is canceled. If set reminder screen **350** is not canceled, the user select the program guide locations (i.e., the locations of the various user television equipment devices within the household) to which the adjustments are to be applied by selecting apply to all option **205**, current location option **209**, or by selecting the select locations option **206** (step **1031**, FIG. **23**) and interacting with various sub-menus listing the available locations from which to choose. Set reminder screen **350** and other such screens in the program guide may use either a full-screen or partial-screen display format. After the user selects the program guide locations to which the reminders are to be applied, the program guide at the user's location communicates with the program guides at the user-selected locations. During this communication process, the program guide at the user's location directs the other program guides to set reminders for display at their locations just before the scheduled broadcast time of the program. If desired, the program guide at the user's location can communicate with the program guides at the selected locations using other suitable techniques. For example, the program guide at the user's location may issue instructions to the program guides at the selected locations just before the scheduled broadcast time of the program for which the reminder was set that causes those program guides to display a reminder message at that time. These approaches are merely illustrative. Any other suitable approach for communicating the reminders settings or any other program guide settings from the

program guide at the user's location to the other program guides may be used if desired.

A short time before the scheduled broadcast time of the program for which a reminder has been set, the program guide at each selected location may display a reminder display region **361** on the television screen **360** at that location (Step **1032**; FIG. **23**), as shown in FIG. **22**. Reminder display region **361** may be displayed as a partial screen overlay over the currently displayed television channel (e.g., channel **9**). In the example of FIG. **22**, two reminders were set for the 10:00 AM time slot. As a result, reminder display region **361** contains program listings for both selected programs. A user at any of the program guide locations in which the reminder is displayed may automatically tune to one of the selected programs by moving highlight region **362** from hide reminders option **363** to program listing **364** or program listing **365**. When the user at that location presses the select button, the set-top box **48** at that location tunes to the channel of the selected program (step **1033**, FIG. **23**). If the user selects hide reminders option **363**, reminder display region **361** is hidden from view. Additionally, reminders may be set to automatically tune to a particular channel without accessing a reminder display region. For example, a parent would have the ability to insure that the children's television automatically tunes to an educational program by setting a reminder for that program.

In addition to the opportunity to set reminders, the user may be provided the opportunity to create profiles to customize the viewing experience, which may be accessed by selecting profiles option **183** from the menu of main screen **170** of FIG. **12**. For example, if desired, the program guides may allow each user to establish a profile of settings and other criteria as described, for example, in commonly-assigned Ellis et al. U.S. patent application Ser. No. 09/034,934, filed Mar. 4, 1998, which is hereby incorporated by reference herein in its entirety. With such an approach, users may establish profiles of preferences such as their favorite channels, preferred genres of programming (sports, comedy, etc.), favorite actors, desired or required ratings, etc. In accordance with the present invention, one of the program guides may provide the user with an opportunity to apply this profile to all locations or to apply such settings to a specific program guide location or locations. The guide may apply the profile to a default location or to a location determined by other factors as described above.

The user may also be provided the opportunity to set favorite channels. The program guide at the user's location may display a menu such as the menu of main screen **170** of FIG. **12**. The user may then use remote control **54** to navigate to the favorites option **175** using remote control **54** and pressing the enter button.

Once the user chooses favorites option **175**, the program guide at the user's location may present the user with a favorite channels screen such as favorite channels screen **250** of FIG. **24**. The user may move highlight region **207** to a channel such as channel option **251** of screen **250** (which may be a local news channel), channel option **252** of screen **250**, channel option **253** of screen **250**, or channel option **254** of screen **250**. The user can then toggle between selecting and not selecting that channel by pressing the enter key on remote control **54**. In the example of FIG. **24**, a favorite channel is represented by an X. Next, the user can choose to apply the selected favorites settings to various other program guide locations by selecting apply to all option **205**, apply to select locations option **206**, or apply to current location **209**. If the user chooses the apply to select locations option **206**, the program guide at the user's location provides the user with menu screens from which to select the desired locations to which the favorites settings are to be applied. The desired locations may be set by default or other factors as described above. A parent may want to prevent children from even seeing the titles of objectionable programming.

The user may be provided with an opportunity to select programs for recording at a later time. For example, if the user presses an appropriate button (e.g., a "record" button) after having used a browse feature to navigate to a program listing for "Holiday Entertaining" as shown in FIG. **20**, the program guide at the user's location may present the user with a set recording screen such as set recording screen **270** of FIG. **25**. Set recording screen **270** allows the user to set a selected program **274** (Holiday Entertaining) for recording by the program guide by selecting yes option **272** with highlight region **271**. If the user selects no option **273**, set recording screen **270** is canceled.

If a household has only one videocassette recorder **50**, there will only be one location that will make all recordings, regardless of which location the recordings are set from. If there are multiple videocassette recorders, the user may be presented with select location screen **400** of FIG. **13** after selecting the yes option **272**, that provides the user with an opportunity to select the location that will make the recording. If desired multiple locations may be selected. The guide may choose which VCR is used based on which VCR is busy or based on other factors.

At the scheduled broadcast time of the program to be recorded, the program guide at each selected location causes videocassette recorder **50** to begin recording. After the scheduled completion of the broadcast of the recorded program, each program guide causes its videocassette recorder **50** to stop recording. The guides may cause videocassette recorders **50** to stop and start recording by sending an IR signal to the videocassette recorders IR input or by, any other suitable method for transmitting a signal to a videocassette recorder.

A series recording option may also be provided that allows users to record program series. Series recording is described in the above-mentioned Knudson et al. U.S. patent application Ser. No. 09/330,792, filed Jun. 11, 1999.

Another example of a program guide feature that benefits from coordination between multiple program guide devices in a household is pay-per-view ordering.

The user may be provided with an opportunity to order pay-per-view programming with a program guide display screen such as main screen **170** of FIG. **12**. The user may use remote control **54** to select the pay-per-view by time option **181**.

The user may select a program to order from a screen such as pay-per-view screen **290** of FIG. **26** using remote control **54** to navigate through program options. For example, the user may move highlight region **291** to program listing **292** (which may be for the movie "Volcano" scheduled to be aired at 10:00 PM). The user may then select the program by pressing the enter button on remote control **54**. Pay-per-view ordering screens such as pay-per-view ordering screen **370** of FIG. **27** may be used to allow the user to view information on channel **371** on which the program is scheduled to be broadcast, rating **377**, price **378** (shown illustratively as involving a surcharge for availability at additional locations within the household), and various available broadcast times **373**, **374**, and **376**. A cancel option **372** allows the user to cancel pay-per-view ordering. The user may select cancel option **372** or a given broadcast time **373**, **374**, or **376** by placing highlight region **375** on top of the desired option and pressing enter. The user may choose to make the selected program available to various locations within the household by selecting the select

locations option **206**. Alternatively, the guide may make the program available to a default location or to a location determined by other factors as described above.

The program guide system may support a messages option, which may be accessed by selecting messages option **174** from the menu of main screen **170** of FIG. **12**. Messages may be sent from the service provider at television distribution facility **38** (FIG. **1**) and may relate, e.g., to billing matters, general concerns, service issues, etc. Messages may be sent to the main facility or other locations by the Internet or electronic messages or other suitable means. Messages may appear on the television screen of television **52** when received. The appearance may, for example, be in a text box at the bottom of the screen. The user may be provided a list of messages that may be viewed and choose one to view. An indicator may also appear showing that unread messages exist. A messages receiving screen such as messages receiving screen **300** of FIG. **28** may be provided that allows, the user to navigate through a table relating various locations with various types of messaging. For example, the user may move highlight region **301** to the option relating to messages of the billing type for the children's room location. By hitting the enter key the user may toggle between turning such messages on and off. If, in this example, messages are turned on, the children's room would receive billing messages. If messages are turned off, the children's room would not receive billing messages.

A user may have the ability to send text, audio, graphics or video messages between locations. On Messages sending screen **340** of FIG. **29**, the user may use data input device **140** (FIG. **10**) to type a text message in the message entry section **343**. Alternately the user may enter audio messages through, for example, using a microphone as a data input device or video with a camera device. The user can select which location to send the message to by moving highlight region **341** to location option **342** (which may be the children's room). For example, a parent in the downstairs master bedroom may send a message telling the child in the upstairs bedroom to come down for dinner or to do their homework. [[If desired,]] Messages sending screen **379** of FIG. **30** may provide the user with an opportunity to select from pre-existing text messages **380**. Pre-existing messages **380** may have been previously stored by a user or pre-set by the manufacturer. Messages may be transmitted between program guides at different locations within the household using any suitable communications technique such as e-mail protocols or any method described in connection with the above discussion of various topologies.

The program guide system may also provide the user with an opportunity to set device control options. For example, the user may access main screen **170** of FIG. **12**, and use remote control **54** to choose the setup option **179** by using the remote control **54** to scroll to the setup option **179** and pressing the enter button. The user can then select audio option **312** on setup screen **310** of FIG. **31** by moving highlight region **313** and pressing the enter button. Next, on the setup audio screen **330** of FIG. **33**, the user may move highlight region **332** to set volume option **331**. The user may use remote control **54** to adjust the volume upwards or downwards. For example, parents may wish to turn down the volume on the kids television. The user may choose to apply the adjustments made on screen **330** to all locations by selecting apply to all option **205**, to the current location by selecting apply to current location option **209**, or may choose to apply adjustments to a specific location or locations by selecting the select locations option **206**. Alternatively, the guide may apply the settings to a default location or to a location determined by other factors as described above.

Other device options, such as, video option **314** and closed-captioning (CC) option **315** may be set from screen **310** of FIG. **31**. After the user has chosen a location to which the settings may be applied, the user may name the location by selecting name location option **317**.

Another program guide option that may be coordinated within the household is an option for selecting languages. From setup screen **310** of FIG. **31**, the user may also select language option **311** by moving highlight region **313** and pressing the enter button. On setup language screen **320** of FIG. **32** or other such screen, the user may move highlight region **321** to select a language (which may be German). The user may use remote control **54** to select the chosen language. The user may choose to apply the adjustments to all locations by selecting apply to all option **205**, choose to apply adjustments to a specific location or locations by selecting the select locations option **206**, or choose to apply to the current location by selecting current location option **209**. Alternatively, the guide may apply the settings to a default location or to a location determined by other factors as described above. The selected language may be used by the program guide when displaying program guide screens that contain text or audio, as described in Ellis et al. U.S. patent application Ser. No. 09/354,602, filed concurrently herewith, which is hereby incorporated by reference herein in its entirety.

Data files may be used to transmit program guide settings. When a particular program guide retrieves program guide settings adjustments for the user, this data may be transmitted to the central facility or to another program guide via the return path in a two-way cable link, via modem link, or via any other suitable communications path. The settings may be stored at a server or on any on of the program guides in a household. For example, in the configuration of FIG. **3**, program guide settings adjustments collected at secondary user television equipment **61**, may be stored at primary user television equipment **60**. Similarly, set top box **90** of FIG. **6** may store program guide settings for televisions **92**, **94**, **96**, and **98**. In the configuration of FIGS. **4***a*, **4***b*, and **4***c*, program guide settings adjustments collected at user television equipment **66** may be stored at any one of user television equipment devices **66**, **67**, **68**, or **69**. In the configuration of FIGS. **7***a* and **7***b*, program guide settings that are shared such as family reminders may be stored on any one of servers **56**, server **105**, or server **42**. Program guide settings may be transmitted periodically or when a data transfer is requested by a a particular piece of user television equipment or the central facility. Certain communications protocols may be particularly suitable for certain topologies of user television equipment devices. For example, if the user television equipment devices are arranged in a ring topology, a token ring communications protocol may be used to interconnect the program guides. A bus protocol may be used for a bus topology, etc.

An advantage of using an in home network is sharing of data among devices within the home. For example, a listing may be stored on only one device, freeing space for other settings to be stored on other devices.

Messaging information may be transmitted to or from the central facility via the return path in a two-way cable link, via modem link, or via any other suitable communications path. The type of message may determine where the message is stored. Messages sent by the central facility may generally be stored at the central facility. Messages generated by a user may be stored at the user television equipment that stores the user's other program guide settings.

The discussion thus far has focused on implementing the invention with an interactive television program guide. The invention may also be applied to non-program-guide applications. These non-program-guide applications run on user television equipment such as a set-top box. For example, an Internet browser may be run on a set-top box connected to a television. Internet application settings can be coordinated among televisions and/or set-top boxes within a household in the same way that program guide settings are coordinated among program guides in the house.

One non-program-guide application that may be implemented in accordance with the present invention is an Internet browser. An Internet browser may have settings such as bookmarks, parental control settings, and general preferences that control how the browser functions. As shown in FIG. **34**, a browser application screen **700**, may have a bookmark option **705**. After adding a bookmark, the system allows the bookmark and other settings to be effective on other locations in the household. For example, a user may select bookmark option **705** and add a bookmark (i.e., a record of the address of the current web site that can be used to access the site). Through a network, in accordance with the present invention, the application can make the bookmark effective on other locations in the household. Accordingly, the user can choose to apply settings adjustments to all locations by selecting an apply to all option or may opt to apply the adjustments to a specific location or locations by selecting a select locations option from the options provided by the program guide. The guide may apply the settings to a default location or to a location determined by other factors as described above.

Another application that may be implemented in accordance with the present invention is an shopping application. A shopping application may have settings such as a default shipping address, and credit card number. As shown in FIG. **35**, a shopping application screen **730**, has settings such as a shipping address **720**, and credit card number **725**. After adding a shipping and credit card information, the system allows the shipping address, credit card number and other settings to be effective on other locations in the household. For example, a user can add a shipping address. Through a network, in accordance with the present invention, the application can make the shipping address effective on other locations in the household. Accordingly, the user can choose to apply settings adjustments to all locations by selecting an apply to all option or may opt to apply the adjustments to a specific location or locations by selecting a select locations option from the options provided by the program guide. The guide may apply the settings to a default location or to a location determined by other factors as described above.

Another non-program-guide application that may be implemented on user television equipment and coordinated with other such applications in accordance with the present invention is a stock ticker. A stock ticker may have settings such as settings indicating the top 10 stocks in which the user is interested. As shown in FIG. **36**, a stock ticker settings screen **710** has a ticker symbol **712** and a top 10 stocks option **715**. For example, a user may add a top stock. Then, through a network, in accordance with the present invention, the application can make the top 10 stock settings effective on other locations in the household. Accordingly, the user can choose to apply the adjustments to all locations by selecting an apply to all option or may opt to apply the adjustments to a specific location or locations by selecting a select locations option from the options provided by the program guide. The guide may apply the settings to a default location or to a location determined by other factors as described above.

A chat application may be implemented on user television equipment such as a set top box. Chat applications are services that allow users to exchange chat messages with other users in real time. A chat application may be implemented as a stand-alone chat application or as part of another application such as a program guide application. A user may adjust settings associated with a chat application such as the size of a chat window or whether to filter potentially offensive messages. Chat applications that may be implemented on user television equipment are described in McKissick et al. U.S. patent application Ser. No. 09/356,270, filed concurrently herewith, which is hereby incorporated by reference herein in its entirety. After the user adjusts chat settings, the user can choose to apply the chat settings adjustments to all locations by selecting an apply to all option or may opt to apply the adjustments to a specific location or locations by selecting a select locations option. Settings may be coordinated between the chat applications using options provided by the chat application. The chat application may apply the settings to a default location or to a location determined by other factors as described above.

If desired, the settings of an e-mail application running on different user television equipment devices in the household may be coordinated. When the user adjusts the e-mail settings associated with one user television equipment device, the system coordinates the operation of the other e-mail applications so that the adjusted e-mail settings may be used by the other e-mail applications.

The foregoing is merely illustrative of the principles of this invention and various modifications can be made by those skilled in the art without departing from the scope and spirit of the invention.

What is claimed is:

1. A method for viewing a program, the method comprising:

generating a display of a video associated with a program at a first equipment device coupled to a second equipment device, wherein the video generated for display at the first equipment device is transmitted concurrently to a plurality of equipment devices while the video is generated for display at the first equipment device;

transmitting, independently of receiving user input at the first equipment device, an identification of the program, from the first equipment device to the second equipment device, while the video associated with the program is generated for display at the first equipment device, wherein the second equipment device is configured to:

receive the identification of the program from the first equipment device;

receive, independently of the first equipment device, a user input that requests to view the identified program using the second equipment device; and

generate a display of the video associated with the program in response to receiving the user input.

2. The method of claim **1**, wherein the identification identifies the first equipment device.

3. The method of claim **1**, further comprising:

receiving an instruction from the second equipment device to change the video associated with the program generated for display by the first equipment device; and

changing the video associated with the program generated for display by the first equipment device in response to receiving the instruction.

4. The method of claim **3**, wherein changing further comprises tuning the first equipment device away from the channel of the program.

5. The method of claim 3, wherein changing further comprises turning off the first equipment device.

6. The method of claim 1, further comprising:

determining whether the second equipment device is authorized to monitor the first equipment device; and

generating a display of the video associated with the program in response to determining that the second equipment device is authorized to monitor the first equipment device.

7. The method of claim 6, further comprising:

receiving authorization information from the second equipment device;

verifying the authorization information; and

generating a display of the video associated with the program in response to verifying the authorization information.

8. The method of claim 7, wherein the authorization information comprises a password.

9. The method of claim 1, wherein a first interactive program guide implemented on the first equipment device transmits the identification of the program to a second interactive program guide implemented on the second equipment device.

10. The method of claim 1 further comprising:

receiving, at the first equipment device, a communication from the second equipment device requesting identification of the program generated for display on the first equipment device, and

transmitting the identification of the program, from the first equipment device to the second equipment device, in response to receiving the communication.

11. The method of claim 1, wherein the second equipment device generates a display of the identification of the program received from the first equipment device.

12. The method of claim 1, wherein an interactive program guide implemented on the second equipment device generates a display of the received identification as an overlay over another program currently being viewed using the second equipment device.

13. A method for identifying a program generated for display on another equipment device, the method comprising:

generating a display of a video associated with a program at a first equipment device coupled to a second equipment device, wherein the video generated for display at the first equipment device is transmitted concurrently to a plurality of equipment devices while the video is generated for display at the first equipment device, wherein the second equipment device is configured to:

receive, independently of the first equipment device, a user input that requests to identify the program corresponding to the video generated for display at the first equipment device;

cause the first equipment device to transmit, independently of receiving user input at the first equipment device, while the video associated with the program is generated for display at the first equipment device, identification information for the program corresponding to the video generated for display at the first equipment device to the second equipment device; and

generate a display of the identification information for the program corresponding to the video generated for display at the first equipment device on the second equipment device in response to receiving the identification information.

14. The method of claim 13, wherein the second equipment device is further configured to generate the display of identification information by generating a display of at least one of the channel, title, and rating of the video associated with the program generated for display.

15. The method of claim 13, further comprising:

receiving an instruction from the second equipment device to change the video associated with the program generated for display by the first equipment device; and

changing the video associated with the program generated for display by the first equipment device in response to receiving the instruction.

16. The method of claim 15, wherein changing further comprises tuning the first equipment device away from the channel of the program.

17. The method of claim 15, wherein changing further comprises turning off the first equipment device.

18. The method of claim 13, further comprising:

determining whether the second equipment device is authorized to monitor the first equipment device,

wherein the display of the identification information is generated in response to determining that the second equipment device is authorized to monitor the first equipment device.

19. The method of claim 18, further comprising:

receiving authorization information from the second equipment device; and

verifying the authorization information, wherein the display of the identification information is generated in response to verifying the authorization information.

20. The method of claim 19, wherein the authorization information comprises a password.

21. A system for viewing a program, the system comprising:

a first equipment device configured to:

generate, at the first equipment device, a display of a video associated with a program, wherein the first equipment device is coupled to a second equipment device, wherein the video generated for display at the first equipment device is transmitted concurrently to a plurality of equipment devices while the video is generated for display at the first equipment device; and

transmit, independently of receiving user input at the first equipment device, an identification of the program to the second equipment device while the video associated with the program is generated for display at the first equipment device, wherein the second equipment device is configured to:

receive, independently of the first equipment device, a user input that requests to view the identified program on the second equipment device; and

generate a display of the video associated with the program in response to receiving the user input.

22. The system of claim 21, wherein the second equipment device is further configured to provide an indication that the first equipment device is generating a display of the video associated with the program.

23. The system of claim 22, wherein the indication identifies the first equipment device.

24. The system of claim 21, wherein the first equipment device is further configured to:

receive an instruction from the second equipment device to change the video associated with the program generated for display by the first equipment device; and

change the video associated with the program generated for display by the first equipment device in response to receiving the instruction.

25. The system of claim 24, wherein the second equipment device is further configured to instruct a tuner to tune the first equipment device away from the channel of the program.

26. The system of claim 24, wherein the second equipment device is further configured to turn off the first equipment device.

27. The system of claim 21, wherein the first equipment device is further configured to:

determine whether the second equipment device is authorized to monitor the first equipment device; and

authorize the second equipment device to generate a display of the video associated with the program in response to determining that the second equipment device is authorized to monitor the first equipment device.

28. The system of claim 27, wherein the first equipment device is further configured to:

receive authorization information from the second equipment device;

verify the authorization information; and

authorize the second equipment device to generate a display of the video associated with the program in response to verifying the authorization information.

29. The system of claim 28, wherein the authorization information comprises a password.

30. The system of claim 21, wherein a first interactive program guide implemented on the first equipment device transmits the identification of the program to a second interactive program guide implemented on the second equipment device.

31. The system of claim 21, wherein the first equipment device is further configured to:

receive a communication from the second equipment device requesting identification of the program generated for display on the first equipment device, and

transmit the identification of the program in response to receiving the communication.

32. The system of claim 21, wherein the second equipment device is further configured to generate a display of the identification of the program received from the first equipment device.

33. The system of claim 21, wherein an interactive program guide implemented on the second equipment device generates a display of the received identification as an overlay over another program currently being viewed using the second equipment device.

34. A system for identifying a program generated for display on another equipment device, the system comprising:

a first equipment device configured to:

generate a display of a video associated with a program, wherein the first equipment device is coupled to a second equipment device, wherein the video generated for display at the first equipment device is transmitted concurrently to a plurality of equipment devices while the video is generated for display at the first equipment device;

receive a request to identify the program corresponding to the video generated for display at the first equipment device from the second equipment device, wherein the second equipment device receives a user input that requests to identify the program independently of the first equipment device; and

responsive to receiving the request to identify the program from the second equipment device, transmit, independently of receiving user input at the first equipment device, to the second equipment device, while the video associated with the program is generated for display at the first equipment device, identification information for the program corresponding to the video generated for display at the first equipment device, wherein the second equipment device is configured to generate a display of the identification information for the program corresponding to the video generated for display at the first equipment device in response to receiving the identification information.

35. The system of claim 34, wherein the identification information further comprises at least one of the channel, title, and rating of the video associated with the program generated for display.

36. The system of claim 34, wherein the first equipment device is further configured to:

receive an instruction from the second equipment device to change the video associated with the program generated for display by the first equipment device; and

change the video associated with the program generated for display by the first equipment device in response to receiving the instruction.

37. The system of claim 36, wherein the second equipment device is further configured to instruct a tuner to tune the first equipment device away from the channel of the program.

38. The system of claim 36, wherein the second equipment device is further configured to turn off the first equipment device.

39. The system of claim 34, wherein:

the first equipment device is further configured to determine whether the second equipment device is authorized to monitor the first equipment device; and

the second equipment device is further configured to generate the display of the identification information in response to the first equipment device determining that the second equipment device is authorized to monitor the first equipment device.

40. The system of claim 39, wherein:

the first equipment device is further configured to:

receive authorization information from the second equipment device; and

verify the authorization information; and

the second equipment device is further configured to generate the display of the identification information in response to the first equipment device verifying the authorization information.

41. The system of claim 40, wherein the authorization information comprises a password.

42. A method for viewing a program, the method comprising:

generating a display of a video associated with a program at a first equipment device coupled to a second equipment device;

transmitting, independently of receiving user input at the first equipment device, an identification of the program, from the first equipment device to the second equipment device, while the video associated with the program is generated for display at the first equipment device, wherein the second equipment device is configured to:

receive the identification of the program from the first equipment device;

receive, independently of the first equipment device, a user input that requests to view the identified program using the second equipment device; and

generate a display of the video associated with the program in response to receiving the user input, wherein the first equipment device is located in a home, and wherein the identification of the program is received by the second equipment device at a remote location not in the home.

43. A system for viewing a program, the system comprising:

a first equipment device configured to:

generate, at the first equipment device, a display of a video associated with a program, wherein the first equipment device is coupled to a second equipment device; and

transmit, independently of receiving user input at the first equipment device, an identification of the program to the second equipment device while the video associated with the program is generated for display at the first equipment device; wherein the second equipment device is configured to:

receive, independently of the first equipment device, a user input that requests to view the identified program on the second equipment device; and

generate a display of the video associated with the program in response to receiving the user input, wherein the first equipment device is located in a home, and wherein the identification of the program is received by the second equipment device at a remote location not in the home.

44. A method for identifying a program generated for display on another equipment device, the method comprising:

generating a display of a video associated with a program at a first equipment device coupled to a second equipment device, wherein the second equipment device is configured to:

receive, independently of the first equipment device, a user input that requests to identify the program corresponding to the video generated for display at the first equipment device;

receive from the first equipment device, independently of receiving user input at the first equipment device, while the video associated with the program is generated for display at the first equipment device, identification information for the program corresponding to the video generated for display at the first equipment device with the second equipment device; and

generate a display of the identification information for the program corresponding to the video generated for display at the first equipment device on the second equipment device in response to receiving the identification information, wherein the first equipment device is located in a home, and wherein the identification is transmitted responsive to the first equipment device receiving a request to transmit the identification from a remote location not in the home.

45. A system for identifying a program generated for display on another equipment device, the system comprising:

a first equipment device configured to:

generate a display of a video associated with a program, wherein the first equipment device is coupled to a second equipment device;

receive a request to identify the program corresponding to the video generated for display at the first equipment device from the second equipment device, wherein the second equipment device receives a user input that requests to identify the program independently of the first equipment device; and

transmit, independently of receiving user input at the first equipment device, to the second equipment device, while the video associated with the program is generated for display at the first equipment device, identification information for the program corresponding to the video generated for display at the first equipment device, wherein the second equipment device is configured to generate a display of the identification information for the program corresponding to the video generated for display at the first equipment device in response to receiving the identification information, wherein the first equipment device is located in a home, and wherein the identification is transmitted responsive to the first equipment device receiving a request to transmit the identification from a remote location not in the home.

46. A method comprising:

generating, at a first equipment device, a display of a video associated with a program, wherein the first equipment device is coupled to a second equipment device, wherein the video generated for display at the first equipment device is transmitted concurrently to a plurality of equipment devices while the video is generated for display at the first equipment device;

receiving, at the first equipment device from a second equipment device, a request to identify the program corresponding to the video generated for display at the first equipment device, wherein the second equipment device receives a user input that requests to identify the program independently of the first equipment device; and

responsive to receiving the request to identify the program from the second equipment device, transmitting to the second equipment device, independently of receiving user input at the first equipment device, while the video associated with the program is generated for display at the first equipment device, identification information for the program corresponding to the video generated for display at the first equipment device, wherein the second equipment device is configured to generate a display of the identification information for the program corresponding to the video generated for display at the first equipment device in response to receiving the identification information.
