ACCESSORIES AND JEWELRY**

CROSS-REFERENCE TO RELATED
APPLICATIONS

This application claims priority under 35 U.S.C. §119(e) from Provisional Patent Application Ser. No. 61/720,248, filed on Oct. 30, 2012 and Provisional Patent Application Ser. No. 61/745,453, filed on Dec. 21, 2012, the contents of both of which are incorporated herein by reference.

BACKGROUND

In the past 15 years, the mobile telephone industry has grown by leaps and bounds. The market demand for mobile phone accessories such as faceplates, cases, chargers, and Bluetooth® headsets has also proliferated rapidly.

Since the explosion of Apple's iPhone® and its contribution to the phenomenon of app culture, companies large and small are trying to produce devices that facilitate and maximize the use and functionality for consumers and their smartphones. For example, one company has recently introduced a "Smartwatch" that connects to a smartphone and can display Twitter feeds, Facebook updates, SMS, among other things pulled from a smartphone. Other companies have produced devices that measure the energy you exert on a daily basis and send it to a smartphone, while also telling the time. Other devices may track user's daily activity and send the information to a smartphone application. Other devices that can play music and display text, the weather and other information from a phone have also been introduced.

These smart watches primarily serve as a complement to smartphones; for example, they display information such as incoming calls and can control smartphone applications. As a result, the growth of the smartphone market directly influences growth of the smart watch market. The smartphone installed base hence serves as the total available market for smart watches.

However, many of these fitness and health focused accessories are single purpose. Further, even though watch-like devices have attempted to bridge the mobile phone and consumer's informational needs but they are more or less "geek-like" gadgets. Therefore style-conscious consumers, particularly females, do not take advantages of these unfashionable looking smart watches, Bluetooth headsets, etc.

Similarly, in the past decade, Bluetooth headsets have transformed to more than just transmitting voice conversation. In addition to advancing digital signal processing and sound quality, many brands have also attempted to increase battery life, form factor, and design of its wireless headsets. Some headsets come with a mini display (usually one or two liner) integrated for displaying caller ID, SMS, phonebook, song title, etc.

It is also true that most fashion houses and jewelry makers do not have the technical know-how to efficiently integrate their fashion jewelry with digital accessories. If they try to do it at all, they must outsource or partner with engineering service firms and/or Original Equipment Manufacturers (OEMs) to produce such a combination. Thus, none has been able to integrate Bluetooth headsets and wireless communication devices with jewelry and fashion accessories consumers enjoy wearing. It is believed that (1) the capability and technologies to miniaturize electronic and circuitry is pos-

2

sible today but keeping sufficient battery life increases the physical size of device proportionally and (2) other than the battery, the earbud and related components take up most of the real estate of the headset casing and industrial design.

5 Nonetheless, it is a fact that most women and style conscious consumers do not like and want to wear today's Bluetooth headsets and wireless communications devices in the market today are appealing to primarily to geeks, gadget-lovers, and/or fitness fanatics.

10 Further, these smart watches and headsets are all individually engineered from scratch. This negatively impacts their cost and limits expansion of a full 'line' of accessories unless new devices are built in similar boxy form factors.

15 What may be needed are ways to hide the earbud or listening device so a wireless headset can seamlessly integrate with fashion accessories and jewelry. Furthermore, devices for wireless terminals may need to be integrated and incorporated in jewelry and fashion accessory design, so consumer's daily digital communication needs is infused with such devices and part of their fashion.

BRIEF SUMMARY

25 The embodiments described herein may relate to an easily interchangeable, versatile platform to enable the design and incorporation of digital communication functionality in fashion accessories & jewelry, without the need to reinvent the wheel with each new design or develop extensive in-house technical know-how by fashion accessory and jewelry designers. For example, embodiments of the present application may include an interchangeable, versatile electronics package or platform compatible with the design and incorporation of wireless digital communication functionality in a wide variety of fashion accessories and jewelry. This might allow fashion accessory and jewelry designers to not be required to constantly re-design their form-factors or possess extensive technical know-how to participate in the next wave of the wearable mobile communication market.

30 Additionally, some embodiments may include coupling the device platform with an add-on accessory to transform the combined units into a fully functional wireless terminal device, where users can access and control the interlinked wireless telephone. In some embodiments where other wireless interface/connection (e.g., Wi-Fi, cellular, etc.) is present, a wireless terminal device can be a fully standalone functional apparatus with the capability of transmitting data to and from the 'cloud' (web based) services via the wireless network.

35 Further, embodiments may also include methods, systems, and apparatuses for incorporating wireless communication into fashion accessories and jewelry allows functional interchangeable wireless headsets and wireless communication devices to be integrated with designer fashioned pendants, necklace earrings, bracelets, rings, key chains & tags, hand-bag decoration chains & tags, tie clips, cufflinks, belt, etc.

40 For example, the an embodiment may provide a retractable earbud mechanism where earbud and related components can be hidden or stored for aesthetic purpose in addition to provide greater freedom and flexibility for designers to design. Furthermore, multiple mechanisms for retracting earbud are described to accommodate and incorporate with an endless combination of design, form factors, and sizes of fashion pendants, earrings, bracelets, and many other fashion accessories and jewelry.

45 Another embodiment may provide a battery powering/charging system. Additional rechargeable battery or batteries can be integrated with fashion accessories and jewelry, where

it already comprises a built-in rechargeable battery. In one example, additional rechargeable battery can be housed in the bracelets, bangles, necklaces, necklets, earring elements, key chain and bag decoration charm tags, belt, tie, etc. To achieve a robust and seamless battery charging system, a common removable connector(s) is provided in the present application.

In another example, users can wear a fashion pendant with wireless headset integrated, by plugging it to the connector that is removably attached to the necklace with built-in rechargeable battery. In turn, wireless headset will automatically be charged from the necklace's rechargeable battery. Pendant headset can easily and quickly detach from connector for use. Additional batteries can also be integrated with one or more pendants separately, but can be connected for charging through similar connectors. Similarly, batteries can be distributed in one or multiple elements of necklace, earrings, keychain tags, etc.

In some embodiments, necklaces with the built-in rechargeable battery can integrate with one or two wired headsets that can be used for voice communication or access to audio content on mobile phone/devices when coupled to pendant wireless headset through connector.

Bracelets, rings, earrings, keychain tags, and bag decoration charm tags can house rechargeable battery or batteries with integrated wireless headset. Battery or batteries for earrings, finger rings, key chain tags, and bag decoration tags may utilize and/or charge from external battery sources that are integrated with the accessory/jewelry, through either a removably attached connector or hardwired.

In another example, a tie clip with built-in wireless headset can be charged when it is clipped to a fashion tie, with a thin, flexible rechargeable battery integrated. The same tie clip can be charged when clipped anywhere on the shirt pocket where a thin, flexible rechargeable battery is built-in. Cufflinks with integrated wireless headset can be charged when it is coupled on a cuff of the shirt, where a thin, flexible rechargeable battery is incorporated inside the cuff.

Still another example, a removable wireless headset can be designed as part a belt buckle, and it is charged when docked (attached) from the rechargeable battery or batteries that are integrated inside the belt panel.

Charging may take place when electrical contacts of both the battery source and wireless headset come in contact, be it through removable connectors, hardwired, clip, or in combination. It should be understood more than one type of electrical contacts and connectors can be: plug & pull, magnetize, threaded structure, slider, ball bearing, etc. are described in the present application.

In accordance with some embodiments of the present application, methods, systems, and apparatuses can also provide wireless devices (such as wireless terminals that communicate with a mobile telephone or other computing devices) integrate with fashion accessories and jewelry. For example, a removable, portable wireless terminal with display screen can be integrated with fashion pendants, key chain tags, handbag decoration tags, belt buckle, bracelets, etc. Fashion accessories and jewelry (e.g., bracelets, bag decoration tags, belt buckles, etc.) can be designed with additional or larger displays so users can have a larger viewing real estate when they are coupled with a wireless terminal.

It may be understood, wireless terminals can be fully-functional wireless communication devices with the capability of today's smartphones. Furthermore, in addition to fashion accessories and jewelry (e.g., bracelets, pendants, etc.), wireless devices described herein can be used with companion devices with various display sizes. In one example, phone

companion and tablet companion consist of a multi-touch display with built-in rechargeable battery, while some embodiments may comprise storage or just temporary memory (e.g., RAM) and/or removable memory card such as a micro-SD, even though wireless devices have the capability to be coupled with external storage or other needed add-on external peripherals for extra performance and/or functionalities. Companion devices such as desktop monitor and television can also include storage and/or removable memory card with or without multi-touch and/or motion gesture control capability integrated.

Add-on peripherals can be connected to wireless devices in anyway user desired.

Methods, systems, and apparatuses of the present application may provide a powering/charging system where wireless device prioritizes, sets rules, and sends instructions to and from add-on peripherals (e.g., companion devices, additional battery, external storage, special camera, etc.) will instruct how. Batteries, external or internal (built-in with companion devices and fashion accessories & jewelry) will be charged according to rules and instructions set by wireless devices and/or user preference. Similarly, wireless headsets and wireless terminals that are integrated with fashion accessories and jewelry also share the methods of this power and charging system.

Consumers can maximize their investment by leveraging the 'same' interchangeable, adaptive wireless headset, wireless terminal, or wireless communication device for different fashion accessories and jewelry. In one example, the 'same' interchangeable headset or device that is integrated with the pendant can be used on a bracelet or handbag decoration tag. Because of the versatile of wireless device in accordance with the present application, the 'same' wireless device can also be integrated and used with companion devices described above in addition to fashion accessories and jewelry. Hence, methods, systems, and apparatuses of the present application may allow users to seamlessly and easily transform the 'same' wireless headset and wireless device into another device or fashion accessories/jewelry.

Furthermore, with methods, systems, and apparatuses in accordance with the present application, providing retractable mechanisms of earbud and a battery powering & charging system, advantageously, consumer electronics makers as well as fashion accessories & jewelry brands can easily and quickly integrate wireless headset, terminal, and communication devices to fashion accessories and jewelry (e.g., pendants, bracelets, earrings, tie clips, belts, key chain tags, etc.) in this robust platform.

According to an aspect of the present application, a wearable communication device including a bracelet including an integrated first power source, and a telecommunications device including a transceiver configured to allow wireless communication, wherein the telecommunications device is configured to couple and decouple with the bracelet, and wherein the telecommunications device is configured receive power from the first power source when coupled with the bracelet is provided.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1A illustrates shows a high level block diagram of a wireless fashion accessory **100** in accordance with an embodiment.

FIG. 1B illustrates a diagram of connection relationships of fashion accessories, in accordance with an embodiment.

FIGS. 2A, 2B, and 2C illustrate front, side and back view, respectively, of a fashion accessory in accordance with an embodiment.

FIG. 2D illustrates a perspective view of a fashion pendant accessory system 200 in accordance with an embodiment.

FIGS. 3A-3G illustrate a variety of connectors in accordance with some embodiments.

FIG. 3H illustrates an embodiment of an electrical contact on a connector.

FIG. 3I illustrates an embodiment of an inbuilt-battery necklace.

FIG. 3J illustrates examples of where connector receptacles may be housed in some embodiments.

FIG. 3K illustrates another embodiment 355, of the connector receptacle 230.

FIG. 3L illustrates several embodiments of male & female connectors.

FIGS. 4A-4D illustrates different embodiments of earphones.

FIG. 5A-5D illustrates various retractable earphone systems in a cross-sectional view in accordance with embodiments.

FIG. 6A illustrates a wired earbud-style headphone integrated with a fashioned necklace.

FIG. 6B illustrates another embodiment of the wired earbud-style headphones.

FIGS. 7A and 7B illustrate a digital fashion necklace & pendant system in accordance with two embodiments.

FIGS. 8A and 8B illustrate a system used as earrings in accordance with embodiments of the present application.

FIG. 9A-9C illustrates three slightly different embodiments of digital fashion finger ring system having wireless headsets integrated with the ring portion.

FIG. 10A illustrates a fashion bag decoration charm tag system 1000 in accordance with an embodiment that can be incorporated in a handbag or purse decoration charms.

FIG. 10B illustrates a keychain system in accordance with an embodiment.

FIGS. 11A-11C illustrates several different embodiments of devices according to the present application.

FIG. 12A illustrates a system of a digital fashion bracelet in accordance with one embodiment.

FIG. 12B illustrates an embodiment of a pair of wireless headsets coupling together and integrated with a device shown in FIG. 1A.

FIG. 12C illustrates another embodiment of a digital fashion bracelet in accordance to the present application.

FIG. 12D illustrates an example embodiment similar to FIG. 12A but with a bangle form factor.

FIG. 13A illustrates a fashion tie clip system in accordance with an embodiment.

FIG. 13B illustrates another embodiment of a fashion tie clip system.

FIG. 13C illustrates a tie clip or similar designed accessories clipped to a shirt pocket with a battery inside the pocket.

FIG. 14 illustrates a fashion cufflink system in accordance with one embodiment.

FIGS. 15A and 15B illustrate a digital fashion belt system 1500 in accordance with an embodiment.

FIG. 16A illustrates a high level block diagram of an enhanced wireless device.

FIG. 16B illustrates various views (perspective, front, back, and side views) the wireless device of FIG. 16A.

FIG. 17A illustrates the wireless device of FIGS. 16A and 16B worn by a user.

FIG. 17B illustrates a fashioned digital bracelet with a display screen on its surface, in accordance with one embodiment.

FIG. 17C illustrates the wireless device of FIGS. 16A and 16B incorporated with the fashioned digital bracelet of FIG. 17B.

FIG. 17D illustrates the wireless device of FIGS. 16A and 16B with adaptive connectors such as those with mechanism shown on FIG. 3K and incorporated with the digital bracelet of FIG. 17B.

FIG. 18A illustrates various ways the unique wireless device of FIGS. 16A and 16B can be used with companion devices in accordance with an embodiment.

FIGS. 18B and 18C illustrate electrical signals and currents of the wireless device of FIGS. 16A and 16B and add-on peripherals.

FIG. 19A-C illustrates a charging system in accordance with one embodiment.

FIG. 20A illustrates various shapes of internal batteries.

FIGS. 20B-20D illustrates different configurations of internal batteries incorporated into necklace designs.

FIG. 21A illustrates a flow diagram of device and add-on behaviors when they are coupled.

FIG. 21B illustrates a flow chart of powering & charging systems.

FIG. 22 illustrates a user interface system in accordance with an embodiment.

FIG. 23A shows a high level electronics block diagram of a device platform in accordance with one embodiment.

FIG. 23B illustrates a high level block diagram of an add-on accessory (companion fashion accessory).

FIG. 24 illustrates various views of the device platform of FIG. 23A.

FIG. 25A illustrates several embodiments of systems incorporating the device platform of FIG. 23A.

FIG. 25B illustrates a device platform similar to the device platform of FIG. 23A, which can be employed with smaller fashion accessories.

FIG. 26 illustrates a simplified flow chart of the functional operation of the device platform when coupled with an add-on accessory in accordance with an embodiment.

FIGS. 27A and 27B illustrate link relationships between a wireless terminal device, a wireless headset, and a wireless telephone.

FIGS. 28A-30 illustrates various alternative designs and embodiments of in a bracelet/bangle form factor.

DETAILED DESCRIPTION

To assist in the following description, a number of terms used herein will be defined.

Add-on accessory: an add-on accessory is a companion fashion accessory, usually with rechargeable battery integrated while some may or may not have a display. Certain embodiments may include more than one display and/or wireless ear set. Add-on accessory is an interchangeable terminology with “companion accessory”, “fashion accessory”, and “digital accessory”. It can any form factor, size, design style whereas it can be a pendant, bracelet, bangle, necklet, keychain tag, handbag decoration tag, etc.

Communication link: a signal or signals sent to and from one apparatus to another. It can be wirelessly or through physical connector of electrical contacts.

Connector: A set of electrical contacts for transmitting data, power and other electric signals from Device Platform to Add-on Accessory. Such transmission may be from one apparatus to another or from one component to another, etc.

Device platform: An apparatus that is capable of computing and displaying information and graphics, playing video and audio content, etc. to add-on accessory's screen and loud speakers when coupled with an add-on accessory. It may also comprise an accelerometer and other sensors. Generally, it is consists of similar components and circuitry (e.g., processor, memory, etc.) as today's smartphone, smart watch, terminal device, etc. It may be integrated with open-source OS and software such as Google's Android or proprietary software. "Device platform" can be also referred to as "electronics package" and "electronics platform."

Electronics package: also may be referred "Electronics platform" or "Device platform".

Flexible strap: A strap made with silicone, polymer, rubber-like or other materials that provide flexibility characteristics to enable the device platform to bend up or down or any direction to form a compatible curvature when coupled with the desired add-on accessory. As an example, the strap could be similar to an electronic 'ribbon cable' with embedded conductive pathways or traces can be included in which electrical energy can travel from one module or segment of the electronics package to any other module mounted on, or connected to, the strap.

Module: a self-contained, possibly oblong or rectangular, multi-functional package of various electronic components including power sources and conditioners which are mounted on the above referenced 'Flexible strap'. The individual modules (of which four are shown, as an example, to illustrate one of their form-factors on the accompanying Figures) can be mixed and matched depending upon the purpose and functionality of the device platform as well as a particular piece of designer jewelry such as a bangle or bracelet which might vary from a wireless ear-set or key chain. "Module", "Segment", and "Section" are interchangeable terms and are the same herein.

Smart watch: Generally it is a terminal device that receives data from interlinked smartphone. Primarily serve as complementary to smartphones to display information such incoming calls and to control smartphone applications. Data such as emails, social network updates, alerts, news, etc. can be pushed from interlinked smart device to smart watch.

Wearable: In the technology and wireless world, wearable is generally referred to an apparatus is having advanced circuitry, wireless connectivity and independent processing capability and being worn by users for an extended period of time, with the user experience significantly enhanced as a result.

Wireless ear set: A headset (typically only consisting of one earbud but could also comprise dual earbuds) that can receive and transmit voice and/or data wireless to and from a communication device such as a mobile telephone where users can listen and talk to one another in a group phone conversation.

Wireless terminal device: An apparatus with similar capabilities of a computer or "dumb" terminal where data can be transmitted to and from it to another computer or device and process or re-direct user or network commands to various components of the device. Generally user interface is provided for users to interact and control certain applications or functionality of the interlinked computer, device, local network, or carrier network.

With reference to FIGS. 1A-22, embodiments of the present application may be described. Examples are illustrated in the accompanying drawings. While the application will be described in conjunction with preferred embodiments, it will be understood that it is not intended to limit the application to only the described embodiments or visual represen-

tations. To the contrary, it is intended to cover alternatives, modifications, and equivalents as may be included within the spirit and scope of the application.

FIG. 1A shows a high level block diagram of a wireless fashion accessory **100** in accordance with an embodiment where it transmits data to and from mobile phone **150** or other computing devices with wireless communication interfaces **124**. For a fashion accessory without a display screen (or sufficient real estate screen space for displaying 10-20 characters, up to a maximum of 1 or 2 short sentences, such as caller ID, phone number, calendar alert, email subject line, song title, etc.) will generally be referred to "wireless headsets" hereafter. If a fashion accessory comprises a larger display (e.g., at least 1"×1" or 1"×3") sufficient to show minimal graphics and/or content, it will generally be referred to as "wireless terminal device". "Wireless headset" and "Wireless terminal device" may be used interchangeable—in such a case, it will generally be referred to as "device" or "fashion accessory."

Unlike any existing Bluetooth devices in the market, the wireless device **100** described in accordance with the present application may include a push-to-talk button **110** or a touch sensor **116** to empower users to activate the speech command functionality through the built-in speech processor **112**. Touch sensor (single point or multi touch) **116** allows users to control the headset without a traditional button. Furthermore, wireless headset **100** in accordance with an embodiment may include an accelerometer **118**, and proximity or other sensors **116** in addition to a vibration motor **120** and display screen **122**, in addition to all the required electronic components for a functional Bluetooth headsets, known in prior arts. Display **122** may be a touch or non-touch LCD, OLED, or flexible e-paper in some embodiments, while other embodiments may comprises a combination of these display technologies (e.g., part OLED and part e-paper) in accordance with the present application.

In addition to Bluetooth, fashion accessory may also consist of other wireless interfaces **124** such as Near Field Communication (NFC) and Wide Area Local Network IEEE 802.11 standards (e.g., Wi-Fi).

In some embodiments, fashion accessory **100** may be transmitting and receiving data **152**, to and from other fashioned digital accessories **100** such as bracelets, key chain tags, belt buckles, etc. which will be exemplified on the next figure diagram.

FIG. 1B shows a diagram of connection relationships of fashion accessories **100** in accordance with the present application. Any wireless telephone or wireless computing device **150**, so long it comprises the same wireless standards (e.g., Bluetooth) as the wireless fashion accessories **162**, **164**, **166**, **168**, **170** is compatible with the wireless fashion accessories.

As shown on this diagram, in accordance with the present application, mobile phone **150** can transmit to and from accessory with headset **162** such as a fashion pendants, bracelets, or earrings, to name a few, with built-in retractable earphones. Concurrently, while this accessory **162** is in operation (via connections a & b) with mobile phone **150**, this accessory **162** can also communicate with another accessory without headsets **164** or just the headset **166** via connections a & b.

Communications between accessories can be direct or through mobile phone **150** as a hub. For example, mobile phone may be used to communicate with accessory without headset **164** (e.g., bangle or keychain tag, etc.), in turn, this specific accessory **164** may be used to communicate with an accessory with headset **162** (e.g., earrings or pendant with

headset built-in, etc.) where first accessory **164** serves an informational display while second accessory **162** may function as a listening device.

In another configuration, while mobile phone **150** is in operation with fashion accessory without headset **164** such as a pendant, bag decoration tag, or bracelet, simultaneously mobile phone **150**, during the same operation, can also communicate with headsets that are built-in to fashion earrings **162** or a third party Bluetooth headset **166**. Similarly, while mobile phone **150** is communicating with accessory with display but without headset **168** or accessory with display and headset **170**, headset **166** can also be used in conjunction—communicating directly with mobile phone **150** or directly with connected accessory.

FIGS. **2A**, **2B**, and **2C** show front, side and back view, respectively, of the fashion accessory **202** in accordance with an embodiment, show the respective views of the connector **204**. In this particular embodiment, the fashion accessory **202** is a wireless headset **100** (e.g., Bluetooth headset) with retractable earphone **220**. In addition to the necessary components of today's functional Bluetooth headset, this embodiment is also equipped with a voice recognition chipset, and a touch sensor with the appropriate firmware. Electrical connector **204** is used to hang the pendant-like fashion accessory **202** to battery-integrated necklace **240**.

FIG. **2A** illustrates the front view of the device **202**, without a display in this specific embodiment, whereas connector **204** is detached to device **202**.

FIG. **2B** shows a side view of the device **202**. In one embodiment, connector **204** comprises a concave cavity **212** with one or more electrical contacts **214** along the concave wall **216** and an attached shaft **206**. At the end of the shaft **206** contains reciprocal electric contacts **208** to the contacts **214** for connections to and from the contacts of the connector receptacle **230** housed inside the device **202**. Part of the device **202**, a retractable earphone **220** consists of a gel-like earbud **222**, a neck **224**, and wheel **226**. A spring is integrated in the wheel **226** as a flip mechanism. Thus the earphone **220** can spring out from the device **202** with a press of the release button **228**. A sensor can be built in the connector receptacle housing **230** or the earphone flip mechanism for auto answering an incoming phone call when the male connector **204** is disconnected from the connector receptacle **230**, or when the release button **228** is triggered prior to answering an incoming phone call.

Similarly, the user can disconnect an active phone call by pushing the earphone **220** back into the storage cavity **232** built-in the device **202** which shown on FIG. **2C**. To end a call, user can also simply plug the device **202** back to the connector **204** where male contacts **208** and contacts in connector receptacle **230** are mated.

In addition to the pendant-like device **202**, it should be understood that this answering and disconnecting call operation also can be employed to all jewelry and fashion accessories described hereafter.

FIG. **2C** shows the back view of the device **202**, in accordance with the present application. In one embodiment, an ON/OFF switch **234** for enabling or disabling the battery recharging from necklace's battery source **240** to device **202**. An optional device release latch **236** is also included for securing the device **202** to the connector **204**.

Device **202** allows a user to communicate with other users through a mobile telephone device **150** or Voice-over-IP enabled device, without the need to speak directly into or hear sound directly from mobile phone **150** or any other wireless communication device.

FIG. **2D** shows a perspective view of the fashion pendant accessory system **200** in accordance with an embodiment. The system **200** includes a wireless pendant-like device **202** and electrical connectors **204** which can be electrically coupled to the battery-integrated necklace **240**, for transmitting electric currents, data, or both to the device **202** for powering and/or sending data to device **202**, and/or recharging internal battery of the device **202** by connecting male connector **204** to connector receptacle **230** of the device **202**. Connector **204** consists of a shaft **206** which include one or more contact points **208** to transmit power, data, or both.

In this particular embodiment, the device **202** includes a display screen **212**, which can display information and content transmitted **152** to and from the mobile phone **150** or other computing devices with wireless communications (e.g., Bluetooth, Wi-Fi, etc.). The screen **212** can be a touch e-paper (e.g., e-ink), OLED display, or other display technology or combination (e.g., part e-paper, part OLED).

Users may have an option to conveniently use the loud speaker phone **238** in lieu of the integrated retractable earphone **220** for listen to audio or phone conversation with the ability to talk directly into its built-in microphone **242** without having to decouple the device **202** from the connector **204** that is attached to the necklace **240**, while it's worn on user's neck.

Hereafter, "device" **202** may refer to all embodiments regardless of form factor, finishes, color, and built materials—and with or without a display. For instance, device **202** can be shaped like a hexagon, circular, or silhouette of Mickey Mouse® or Hello Kitty®. Device **202** can be a wireless headset **100** (e.g., Bluetooth hands-free earphone) or a wireless terminal device **100** or any form of fashion jewelry & accessories where data can be transmitted **152** to and from a mobile telephone **150** or other wireless computing devices with complementary wireless standards (e.g., Bluetooth or Wi-Fi).

FIG. **3A-3G** show a variety of connectors **300** which can be any shape, size, and form factors, design, with different electrical contacts in accordance with some embodiments while in other embodiments, connectors (male plug and connector receptacle) may be eliminated in lieu of integration of wireless connector interfaces. A latch for keeping fashion accessory **100** (e.g., the pendant device **202**) and connector **300** in a locked position could be integrated to any or all of the connectors described hereafter in accordance with the present application.

FIG. **3A** shows a drawing of a connector **300** with a circular head **302** and the shaft facing sideways **304** while FIG. **3B** illustrates an embodiment comprised of a triangular head with shaft **304** facing straight with electrical contacts **308** at the bottom but both of these connector heads **304** consist of an opening **306** with electrical contacts integrated to the concaved wall of the opening slot **306**.

FIG. **3C** is an embodiment where connector **301** consists of an open-looped head **303** rather than close-looped **302** as exhibited on FIG. **3A**, but also comprises a shaft **304** and contacts **308**. Electrical contacts are also housed on the concaved wall of the cavity **307**. Advantageously, opened connector head **303** offers flexibility for add-ons if users desire.

For instance, users could string battery-integrated earrings **305** with built-in wireless headset **309** by hooking the opened connector **301** to one another; therefore this allows more battery source should users desire it. This configuration may also benefit fashioned wireless pendants, handbag decoration tags, key chain tags, and the like.

FIGS. **3D** and **3E** illustrate two different types of shaft **304** with identical function as they comprise similar electrical contacts for power, data, or both. Connector shown on FIG.

3D comprises a 3.5 mm jack like shaft where electrical contacts 308 are distributed vertically on the shaft 304. Connector shown on FIG. 3E consists of the same head 302 but shaft 304 resembles a bolt with threads as electrical contacts 308.

FIG. 3F reveals different embodiment connector 310, in which consists of a slightly different form of shaft 306 and base 312a with corresponding contact points in the cavity 306. This connector 310 incorporates a slider mechanism for coupling the connector 310 with the device 202, where ball bearing or other contact points are employed on the bottom of the base 312a and reciprocal part 312b of the device 202.

FIG. 3G shows another example of a connector 324 employing different shaft body 320 and contacts 322. On cross-section of one embodiment 326, contains a ball bearing for contacts 322 on each of the four sides of the shaft 320 while another embodiment 328, also on cross-section, illustrates a single ball bearing 330 that serves as contacts on all four sides of the shaft 320.

FIG. 3H is an example of electrical contact 214 on the concave wall 216 of the connectors 300. This particular type of contact 340 comprises an orifice 346 where a thin metal-like 342 strip with a wire 344 connected to the corresponding contact in the shaft 304. The side view 348 of the metal-like strip reveals the elasticity characteristic of the strip 342 for pushing against the electrical contacts of the inbuilt-battery necklace 240 while giving the connector 300 an ability to efficiently glide on the necklace 240. When all metal strips 342 in the concaved cavity of the connector head 302 in contact with the corresponding contacts on the necklace with inbuilt-battery 240, electrical currents and/or data signals will be transmitted.

FIG. 3I is another embodiment of the inbuilt-battery necklace, where opened connector 301 (shown on FIG. 3C) can easily be hooked for battery source when contacts 354 on connector 301 coupled with corresponding contacts 352 on the necklace 350. Such connector 301 can be easily removed from or rejoined the necklace 350, earrings, bag decoration chain, etc. This opened connector 301 may allow for interchangeable and reuse of the connectors in accordance with embodiments for fashion earrings, pendants, bag decoration tags, or key chain tags, etc.

FIG. 3J shows front view of examples of where connector receptacle 230 can be housed in the device 100, and it's not restricted to only the top of the device 100 as shown on FIG. 2A-D. Connector receptacles 230 can be integrated in more than one location and in any location of the device 100 as illustrated here.

FIG. 3K exemplifies another embodiment 355, of the connector receptacle 230. The connector receptacle 230 is integrated with a rotatable circular housing 356 which provides the connector receptacle 230 with the flexibility to rotate within 90 degrees. In some embodiments, the connector receptacle 230 can rotate up to 180 or 360 degree depending on the form factor and profile of device 100. This embodiment is advantageous when other add-on devices are better suited or needed for coupling on the sides rather than top or vice versa. Unlike the restriction of housing the connector receptacle 230 on the top of devices 202 shown on FIG. 2A-D, integrating such unique design 355 on the four corners as shown on 358 provides the flexibility for coupling another add-on device on any side, especially when add-on device comprises two male connectors for better stability.

To avoid electrical contact or signal complications, only contacts of one connector receptacle will be active while the other connector receptacle will temporarily disabled should

device 100 detects both connectors are from the same add-on device unless contacts provides different signals or different use cases.

FIG. 3L illustrates few embodiments of male & female connectors. Similar to the slider connector shown on FIG. 3F, it integrates with one or more sides of the device 100 and connectors 312a, 313b. The device or connector can provide one female 360 while the other side provides one male 362 (as shown on 364), or both sides provide females 360, or both males 362 as illustrated on 366 and 368, respectively. This is advantageous for device 100 to couple with more than one connector, therefore more add-on devices or battery packs are possible with this embodiment in accordance with the present application. In some embodiments, such connectors 360, 362 can be incorporated to one or more sides, not restricted to a mandatory or maximum of two sides.

FIGS. 4A-4D illustrate different embodiments of earphone 400. Shown in a perspective view, the earphones 400 on FIGS. 4A and 4B are very similar, both consisting of an earbud 402 and neck 404 connecting to the base 406a, 406b where FIG. 4A shows a wheel 406a while the base for another embodiment in FIG. 4B is a spherule 406b. Both bases 406a, 406b enable earbud 402 to be retraction with their rotating nature. These retractable earphones are integrated with devices 100 in accordance with embodiments of the present application.

FIG. 4C provides a side view of an earphone 400 similar to that shown in FIG. 4A, yet with a different form factor of the neck 450, with an ear tip 452 for easier use and comfort with an angled or curved form factor in some embodiments. Lengths of the neck 450 may vary while it curves.

To use the wireless headsets 100, the earphone 400 will be sprung out 454 when the release button 456 is pressed. The release button 456 may be an integral part of the flip mechanism similar to many of today's automobile remote controller with flip key mechanism built-in. Earphone 400 can be restored 458 back inside the device 100 simply pushing it toward the device 100.

FIG. 4D illustrates another embodiment of wireless headsets 100 where the entire headset 420 can be detached by twisting the base 428 counter-clockwise. This unique headset design 420 comprises the same components of wireless headset described on diagram 100 in FIG. 1A. When headset 420 is not in use, a user can conveniently store it away by placing it back at the end of the inbuilt-battery circular pendant 430, then twisting the headset 420 clockwise to fasten. While headset 420 is fastened with the battery-integrated pendant 430, internal battery of the headset 420 can be charged through its electrical contacts 426a and 426b coupled, providing headset's battery source is less than 100% full. Similarly, integrated battery of pendant 430 is also charging when it's connected to connector 432 which in turn is connected to the battery-integrated necklace 434 only when both conditions applies: (1) battery source of inbuilt-battery on pendant 430 is less than 100% and (2) inbuilt-battery of necklace is greater than 0%. Otherwise, no charging activity occurs between batteries of pendant 430 and necklace 434. If battery level of pendant 430 is 0% or near zero while headset 420 is coupled with device 430 which coupled to the battery-integrated necklace 434, headset 420 will be charged via battery source of necklace 434.

FIG. 5A-5D details various retractable earphone systems in a cross-sectional view in accordance with embodiment of the present application.

FIG. 5A shows a retracted earphone 502 housed in the wireless headsets 500 which can be integrated to a fashion pendant, earrings, cufflink, and any other wearable fashion

accessory. Earphone **502** contains the speaker portion with transducer **504** and neck **506** where parts or all electronic circuitry and internal rechargeable battery are housed. In some embodiments, the speaker portion with transducer **504** and/or parts or all electronic circuitry, microphone, and internal rechargeable battery are housed in other sections **514** of the wireless headsets **500**. The cylindrical neck **506** contains an elastic tap **508** that latches to the lower slot **520** to keep the spring compressed **512a** and earphone **502** remains retracted.

To use the earphone, a user simply presses the release button **510** to allow earphone **502** to spring out from the wireless headsets **500**. Then earphone is pulled slightly outwards and twisted clockwise to fasten earphone **502**, where the threads **526** that are convexly integrated around the bottom of the cylindrical neck **506** are interlocked with the outer threads **524** of the concaved wall that uniformly houses the cylindrical neck **504** so earphone **502** is in stable and locked position as shown on the next Figure. The speaker portion **504**, includes a faceplate **503** with a pattern of apertures for allowing sound to pass through from transducer to the user's ear, placed into eardrum—users can use wireless headsets **500** for voice communication (hearing and speaking) with connection to mobile telephone **150** or simply enjoy audio content that is transmitting **152** directly from mobile phone **150** to wireless headsets **500** be they a fashion pendant or earrings.

FIG. **5B** illustrates an earphone **502** is ejected and in a locked position where spring is reinstated **512b**. To retract and restore earphone **502** back inside the wireless headset **500**, user must twist earphone **502** counterclockwise to unlock threads **526** that are interlocked with the threads **524** of the housing of the earphone **502**, then push earphone **502** in until a 'click' sound, whereas the elastic tap **508** is moved from upper slot **522** to lower slot **520** where earphone **502** is now in a locked and retracted state. When earphone **502** is ejected, a large circular orifice that houses the earphone **502** is visible and, with the neck extension, it creates sufficient space for earphone **502** to comfortably fit in one's ear canal with the outer wall of the wireless headsets **500** being in the way.

FIGS. **5C** and **5D** represent slightly different embodiments.

FIG. **5C** illustrates an embodiment with speaker portion **504** that includes a faceplate **503** with a pattern of apertures for allowing sound to pass through from transducer to the user's ear. Faceplate **503** is used to direct sound from transducer toward the user's eardrum, regardless of whether earphone is in user's right ear or left ear. Speaker portion **504** is operably coupled to the neck **506** of earphone **502** where neck portion **506** can be cylindrical, squared, or in another shape. This embodiment does not have threads **526** on the earphone neck like the example shown on FIGS. **5A** and **5B**, but instead the neck **506** consists of a first elastic tap **508** and a second elastic tap **509**. The matching lower slot **620** is for locking first tap **508** so earphone **502** can be retracted and in a locked position while storing earphone **502** on a large circular cavity **516** inside the wireless headsets **500**. When lower release button **510** is pressed, the compressed spring **512a** causes the earphone **502** to be ejected.

FIG. **5D** shows the earphone **502** in an ejected state with first elastic tap **608** is stopped by upper left slot **522** so earphone **502** is not ejected much further, which may cause earphone **502** to be departed from housing **514** of wireless headsets **500** while second elastic tap **509** secures the neck **506** via upper right slot **523**. Earphone **500** is ready for use when it's ejected. To retract the earphone **502**, user simply presses the upper release button **511**, while simultaneously pushing the earphone **502** in (downwards) until the second

elastic tap **509** is latched with lower right slot **521** in time, when the "clicking" sound is present.

A sensor or mechanism may be employed on this embodiment where an incoming phone call is automatically answered when lower release button **510** is pressed or spring is fully reinstated **512b**, and an active phone call automatically disconnected if upper release button **511** is pressed or spring is fully compressed **512a** as part of the detection mechanism.

Reduced profile form factor of wireless headsets **500** shown on FIG. **5A-5D** may allow integration with jewelry and fashion accessories, where the ability to hide the earphone **502** or wireless headset **500** entirely is beneficial.

It should be understood that the embodiments described here in accordance with the present application are not limited to a specific and any appropriate designs of earphone and engineering of retractable mechanism. Examples shown on FIGS. **5A-5D** can be integrated in a round, square or any shaped housing with various thickness, length, and width.

FIG. **6A** illustrates a wired earbud-style headphone **600** that is integrated with a fashioned necklace, where necklace **602** comprises a built-in battery and electrical contacts for transmitting power, data, or both when it is connected to the device **202**, **100** through the connector **604**. In one embodiment, the wired headphones **600** contains one earphone **606** with microphone **607** integrated and, on the other end, it provides a round ring **608** with non-locking gate mechanism **610**. In some embodiments, ring **608** may be integrated without non-locking gate mechanism **610**. When fashioned headset necklace **600** is hanging on user's neck, it is slightly pulled by the pendant-like device **202**, the earphone **606** and ring **608** pull again each other to create an interlocking result of the necklace **600** due to the uniquely tailor-made concave-shaped neck **611** of the earphone **606** as shown on drawing **612**.

When connector **604** from the wired headset necklace **600** is attached to the fashion pendant-like device **202**, the microphone and speaker that are integrated with the device **100** will be disabled while other functionalities of the device **100** are still operable and device **100** still communicates **152** with the mobile telephone **150** or other computing devices with wireless communications such as Bluetooth.

An example of this embodiment is more apparent with the drawing **614**, showing the wired headset **600** is worn by a user with earphone plugged into her right ear and the fashion pendant device **202** attached to the battery-integrated necklace **602** or lanyard via connector **604**.

FIG. **6B** shows another embodiment of the wired earbud-style headphones, where both left earphone **620a** and right earphone **620b** have identical form factors with identical concave-shaped necks **622a**, **622b** except one has a microphone **607** integrated to the earphone **620a** while the other earphone **630b** does not. Drawing **618** shows the two earphones **620a**, **620b** of the wired headphones **616**, fastened to each other like Ying & Yang to form a closed loop, inter-locking necklace.

FIGS. **7A** and **7B** exemplify the digital fashion necklace & pendant system **700** in accordance with two embodiments of the present application. Shown on FIG. **7A**, the first embodiment illustrates the device **710** and two additional pendant-like rechargeable batteries **712** that are not attached to the necklet **714**. Fashioned necklace or necklet **714** provides built-in internal rechargeable battery and at least one connector **716** for connecting device **710** to necklace, for wearing in concurrent to recharging the device **710** when coupled. In this embodiment, the fashioned necklet **714** comprises three connectors which one is for the device **710** and the other two connectors **716** are for pendants with internal rechargeable battery integrated **712**.

FIG. 7B reveals similar system 700 with rounded pendant-like device 720 and rounded battery pack 722 that are connected by chains 726. The other decorative elements 724 may contain built-in internal rechargeable battery for powering and/or recharging the device 720. In some embodiments, device 720 may incorporate retractable earphone mechanism such as the ones shown on FIGS. 5A-5D especially for

embodiments that provide thinner profiles of device 720. FIGS. 8A and 8B illustrate the system 800 used as earrings in accordance with embodiments of the present application which consist of the earphone 810 with integrated rechargeable battery, and the additional battery 812 connected by a chain 814, where electric current can be transmitted to earphone 810 of the earring system 800. While it's hardwired, chain 814 provides the flexible characteristic so earphone 810 can be moved and/or rotated for earbud to be placed in user's ear canal easily and conveniently when wireless headsets 100 is in use. In another embodiment, earphone 810 is attached to chain 814 through a thin, retractable wire where a battery source can be drawn from internal rechargeable housed on earring element 812 or other ornament elements. This retractable wire allows users to pull and place earphone 810 in the ear canal easily and comfortably to use the wireless headset 100. The Earphone may employ a push-to-retract or pull twice to retract mechanism.

Electronic components and circuitry can be housed with the earphone 810 or battery pack 812 or in both enclosures 810, 812. In another embodiment, a battery may not be integrated with earphone 810, and therefore power must be drawn from battery pack 812 through chain 814. As shown on FIG. 8B, in certain earrings design, a smaller version connector 816 like the device connector 300 shown on FIG. 3A-G may be employed for allowing users to add or remove earring elements if desired while serving as contacts for passing electrical currents and/or transmit electrical/digital signals for voice calls.

It should be understood that the pendants, earrings, necklace, and any jewelry and fashion accessories that are integrated with wireless headsets 100 or wireless terminal devices 100 in accordance with the present application, can be decorated and created with built-materials such as silver, gold, gems, etc. or in combination with plastics or the like and can be in any design and form factor—not limited to the examples shown here.

FIG. 9A-9C show three slightly different embodiments of digital fashion finger ring system 900 having wireless headsets 902 integrated with the ring portion 914.

FIG. 9A shows one embodiment, where the entire wireless headset 902 is housed in a single ornament element with faceplate 904 covers the speaker portion 906 where transducer is located along with other electronic components and rechargeable battery integrated in the lower portion 908 of the earset and neck 910.

The system 900 contains a wireless headset 902 which can be fastened to the ring portion 914 by twisting the headset 902 clockwise. Electrical current are transmitted from the ring portion 914 to charge the internal battery housed in wireless headset 902 through contacts 912a, 912b. Headset 902 can be quickly and easily removed by twisting counter-clockwise direction when there's an incoming phone call or whenever user need want to use the wireless headset 902. The ring portion 914 of the system 900 also include a port for recharging the internal battery that is integrated with the ring portion 914, simultaneously it also recharges the built-in battery of the headset portion 902 when it is coupled with the ring portion 914 when the charging adapter (not shown) is plugged into the ring portion 914 and power outlet (not shown).

In another embodiment, the charging port is not built into the ring 914 but instead the system 900 includes a charging adapter that comprises a male connector and connector receptacle that is comparable to 912a and 912b where 912b can be fastened to the male connector for charging and 912a can be fastened to the connector receptacle for charging. Yet, in another embodiment, wireless charging may be employed.

FIG. 9B is a drawing depicting another embodiment of the ring system 900 in accordance with the present application, where wireless headset 920 can be easily and quickly slide out from the ring portion 922 for use and may further include a release button and latch to secure the headset 920 while it's on the ring portion 922. The electrical contacts on both the headset 920 and ring 922 which not shown here are required mechanisms for transmitting electrical signals. Similar to the embodiment illustrated on FIG. 9A, the ring may comprise a charging port, and a charging adapter is required for charging the batteries integrated with the ring 922 and headset 920.

An internal rechargeable battery is integrated in both the wireless headset 920 and ring 922. When wireless headset 920 is not in use, a user can easily slide the headset 920 back to the ring portion 922 for charging. Wireless headset 920 houses all required electronic components that shown FIG. 1A (with or without a display while some advanced components such as certain sensors may be omitted in some embodiments), along with an integrated retractable earphone similar to the embodiments shown on FIG. 5 facing at the bottom of the headset 920.

FIG. 9C illustrate another embodiment of the digital fashion ring system 900 in accordance with the present application. It also comprises two parts: the wireless headset 930 and ring portion which further consists of the cap 932 and the ring portion 934. Headset 930 can be easily detached for use by twisting it counter-clockwise then pull up to access the gel-like earbud 940. When the headset 930 is detached, the cavity 938 in the cap 932 is visible where it is used for housing the earbud 940. The threads 936b around the cap 932 compliment with the threads 936a (not shown) inside the headset 930 which allows the headset 930 to interlock with the cap 932. In one embodiment, electronic circuitry that makes up the device 100 with internal rechargeable battery can be housed within the headset 930, while another rechargeable battery can be integrated with the cap 932 or ring 934 or both. In some embodiments, this headset 930 may comprises a small display screen on a flat or curved surface.

FIG. 10A shows the fashion bag decoration charm tag system 1000 in accordance with an embodiment where it can be incorporated in handbag or purse decoration charms. In one embodiment, the device 1010 is connected to an optional battery bar 1012 through connectors 1014a, 1014b that are joined by wired chain or lanyard that straps on the handbag 1016, where electric currents passes from connector 1014b of battery bar 1012 to the connector 1014a of device 1010 in turn charges the internal battery of the device 1010 and/or power the device 1010. A user may use the device 1010 by simply pull it off the connector 1014b and plug device 1010 back to connector 1014b, for recharging or hanging when it's not actively in use.

In some embodiments, additional battery 1012 for powering or charging device 1010 can be integrated inside the handbags 1002 or purses. Advantageously, this integration has the option to offer user with higher volume battery source as well as hiding the physical battery, will provide the flexibility for aesthetical and design purpose.

FIG. 10B exemplifies a keychain system 1020 in accordance with an embodiment. The same device 1010 and optional battery pack 1012 can be used in a keychain 1020

scheme. When device **1010** is attached to connector **1014a** in conjunction of additional battery pack **1012** which is also attached to second connector **1014b**, electric currents therefore transmits from optional battery pack **1012** to device **1010** via key ring **1018**. Users may use a bigger battery pack or more than one battery pack as long as connectors are present. In some embodiments, Key rings and key chains provide with more than two connectors and device **1010** may be incorporated in various keychain charms, key fobs, etc. where form factors, ornaments, design, size, finishes, etc. may vary—and should not be restricted to only the illustrations presented here.

FIG. 11A-11C exemplify several different embodiments in accordance with the present application.

FIG. 11A shows the wireless headsets **1110b** is integrated with the device **1110a** as part of the system **1100** in accordance with the present application where it can be hung and connected on a keychain, handbag decoration chain, necklace or any other fashion accessories. To use wireless headset **1110b**, user simply and easily pulls the headset **1110b** out from the device **1110a**. When the headset **1110b** is not in use, users may store it away simply by pushing it back to the designated slot mold on the device **1110a** where wireless headset **1010b** can be charged by the internal rechargeable battery of device **1110a** when device **1110a** and headset **1110b** are coupled providing electrical contacts on incorporated on both sides. When headset **1010b** and device **1110a** are attached as one unit **1100**, both headset **1110b** and device **1110a** can be charged simultaneously through a power adapter or additional battery pack(s) (not shown here) that are attached via the keychain, bag chain, necklace or other wired fashion accessories.

FIG. 11B shows another embodiment of the system **1102** in a slider mechanism where the wireless headset **1120b** can be slid out from or slide in to the device **1120a**. In this configuration, the headset **1120b** houses a retractable ear set **1122** similar to the embodiment shown on FIGS. 2B and 2C. To use wireless headset **1120b**, user can pull headset **1120b** downward until it is separated from device **1120a**.

On both systems **1100**, **1102**, an auto-detect mechanism for auto answering and auto disconnecting of phone calls can be employed as previously described in FIGS. 2B and 5C.

FIG. 11C exemplifies another system **1103** in accordance with an embodiment of the present application where the device **1130**, wireless headset **1132**, and additional (optional) battery pack **1134** are separate units. Battery packs **1134** can be used to charge device **1130** and headset **1132** when they all are coupled through respective connectors **1136a, b, c** where electricity passes via the special-made key ring **1138**. More than one battery pack **1134** can be attached and used so long as it is accommodated with a connector **1136**.

To use the device **1130** and/or the headset **1132**, a user simply pulls them out from the connectors **1136a, 1136b**, respectively. When finished using device **1130** and/or headset **1132**, user simply plug them back to the interchangeable connectors **1136a, b, c** for storing and recharging.

A User has an option to use the device **1110a, 1120a, 1130** for information viewing while simultaneously talking on the phone via the complementary headset **1110b, 1120b, 1132** OR the fashion pendant headset or earring-integrated headsets shown on FIGS. 7 and 8. Wireless headsets **1110b, 1120b, 1132** may communicate directly with their respective device **1110a, 1120a, 1130** which in turn transmits **152** data to and from mobile phone **150**. Headsets **1110b, 1120b, 1132** also could communicate **152** directly with mobile phone **150** that is concurrently communicating with device **1110a, 1120a, 1130** as shown on FIG. 1B.

FIG. 12A illustrates a system of digital fashion bracelet **1200** in accordance with one embodiment of the present application, where a wireless headset **1212** is integrated with the digital bracelet device **1210** which in turn transmits **152** data to and from the mobile telephone **150** or other computing devices wirelessly. While headset **1212** consists a female receptacle connector, bracelet device **1210** has a male connector built-in with an orifice for storing the headset's earbud and its neck that are part of the wireless headset **1212**.

To use the headset **1212**, user can quickly and easily pull it out away from the bracelet **1210**. If this action is taking place during an incoming call waiting to be answered, by pulling the headset **1212** off the bracelet **1210**, the incoming call is automatically picked up. When a user is finished with the phone call, the user can plug headset **1212** back to the bracelet **1210** to disconnect or end the call.

When headset **1212** is plugged in the bracelet **1210**, headset's internal rechargeable battery is automatically recharged from the internal battery of the bracelet **1210**, providing the electrical contacts of both the bracelet **1210** and headset **1212** are coupled.

In some embodiments, the device **100** is integrated with the fashion bracelet **1210** where it provides a touch display **1214** that covers parts of or the entire bracelet's convex surface for a user to interact with for content or functionality access. A segment of the display **1214** may be a flexible OLED while other segment(s) can be e-paper or the entire bracelet could be flexible OLED or e-paper or other display technologies.

In certain embodiments, the digital bracelet device **1210** has one ear set **1212** or a pair of ear sets **1220a, 1220b** integrated with the bracelet **1210** as shown on the next Figure.

FIG. 12B shows one embodiment of pair of wireless headsets **1220a, 1220b** coupling together as they're integrated with devices **100**. In addition to fashion bracelet, this arrangement certainly can apply to the digital pendant, keychain tag, and handbag tag as well.

FIG. 12C exemplifies another embodiment of the digital fashion bracelet **1210** in accordance with the present application, where it comprises a display **1214** and all the components described in FIG. 1A but without an integrated headset **1212**. Therefore this particular embodiment allows for viewing and accessing content via **152** the mobile phone **150**. It may include a microphone and loud speaker phone as described in mentioned diagram **100** while connecting bracelet **1210** or mobile phone **150** with another fashion accessory such as pendant-like headset (like the one shown on FIG. 7), earring headsets (like the one shown on FIG. 8), or third party Bluetooth headset for accessing audio content and/or performing verbal telephone communication.

FIG. 12D shows a similar example of 12A but in bangle form factor—and may or may not have a built-in wireless headset—yet the display could be wrapped a full circumference of the bangle or only portion of it. The display can be OLED, e-paper, or other display technologies or in a combination and bangle can be closed loop or opened loop.

The mentioned embodiments are in accordance with the present application therefore it should be understood that these examples are not limited to only ladies jewelry and fashion accessories. The present application can also benefit men ladies jewelry and fashion accessories as shown on FIG. 13-15.

FIG. 13A illustrates fashion tie clip system **1300** in accordance with an embodiment of the present application. Retractable headset **1312** is integrated with the digital tie clip device **1310** which consists all components of a typical wire-

less headset (as shown on FIG. 1A) in addition to the clip itself **1314** where it functions as electrical contacts for the device.

When clipping the tie clip **1310** to the fashion tie **1316** that comprises a removable battery integrated **1318**. Battery **1318** is thin, flexible, and rechargeable which can be inserted inside the tie with partial or no battery visible even viewing from the back of the tie **1316**. In one embodiment, integrated battery provides four contacts **1320a, b, c, d** to correspond with the electrical contacts **1322a, b, c, d** of the tie **1316**. When these contacts are in contact, recharging from tie's integrated battery **1318** to the internal rechargeable battery housed inside tie clip **1310** to power the fashioned tie clip headset **1310** for communication.

In some embodiments, the electrical contacts **1320, 1322** could be more or less than four and could be used to transmit data in addition to power source on the tie clip system **1300**. Electrical contacts on the tie's integrated battery are not restricted to four small apertures shown on **1322a, b, c, d**, they can be slits that run parallels on the edge of the tie on one or both side as shown on FIG. **13B**.

FIG. **13B** illustrates another embodiment of a fashion tie **1316** that provides four slits to complement the four electrical contacts of the battery **1318** and the corresponding contacts (four separates contacts in single line) on the tie clip **1310**. Advantageously, having longer slits of electrical contracts gives users a greater area to attach the tie clip **1310** onto the fashion tie **1316** and still have electrical contacts, without having to clip the exact place with precision and it can be clipped on either left or right side of the tie **1316** deem to user's preference.

FIG. **13C** illustrates the same tie clip **1310** or similar designed accessories can be clipped to a shirt pocket **1330** where it provides a built-in removable battery inside the pocket similar to tie's integrated-battery **1318**. This thin, flexible rechargeable battery also provides the equivalent contacts (in terms of number of contacts and positioning) that run from left to right on the top of the end of the shirt pocket. In similar embodiments, wireless headsets can be designed in similar ways where they can be easily & quickly clipped inside a purse or other type of storage or bags for charging when additional power supply is needed.

FIG. **14** exemplifies a fashion cufflink system **1400** in accordance with one embodiment of the present application. Like the battery used for the fashion tie shown on FIG. **13A**, the shirt cuff **1402** provides a thin, flexible and yet rechargeable and removable battery **1406** that wraps perfectly around the cuff **1402** from the inside, with two or more electrical contacts **1424b** near or through the buttonholes **1404** where battery **1406** is not visible.

In one embodiment, a fashioned digital cufflink headset consists of two parts **1420a, 1420b** to form a capsule-like cufflink. First part **1420a** of the cufflink contains the electrical contacts **1424a** for transmitting power, data, or both when in contact with shirt cuff's battery contacts **1424b** around the buttonholes. First part **1420a** may houses all electronic components and circuitry for a functional wireless headset **100** along with an optional small display screen on the outer surface **1428** to display minimal information such as caller ID, time, alarm & calendar alerts, etc. It also consists of a male plug **1426a** with corresponding electrical contacts to charge second part **1420b** of the cufflink when it's plugged into the connector receptacle **1426b**. Second part **1420b** houses the speaker portion of the cufflink headset **1420b** with faceplate **1430** facing outward for transmitting sound to user's ear canal when placed in user's ear, when coupled with the first part **1420a**.

In another embodiment, all required components and circuitry for a functional wireless headset **100** are housed in the second part **1420b** of the cufflink, therefore it is not necessary for both parts **1420a** and **1420b** to couple in order for a functional wireless headset.

It should be understood that form factors, design, surface materials & finishes (gems, gold, etc.), color, and ornaments of the cufflink headset can varies for different embodiments, but all must house the components and circuitry of a functional wireless headset **100** with or without a small display screen and internal rechargeable battery on first part **1420a**, second part **1420b**, or distributed on both parts **1420a, 1420b**. It should contain at least one electrical contact **1424a**, let it be through the cufflink's shank, chain, bar or other means, thereby to transmitted electric currents from the corresponding contact(s) **1424b** of wearable battery **1406** that is integrated on the cuffs of the shirt.

FIGS. **15A** and **15B** show a digital fashion belt system **1500** in accordance with an embodiment of the present application.

FIG. **15A** illustrates an embodiment that consists of a removable wireless headset **1510** with retractable earbud **1516** and belt buckle **1520** where connector **1512** is anchored along with a battery-integrated belt panel **1522**. The thin, flexible, rechargeable battery **1524** is integrated inside the belt panel at part or full length of the belt. Wires **1526** run from the battery **1524** at the belt panel end that is secures the belt buckle **1520** to the contacts of the connector **1512** to supply power charging of the wireless headset **1510** when they are coupled by simply sliding headset **1510** along the slider **1514** on the upper part of the belt buckle **1520** until the connector receptacle **1518** interlock with the male connector **1512**. To use the wireless headset **1510**, users can easily slide it out in the reverse direction.

FIG. **15B** shows another fashion belt system **1501** of one embodiment, where the belt buckle is a dock **1540** of the terminal device **1550**. It provides flexible fingers **1542** with locking tabs to secure the device **1550**. These flexible fingers **1542** also function as electrical contacts for charging the wireless terminal device **1550** when they are snapped into with electronic contacts integrated with finger receptacle orifices (not shown here), on the back of the device **1550** where the front houses a display screen **1552** (e.g., OLED, e-paper, etc.). Belt panel **1522** may house a panel of battery **1524** as shown on FIG. **15A** or a slightly different embodiment where smaller battery bars **1544** are integrated and joined by wires **1546**, as exemplifies in FIG. **15B**, to provide electric currents to connectors **1542** for recharging device **1550** when device **1550** coupled on the dock **1540**. Users may use wireless terminal device **1550** for information viewing or media consumption while using a third-party Bluetooth headsets or a separate wireless headset that is integrated with a fashion pendant, ring, tie clip or other fashion accessories.

In addition to flexible finger and orifice mechanism that secure the device **1550** to the belt buckle dock **1540**, slider mechanism or other appropriate mechanism for coupling the device **1550** to the belt buckle **1540** can be employed.

In some embodiments, wireless headset **1510** is integrated with wireless terminal device **1550**, providing a retractable earbud for voice communication or listening to audio content streamed **152** from mobile telephone **150** or wireless computing devices.

FIG. **16A** shows a high level block diagram of an enhanced wireless device **1600**. It is an enhanced version of embodiment **100** shown on FIG. **1A**. The addition includes storage **1602**, slot for optional memory card (e.g., micro SD) **1604**, cameras **1606** (e.g., front and back), and GPS chip **1608**, slot

for SIM card **1610**, and cellular chip **1612** for device **1600** to communicate with cellular networks. Hereafter, this device **1600** will be referred to as “Wireless Device.”

FIG. **16B** exemplifies the wireless device **1600** in various views, which include the perspective view **1650P**, the front view **1650F**, back view **1650B**, and the side view **1650S**. Perspective view **1650P** of the wireless device **1600** consists of slider connectors, one on both sides in one embodiment, while the straight side view **1650S** shows the ball bearings **1652** with sliders similar to the mechanism shown on FIG. **3F** with connectors **312a**, **312b** but, in addition to width and depth, the length *L* of the connectors also varies and the sides may incorporate male and female connectors as shown on **364**, both female or male connectors are illustrated on **366** and **368**, respectively, as shown in FIG. **3L** in one embodiment.

In accordance with an embodiment of the present application, the ball bearing connectors as illustrated on the side view **1650S** of the wireless device **1600** consists of sixteen ball bearings **1652** as electrical contacts with eight side by side, with the slider bar **1654** (one on each side for female connector **366** as shown on FIG. **3L**). For example, each ball bearing contact represents a certain signal.

In this particular embodiment, electrical contacts **1652** may include: Power, Data +/–, Sense, Ground, Video, Audio, and bi-directional bus. The groupings of the eight contacts may be as follows: set of eight on the top (four side by side) **1656**, of eight on the bottom (four side by side) **1658**, set of eight on left side (eight in a vertical row) **1660**, and set of eight on right side (eight in a vertical row) **1662**. Advantageously, these groupings allow male connectors to mate in a reversible position (upside down) or two smaller male connectors (one on top while other on bottom).

FIG. **17A** illustrates the wireless device **1600** that was worn by user **1700** while FIG. **17B** exemplifies a fashioned digital bracelet **1710** with a display screen **1702** on the convex of its surface, in accordance with one embodiment of the present application, while the thickness, length and width may vary from one embodiment & design to another. This bracelet **1710** houses one or more internal rechargeable batteries and all required circuitry and firmware with or without integrated removable wireless headsets **1212** such as those shown FIGS. **12A** and **12B**. Wireless headset with or without retractable earbud(s) can be housed in any segment of the body **1708** of the fashioned bracelet **1710**. On both ends **1704** of the bracelet **1710** comprise slider connector receptacles where the mating connectors **1706**, on the sides of the wireless device **1600** can easily slide in and electrical contacts can be mated. Display **1702** can be OLED, LCD, flexible e-paper, or in combination and display **1702** can be a segment, multiple segments, or full length of the bracelet **1710**. FIG. **17C** illustrates when the wireless device **1600** is incorporated with the fashioned digital bracelet **1710**.

FIG. **17D** shows the wireless device **1600** with adaptive connectors such as those with mechanism shown on FIG. **3K** can be incorporated with the digital bracelet **1710** and other digital fashion accessories & jewelry. In this embodiment, the device **1600** consists of four rotatable connectors **1722a**, **b**, **c**, and **d**, with one on each corner. One end **1730a** of the bracelet **1710** comprises a male connector **1728a** and one port **1726b** while the other end **1730b** of the same bracelet **1710** includes one port **1728b** and male connector **1726a**. When bracelet **1710** is not coupled with the wireless device **1600**, the male connector **1728a** of the bracelet **1710** can be inserted to the port **1728b** while the other connector **1726a** inserted to port **1726b** for coupling both ends to fasten the bracelet **1710**. The wireless device **1600** can be coupled with the digital bracelet

1710 by inserting the male connector **1728a** from the bracelet **1710** into the connector receptacle **1724a** integrated in the device and inserting the other connector **1726a** to the other connector receptacle **1724c** of the device. Therefore built-in battery of the digital bracelet **1710** can be used to power and/or charge the wireless device **1600**. At the same time, a user can use the digital bracelet **1710** like a mobile phone taking user’s input via bracelet’s integrated and curved multi-touch display **1702**. In another embodiment, the connectors **1728a**, **1726a** integrated with the bracelet **1710** and the four rotatable connectors **1722a**, **b**, **c**, **d** integrated with the wireless device **1600** can be arranged differently. Also, it is not restricted to two male connectors **1728a**, **1726a** and four rotatable connectors **1722a**, **b**, **c**, **d**. The number of connectors and connector receptacles can be varied.

FIG. **18A** exemplifies various ways the unique wireless device **1600** can be used with companion devices **1810**, **1820**, **1830**, **1840** in accordance with an embodiment of the present application. Like the digital fashioned bracelet shown on FIGS. **17B** and **17C**, all of these companion devices **1810**, **1820**, **1830**, **1840** consists of a display (e.g., OLED) and internal rechargeable battery with the necessary circuitry and firmware a long with slider connector receptacles on the sides such as those shown on FIG. **3L**.

In one configuration, the connectors (on both sides) of the wireless device **1600** are both female **360** such as example **366** shown on FIG. **3L** while companion device **1810**, **1820**, **1830**, **1840** may contain one or more connectors (a male **362** or female **360**).

When wireless device **1600** coupled with a phone companion device **1810**, tablet companion device **1820**, another tablet companion device **1830**, or desktop flat panel monitor **1840**, wireless device **1600** may use its own internal battery for powering or drawing battery from companion devices **1810**, **1820**, **1830**, **1840** or drawing battery from companion devices only when battery source of wireless device **1600** is below certain capacity (e.g., battery source is less than 20%).

1840 can also be a flat panel television. An adapter (not shown) can be used for connecting wireless device **1600** to existing third-party TVs and desktop monitors that do not already have an appropriate connector integrated.

It should be understood that the connector and connector receptacle can be in a different form. For instance, connectors for wireless device **1600** and companion devices can be such shown on FIG. **3A** to **3K**, not restricting just the slider connector shown on FIG. **3L**.

In some embodiments, users can define or predefine when and how battery should be charging and/or powering a wireless device **1600** and companion devices **1810**, **1820**, **1830**, and **1840**. Companion devices **1810**, **1820**, **1830**, **1840** may also consists an integrated wireless headsets **1220a** & **b** as shown on FIG. **12B**.

It should be understood that, in addition to fashioned digital bracelet **1710** shown on FIGS. **17B** and **17C** as well as companion devices **1810**, **1820**, **1830**, **1840** shown herein, wireless device **1600** can also be incorporated with fashioned pendants, key chain tags, bag decoration tags, belt system, etc. Furthermore, wireless device **1600** are not restricted to be coupled with companion devices **1810**, **1820**, **1830**, **1840** on the left corner such as shown on FIG. **18A**—it can be coupled on anywhere of the device (e.g., middle, front, back, horizontal, etc.).

FIGS. **18B** and **18C** reveal electrical signals and currents of wireless device **1600** and add-on peripherals **1851**, **1852**, **1853**, and **1854** where add-ons can be companion devices **1810**, **1820**, **1830**, and **1840** as well. In accordance with the present application, wireless device **1600** and companion

devices **1810**, **1820**, **1830**, **1840** can be coupled, via a connector receptacle, with one or more add-on peripherals **1851**, **1852**, **1853**, **1854** such as: additional battery unit, keyboards unit, external speakers unit, wired or wireless headset unit, external storage, special camera unit, flash light unit, scanner unit, printer unit, non-functional ornament unit, etc.

Electrical signals can be transmitted directly to and from any of the add-on units **1851**, **1852**, **1853**, **1854** to the wireless device **1600** or transmitted to wireless device **1600** through one or more add-on units. For example, in one configuration in FIG. **18B**, a wireless device **1600** is coupled with an external keyboard (add-on #**1** **1851**) where add-on #**1** **1851** is coupled with a battery pack (add-on #**2** **1852**) where add-on #**2** **1852** is coupled with an external special camera (add-on #**3** **1853**) where add-on #**3** **1853** is coupled with a phone companion (add-on #**n** **1854**) whereas battery pack **1852** still can charge and/or power the wireless device **1600** through the non-battery-operable keyboard unit **1851**. In this same configuration, external camera **1853** draws power from the battery pack **1852** while phone companion **1854** uses its own battery source until it reaches below 10% before it taps into the battery pack **1852** for power while battery pack **1852** is charging wireless device **1600**. If wireless device **1600** has 90% battery capacity, it can still draw power from the battery pack **1852** but not for charging, while phone companion **1854** can be charged by the same battery pack **1852** should its battery capacity become less than 10%.

In another configuration shown on FIG. **18C**, wireless device **1600** is coupled with external storage (add-on #**1** **1851**), where add-on #**1** **1851** coupled with battery pack (add-on #**2** **1852**), where second connector of the wireless device **100** is coupled with another battery pack (add-on #**3** **1853**), where add-on #**3** **1853** is coupled with a tablet companion (add-on #**n** **1854**).

Wireless device **1600** should be considered as a primary device for battery charging priority and it should be prioritized over any of the add-on peripherals **1851**, **1852**, **1853**, **1854**, unless wireless device **1600** has 90% or greater battery source capacity and battery source of add-on peripherals **1851**, **1852**, **1853**, **1854** is 10% or less. In the same configuration, add-on peripherals for phone companion and tablet companion have the next priority (second priority) for battery charging over other add-on peripherals like camera, scanner, printer, non-functional ornament units, etc. For add-on peripherals (such as desktop monitor companion or TV companion) with plug-in power source, wireless devices and other coupled add-on peripherals (battery pack, wireless headsets, etc.) will automatically be charged and powered through the add-on peripheral with plug-in power source. Battery charging flow is described on FIG. **21B**.

FIG. **19A-C** illustrates a charging system in accordance with one embodiment of the present application. FIG. **19A** shows an example of a charger **1900** with the main body **1906** with attached power cord **1908** or cable with a Universal Serial Bus (USB) plug for charging through USB ports. Main body **1906** houses charging circuitry and at least one male connector **1904** and one female port **1902** for charging wireless headsets **100**, wireless terminal device **100**, wireless device **1600**, add-on peripherals, and any fashioned digital accessories with a female connector receptacle and male connector, respectively. In some embodiments, charger **1900** may comprise multiple male **1904** connectors and female ports **1902** for charging.

It should be understood that rechargeable batteries (described herein) integrated with the device **100**, **1600**, external battery pack, and other fashioned digital accessories are capable of bi-directional charging.

FIG. **19B** exemplifies the electricity flow of the charging system in accordance with one embodiment of the present application. For example, device **1920** is plugged to the male connector **1904** of the charger **1906** for charging. Concurrently, the charger **1906** also charges multiple units via connector **1912** that is plugged in the female port **902** of the charger **1900**. Electricity currents travels to the charging systems of the device **1922**, wireless headset **1924**, and external battery pack **1926** via the key ring **1910** by ways of respective connectors **1914**, **1916**, **1918**.

FIG. **19C** exemplifies another charging system using an external battery pack **1926** that is also an accessory attaching to the key ring **1910**. Electric currents travels from battery **1926** to key ring **1910** via connector **1918** in turn charges device **1922** through connector **1914** and concurrently charges the headset **1924** through connector **1916**.

Information of battery level of battery pack **1926**, wireless headset **1924**, and any other fashioned digital accessories that are attached to the device **1922** via the key ring **1910** will be sent to device **1922** for analysis and decision tree of how and the priority of digital accessories be charged. For instance, if battery level of wireless headset **1924** is greater than certain level (e.g., 90%) while battery level of device **1922** is less than certain level (e.g., 10%), battery pack **1926** will automatically dedicated to charge the device **1922** without charging the headset **1944** OR vice versa UNLESS otherwise assigned by user's preference.

FIG. **20A** exemplifies various shapes of internal battery. For example, battery can be square **2002**, rectangular **2004**, oval **2006**, circular **2008** or any other shape that may be apparent to a person of ordinary skill. It should be understood that batteries, in accordance with the present application, should not be limited to only these shapes—they can be any size and profiles deemed to fit the design of a particular fashion accessory or jewelry.

Internal rechargeable batteries can also be used in combination of shape and size. In one example, the necklet **2010**, shown on FIG. **20B**, houses one large battery **2012** with several smaller battery pack **2014** where they are connected via hardwires. In another embodiment, the necklet **2010** may house multiple batteries with identical size and shape and evenly distributed inside the necklet **2010**. Still another embodiment, the internal battery can be shaped like the necklet **2010**.

FIG. **20C** shows necklace **2020** designed with a string of gems. The oval gems also house a rechargeable battery in the same oval shape proportionally. In this particular embodiment, there are two larger oval batteries **2022**, numerous smaller oval batteries **2024** with a number of small circular batteries **2026** where they are all connected through wires **2028** that are wrapped with silver or the link. In another embodiment, the oval gems house rectangular-sized batteries that fit within the oval gems while the smaller circular **2026** may be omitted. Shapes, sizes, and profiles of gems can be varied and ornaments and design are not limited to gems—they can be silver, gold, or any other jewelry materials or in combination.

FIG. **20D** shows a cross-sectional view of a necklace **2040** where a series of small round batteries **2044** are integrated. In one example, a series of circular rechargeable batteries **2044** are strung by wires **2046**, as shown on enlarged view **2042b** of a small section **2042a** of the necklace **2040**, where negative is connected to positive of each battery. These rechargeable batteries can be shaped like a cell battery, stick, square, etc. Also it should be understood that these methods and systems to incorporate batteries into various fashion accessories and jewelry in accordance with the above described embodiments

is not limited to only necklaces or necklets—they can apply to other fashion accessories and jewelry such as rings, belts, earrings, pendants, bracelets, handbags, tags, etc.

FIG. 21A shows a flow diagram of device and add-on behaviors when they are coupled. For instance, when an add-on (e.g., companion device, external battery pack, etc.) is coupled with the device **2102**, add-on is automatically detected and information of add-on will be collected and sent to device **2104**, then device analyzes the information & status of each add-on **2106** before determine rules and sending these set of rules to add-on **2108**. At any time, if additional add-on is plugged in, this step **2102** restarts. At any time should one or more add-ons are detached **2110**, information & status of add-ons will be re-gathered and resend as shown, hence, the process jumps back to step **2104**.

FIG. 21B shows a flow chart of powering & charging system. When a battery is attached to the device or headset or via any means **2112**, battery or batteries as well as add-ons are automatically detected then information will be gathered and sent to device **2114**, then device analyzes attached battery or batteries as well as any attached add-ons **2116** before setting rules **2118**. After rules are determined, rules and instructions, on how power consumption and distribution should be as well as charging priority given data of battery at present stage and/or user preference, are sent to add-ons **2120**. If at any time should a battery or any add-on is detached **2122**, step **2114** will be restarted.

FIG. 22 shows the user interface system in accordance with the present application. Regardless if it's a wireless headset **100**, wireless terminal **100**, or wireless devices **1600**, the user interface mapping applies to them—be it a fashion pendant, bracelet, or bag/keychain tag and with or without display. Below is an example system for controlling the device **100**, **1600**. Of course other systems may be developed by a person of ordinary skill with similar concepts discussed below while remaining within the scope of the present application.

The segments (A, B, C) and the corresponding touch positions (LF, RF, LS, and RS) also apply and relevant for digital bracelet **1600** when and after users centered the display. To center display on bracelet, use thumb to press the screen surface with index finger touching the back of the bracelet (the surface behind the display) on any segment of the bracelet. On all embodiments, the segregation of the three segments (A, B, C) could be dots or lines on both sides for tactile convenience.

Controlling Mobile Telephone/Device when Incoming Call is Waiting to be Answered:

To pick up the incoming call: Squeeze LS1 and RS1 simultaneously for 2 seconds.

To send to voice mail: Squeeze LS2 and RS2 simultaneously for 2 seconds.

To silent ringer and/or disable vibration: Squeeze LS3 and RS3 simultaneously for 2 seconds OR shake headset/device back and forth several times.

Controlling Mobile Telephone/Device when Voice Call is Active:

To increase voice volume: Lightly squeeze both LS1 and RS1 and stroke fingers downward motion toward to LS3 and RS3, respectively.

To lower voice volume, lightly squeeze both LS3 and RS3 and stroke fingers upward motion toward to LS1 and RS3, respectively.

To end the active phone call: Squeeze LS1 and RS1 simultaneously for 2 seconds.

To mute the active phone call (where other party CANNOT hear you):

Place one finger on LS1 while the other on RS3 then stroke the one that is placed on LS1 downward to LS3 concurrently stroke the finger that is placed on RS3 upward toward RS1.

To un-mute the active phone calls (where other party CAN hear you):

REVERSE THE PROCESS. Place one finger on LS3 while the other on RS1 then stroke the one that is placed on LS3 upward to LS1 concurrently stroke the finger that is placed on RS1 upward toward RS3.

Controlling Mobile Telephone/Device when Media (Audio/Video) is Playing:

To stop/pause media playing: Double-tap LS1 and RS1 simultaneously.

To skip back one track (REWIND): Double-tap LS2 & RS2 simultaneously.

To skip one track forward (NEXT): Double-tap LS3 & RS3 simultaneously.

When Headset/Device is on Standby Mode:

To activate voice command: Squeeze LS2 & RS2 simultaneously for 2 seconds—and hold while speaking the command toward microphone then release both fingers from LS2 & RS2.

To response to a voice command: Squeeze and hold LS2 & RS2 simultaneously—and speak immediately.

To access menu: Squeeze LS3 and RS3 simultaneously for 2 seconds

Navigating/Viewing Content on Screen Display:

To go back one page: Tap LS1 once OR flick LF2 upward toward LF1 (or flick RF2 upward toward RF1)

To skip forward one page: Tap RS1 once OR flick LF2 downward toward LF3 (or flick RF2 downward toward RF3)

To select the highlighted item on screen: Double-tap LS2 & RS2 simultaneously.

To scroll page down: Squeeze LS1 & RS1 together and stroke downward motion toward LS3 & RS3 simultaneously.

To scroll page up: Squeeze LS3 & RS3 together and stroke upward motion toward LS1 & RS1 simultaneously.

To zoom in: Place one finger on LS1 while the other on RS3 then stroke the one that is placed on LS1 downward to LS3 concurrently stroke the finger that is placed on RS3 upward toward RS1. OR place side of index finger on RS2 (or LS2) with thumb smudges upward from RF2 (or LF2) to RF1 (or LF1).

To zoom out: REVERSE THE PROCESS. Place one finger on LS3 while the other on RS1 then stroke the one that is placed on LS3 upward to LS1 concurrently stroke the finger that is placed on RS1 UPWARD toward RS3. OR place side of index finger on RS2 (or LS2) with thumb smudges DOWNWARD from RF2 (or LF2) to RF1 (or LF1).

With Content/Programs Active on Screen:

To enter screensaver at any time: Drop wireless terminal from chest height down below waist OR shake device fast randomly several times.

To entering menu/computing mode while on screensaver mode: Squeeze LS3 and RS3 simultaneously for 2 seconds.

Specific to Circular Bracelet with Closed-Loop

To enter screensaver at any time: Drop wireless device down below waist OR shake device fast randomly several times.

To center viewing area (section A to C, A and B, B and C, or B only) of the display screen on bracelet (any segment): Thumb presses the screen surface with index

finger touching the back of the bracelet (the surface behind the display) on any segment of the bracelet.

To increase volume, place index finger on the back of bracelet (the surface behind the display) while thumb smear from RF2 (or LF2) UP towards RF1 (LF1)

To lower volume, place index finger on the back of bracelet (the surface behind the display) while thumb smear from RF2 (or LF2) DOWN towards RF3 (LF3).

To answer an incoming phone call: Squeeze both sides simultaneously (on the edge) of the bracelet (any segment) for 2 seconds OR pull out wireless earphone (if available on the embodiment).

To silent ringer and/or disable vibration while an incoming call has not been answered: Shake bracelet several times.

To end an active phone call: Squeeze both sides simultaneously (on the edge) of the bracelet (any segment) for 2 seconds OR insert wireless earphone back to integrated port (if available on the embodiment).

To mute the active phone call (where the other party CAN-NOT hear you):

Place thumb on one side of the bracelet (edge) with index finger on the other side of the bracelet then stroke one finger downward while the other finger stroke upward simultaneously.

To unmute the active phone call (where other party CAN hear you): REVERSE THE 'MUTE' PROCESS.

To active voice command: double tap on both sides (any segment) of the bracelet and squeeze for 2 seconds—and hold while speaking the command toward the microphone (or wireless earphone). Release fingers, when done speaking, for device to compute and response.

To response to a voice command: Within 2-3 seconds, squeeze and hold both sides (any segment) of the bracelet simultaneously and speak immediately. Release squeeze when done speaking and wait for device to compute and response.

To access menu: Triple tap both side of the bracelet (any segment) To zoom in while viewing content on display: Place one finger on LS1 while the other on RS3 then stroke the one that is placed on LS1 downward to LS3 concurrently stroke the finger that is placed on RS3 upward toward RS1. OR place side of index finger on RS2 (or LS2) with thumb smudges upward from RF2 (or LF2) to RF1 (or LF1).

To zoom out while viewing content on display: REVERSE THE PROCESS. Place one finger on LS3 while the other on RS1 then stroke the one that is placed on LS3 upward to LS1 concurrently stroke the finger that is placed on RS1 UPWARD toward RS3. OR place side of index finger on RS2 (or LS2) with thumb smudges DOWNWARD from RF2 (or LF2) to RF1 (or LF1).

Additional Embodiments and configurations are discussed below with respect to FIGS. 23A-30. Aspects of these embodiments may be similar to aspects of the embodiments discussed above and aspects of any of any of the embodiments discussed in the present application may be combined without departing from the scope of the present application.

As discussed above, smartphone wrist accessories began the process of establishing the 'wearable' trend. The ideal wearable device—at least for consumers—is something sleek, stylish, and comfortable—with the electronic package interchangeable where consumers can easily remove them and transfer them to another piece of jewelry or fashion accessory to maximize their investment in the digital communication apparatuses as with the embodiments described herein. As a result, benefits may be enjoyed by consumers as they are now able to maximize their investments and luxuriate

in their digital jewelry and accessories, without having to purchase the electronics package separately for multiple accessory or jewelry items.

In an exemplary embodiment, a "Device Platform" which includes all the components and circuitry necessary for wireless computing and connectivity, but excluding the battery and display may be provided. Such components and circuitries may include, but are not limited to, a printed circuit board, memory, communication interface (e.g., Bluetooth, NFC, etc.), GPS, accelerometer, vibration motor, and processor for executing software that drives a user display interface and content on a screen (e.g., touch screen), and transmits data to and from interlinked wireless devices (e.g., smartphone) and/or the wireless network itself, when coupled with an add-on fashion accessory providing for a battery source.

Add-on accessories are a companion apparatus to the device platform. It can be, but not limited to, a digital pendant, necklet, bracelet, bangle, keychain tag, handbag decoration tag, etc. as discussed above. Add-on accessories are fabricated first for their design as a jewelry or fashion accessories—typically houses an internal rechargeable battery and receptacle connector to the device platform's connector and may or may not include a display. Generally, add-on accessories are not functional when not coupled with the device platform. However, in some embodiments where e-paper display technology (e.g., E-Ink) is employed, users may be able to use the add-on accessory's display to show a graphic image/pattern as a wallpaper for fashion or aesthetic reasons even with the device platform detached and/or without battery power. The equivalent of a PC opening screen with interchangeable wallpaper backgrounds can become an inherent part of the jewelry or accessory item design or look. The wearer could select a color of denim to match different denim outfits or upscale the jewelry or accessory item by selecting different colors and patterns such as pattern of her dress, gold or silver mesh or any combination of one or more precious or semi-precious stones in place of the denim wallpaper.

When the device platform is coupled with an add-on accessory, the users will have a fully functional wireless terminal device and are empowered to access and control their mobile phone easily and quickly without ever removing it—even from their pocket or handbag—whether it be a phone call, music playback, text messages, or social network alerts & updates. Embodiments may effectively allow a consumer to avoid missing a call or being the last to know about a Facebook update or important Tweet—because their phone was in their handbag or pocket for the previous two hours. Furthermore, in some embodiments of the present application, users may track calories burned, steps taken and other daily movements to monitor health activities—as well as loss prevention and recovery of mobile phone, accessories, and any apparatuses that are interlinked.

The device platform or electronics package is constructed in one or more segments or modules that are attached to a flexible strap. One aspect of the exemplary embodiment consists of four segments (or sections or modules) where all the components and circuitry for a fully functional computing capability are housed. The edges of the strap include magnets for convenient and easy removal and then attaching it to various digital fashion accessories having electrical contacts at one or more ends.

In another embodiment, straps may employ button-like, finger, or other methods for the device platform to adhere to an add-on accessory yet not restrict its use to only using magnets. A further exemplary embodiment comprises more than one set of electrical contacts (e.g., one connector on each end).

The flexible or semi-flexible strap can be a ‘ribbon cable’ shaped to any curvature (upward or downward; or any direction) or function as a straight/flat strap; therefore enabling the device platform to easily adapt and fit into or onto any shaped cavity (any arc or flat surface) required by the fashion or jewelry design.

The device platform itself is user interchangeable and adaptive, so that it may be easily removed and coupled with any companion digital fashion accessories (add-on accessories) in a manner referred to herein as “coupling”. Coupling is defined herein to mean inserting or attaching the device platform to an add-on accessory (digital fashion accessory) so that the device platform is not visible—or at least partially covered by the fashion accessory for aesthetic reasons. Coupling is defined herein similar to “docking”.

“Add-on Accessories” defined herein include, but are not limited to, digital bracelets, bangles, pendants, earrings, bag decoration tags, and key chain tags, etc.—and can be any form factor, size, finish, color, material, etc. “Add-on accessories” herein also may be referred to as “Fashion Accessories”, “Digital Accessories”, or “Companion Accessories”—and may include built-in display(s), battery, loud speakers, directional microphone, camera(s), sensors (e.g., touch, proximity, etc.), antennas, memory card slot, etc.

In accordance with an embodiment of the present application, digital fashion accessories such as bracelets, pendants, and tags may include a display and/or rechargeable battery. In some embodiments, fashion accessories also house components and mechanism for wireless charging and with additional antenna(s) integrated for enhanced wireless signals—and may employ more than one display (e.g., LCD, OLEO, e-paper, or combination of display technologies). Add-on accessories house a receptacle connector (electrical contacts) for mating with the device platform so power can be supplied from any add-on accessory’s integrated rechargeable battery to the device platform as well as transmitting data to and from both coupled apparatuses (device platform and add-on accessory).

When a removable device platform is coupled with an add-on accessory, through electrical connections, the battery that is integrated with the add-on accessory powers its components (e.g., display, sensor, button, etc.) as well as the device platform itself—in turn, full computing functionality is therefore available and operable. Subsequently, information and user interface can be transmitted (through the same removable, coupled electrical contacts) to the display or displays of the attached add-on accessory. As a result, a fully functional ‘Wireless Terminal Device’ is transformed by coupling the device platform with an add-on accessory. In certain embodiments where one or more described components (e.g., display, camera(s), etc.) may be omitted on the add-on accessories, these add-on accessories are still fully functional for dedicated use situations and value propositions when coupled with the device platform.

The user interface may be controlled by a user interacting with the touch display, voice commands, or tactile surfaces of add-on accessories, as well as gestures (motion) control via accelerometer and/or other sensors should physical button(s) or other mechanism for controlling or navigating the user interface be completely absent from both the device platform and the add-on accessory or due to user preference.

The user can pair the wireless telephone and wireless terminal device by having them both in contact or close proximity physically. This can be done using NFC or equivalent technology, and is only required to be performed for the first time unless the wireless connection is broken or unpaired which then requires re-pairing. Once paired, wireless connec-

tions (e.g., Bluetooth) between wireless telephone and wireless terminal device are active—and users can start using the wireless terminal device to access and control their wireless telephone. Alternatively, the ‘pairing’ can be done via Bluetooth pairing or other means.

In some embodiments, the wireless terminal device can transmit data to and from wireless telephone via a Wi Fi network.

It should be understood, the device platform can also include the cellular transceiver and SIM card integrated—therefore it is a fully-functional wireless communication device with the capability of today’s smartphones. Furthermore, in addition to digital fashion bracelets, the methods described for building an interchangeable and adaptive device platform can also be used in developing a similar device platform for other companion fashion accessories such as earrings, pendants, key chain tags, bag decoration tags, etc.) and not limited only to form factors of bracelets and bangles.

The exemplary embodiments may provide a new and improved method of designing and manufacturing wireless terminal devices (companion terminal devices)—by providing an interchangeable, versatile platform to facilitate the design and incorporation of digital communication functionality with fashion accessories and jewelry, without the need for extensive in-house technical know-how by fashion accessory and jewelry designers, even OEMs. The benefits include, but are not limited to: speed to market, reduced costs and technical risks, and digital accessories/jewelry can be designed with minimal or no technical expertise required.

Furthermore, device platform may also be easily user interchangeable with any compatible add-on accessories. No tools or cumbersome assembly and disassembly required to have a fully functional wireless terminal device. Advantageously, consumers can maximize their investment by leveraging the “same” interchangeable device platform for numerous bracelets, key chain tags, and bag decoration tags, with different form factor and designs. The same is true with device platforms for pendants and other add-on accessories. In one embodiment, an interchangeable device platform that is designed for a pendant can be coupled and operated with a variety of different pendants as well as other companion fashion accessories such as a brooch, bracelet or earrings.

The device platform can be both an interchangeable hardware package that can be removed and coupled with other multi-function companion fashion accessories, or it can be integrated and housed inside certain add-on accessories.

With reference to FIGS. 23A to 30, various embodiments will now be described in more detail. Examples are illustrated in the accompanying drawings. It is understood that the figures and the example embodiments to which they relate are not intended to limit the systems and methods describe herein to only the described embodiments or visual representations. To the contrary, it is intended to cover alternatives, modifications, and equivalents as may be included within the spirit and scope of the present application.

FIG. 23A shows a high level electronics block diagram of a device platform in accordance with one embodiment. This embodiment is designed to transmit digital data or a digital equivalent data language or format to and from wireless communication or computing devices (e.g., wireless telephones, tablets, Wi-Fi networks, etc.) using their existing wireless air-interface protocol. In another embodiment, the device platform may be equipped with a cellular transceiver and SIM card, therefore capable of a fully functional smartphone and

capable of transmitting data to and from various cellular networks (e.g., 4G mobile networks) directly or other wireless networks (e.g., Wi-Fi).

In accordance with another embodiment, the device platform consists of, but is not limited to, a controller, memory (e.g., RAM and SSD/storage), video/audio processor, GPS, vibration motor, accelerometer, sensors (e.g., touch, etc.), various communication interfaces (e.g., Bluetooth, etc.) as well as a connector (e.g., electrical contracts) to transmit data and electrical signals or pulses to and from receptacle connectors of companion fashion accessories—while in some embodiments, the device platform may also include a rechargeable battery, power (ON/OFF) button or switch or a microphone for audible commands and instructions, memory card slot (for extra memory storage), and/or speech processor (for voice recognition, speech-to-text, etc.).

In addition to Bluetooth air-interface, the device platform also may consist of other wireless interfaces such as Near Field Communication (NFC), Wide Area Local Network IEEE 802.11 standards (e.g., Wi-Fi), Radio-frequency identification (RFID), cellular network transceiver, and functionally similar future protocols and air-interfaces.

FIG. 23B shows a high level block diagram of a typical add-on accessory (companion fashion accessory). Unlike any existing Bluetooth devices in the market today, add-on accessories in accordance with the systems and methods described herein may include a physical push-to-talk button, or a touch sensor to empower users to activate the integrated speech command function with device platform through the built-in speech processor. Touch sensors (single point or multi touch) may allow users to control the device platform without traditional buttons—and can be integrated to the fashion accessory itself, not limited to only on touch display (e.g., speech recognition).

In certain embodiments, add-on accessories such as digital bracelets and bag decoration tags may consist of a display or displays, whereas it can be a touch or non-touch LCD, OLED, or flexible e-paper, while some other embodiments may comprise of a combination of these display technologies (e.g., part OLED and part e-paper) in accordance with the systems and methods described herein.

Further in accordance with an embodiment, add-on accessories could house an internal rechargeable battery equipped with a connector for hardwired charging, and/or a mechanism for wireless charging. Such charging circuitry is capable of bi-directional charging & discharging—simply put, when add-on accessories are connected to a charging connector or placed on a charging unit (through electrical contacts or wirelessly), it also charges device platform or any other hardware coupled with add-on accessory, should a rechargeable battery not be present.

Wireless ear sets (for example, Bluetooth headsets with or without microphone) for listening to audio content transmitted from user's wireless communication device and/or device platform, may be integrated with certain embodiments of companion digital bracelets, pendants, keychain tags, bag decoration tags, earrings, etc.—as well as companion accessories may include but not limited to: one or more cameras, memory card reader/writer, loud speakers, directional microphone, plug (e.g., 3.5 mm jack for wired headset with microphone or mini-USB) for audio, data, and/or charging, and sensors (e.g., touch, proximity, audible etc.). Add-on accessories may also have an additional vibration motor and antenna integrated for stronger vibration and enhanced wireless communication signals of the coupled device platform—in some embodiments, the vibration motor and antenna may be omitted in device platforms.

In addition to fashion and new future form factors, companion fashion accessories are essentially digital peripherals that provide a user interface for the device platform and, in general, may not be able to operate independently when decoupled from device platform therewith. According to another embodiment, device platforms may be built-in and not detachable from add-on accessories.

Although many details for the hardware design in accordance with the systems and methods may not be described herein in great detail (e.g., DSP, clock battery, etc.) on the attached high level block diagram, and some functional components may be omitted here, persons of ordinary skill in the art will realize the minimum components and requirements for building a wireless computing device/computer as related to the systems and methods described herein.

FIG. 24 illustrates various views of the device platform.

In accordance with an exemplary embodiment, the device platform consists of computing components segmented into several sections; therefore each section comprises a printed circuit board (PCB) which may or may not itself be flexible and not rigid, or fully integrated chips with a sheath casing adhered to a flexible strap which enables the device platform to be bent in various directions. Straps can be made of silicone, polymer, other rubber-like or any materials that are heat-resistant and may be bent more or less. In a different embodiment, a rigid strap may be used for a particular form factor including a fixed curvature.

It should be understood that the device platform can be segmented into various numbers of sections and not restricted to the four sections illustrated herein. Furthermore, the size (length, height, width) of the device platform may also vary—any variations would be within the spirit and scope of the present application. “Section” is defined as a “Module” described above.

On one end of the module mounted strap, a connector is built-in and is linked to the circuitry of the device platform. Connectors may comprise eight, fourteen or any number of electrical contacts (pins) which are required to carry a variety of data and sustainable by the supply power. Connectors can be magnetized, plug-like, or take any other form-factor or mechanism used for easy and repeated coupling/docking. With such a connector, a large amount of functionality can be achieved.

In other embodiments, the connector may be integrated on both ends of the device platform or provided a different methods for insertion and removable of the electric contacts of the device platform, to and from receptacle electric contacts of companion accessories.

Along both sides of the device platform, the strap might consist of magnets so when it's placed near the orifice of a companion fashion accessory, the magnetized strap will snap onto or into the companion accessory. Instantly the male connector (electrical contracts) of the device platform is coupled with the receptacle (female) connector (electrical contacts) of the companion accessory, therefore data and electrical current transmission between the device platform and coupled companion accessory is now possible. It may be designed so that no tools are required for inserting or removing the device platform so that the device platform is easily interchangeable from one piece of accessory to another by the user. Connectors of the device platform and add-on accessories can be male & female, female & male, male & male, female & female, or any variation so long as they can be mated/coupled.

The flexible strap with or without the magnets on it may allow for an easy snap coupling of the device platform with the companion fashion accessories for a snug fit. In the case of

a digital bracelet or bangle, the flexible strap may also allow a concave shape for a comfortable and an uninterrupted experience when users are wearing it on their hands or body. The various modules or packages can also be connected by a ribbon cable or comparable direct solder-to-trace technique.

In addition to magnets, other methods and mechanisms may be used to secure the device platform inside or onto companion fashion accessories.

FIG. 25A exemplifies various embodiments of the systems and methods described herein. A fully functional fashion accessory, also referred to as a 'Wireless Terminal Device', requires a device platform coupling with a digital companion accessory.

For example, when the device platform is coupled with a circular open bangle, as shown in the top embodiment shown in FIG. 25A, a fully functional digital bangle is ready for use provided the bangle's internal battery is not fully discharged and connector and receptacle connectors are in contact without any obstruction.

The "same" device platform can be easily decoupled from the circular bangle (by pulling the device platform's strap away from a dimple of the inner side of companion accessory) and then insert it to the square bangle for another full function fashion accessory, as shown in the middle embodiment of FIG. 25A.

Digital bangles/bracelets can be any size, thickness, or form factor and not limited to only the square and circular open form factors shown here. The body of the bangles/bracelets can be rigid or flexible. It should also be noted that the device platform can be interchanged from one companion accessory to another so long as the companion accessories have the compatible connector and orifice—even though companion devices have different curvature surfaces. For instance, the "same" device platform that was used in the square and circular open bangles can be inserted in compatible keychain tags and bag decoration tags, for another form of full functional fashion accessory, as shown in the lower embodiment of FIG. 25A.

Such a versatile and interchangeable device platform may be an advantage for both jewelry and fashion accessory makers, as well as to consumers.

FIG. 25B illustrates the similar device platform which can be employed with smaller fashion accessories like earrings and pendants. The methods of building a smaller device platform is essentially the same as building the device platform shown and used in FIG. 3A.

One "small" device platform can be incorporated and used in numerous digital fashion accessories. For example, the 'same' small device platform can be used, for example, on a necklet, pendant A and pendant B—and can also be adapted to ear ring A, B, and C, as illustrated.

The "same" smaller device platform can also be incorporated to endless add-on accessories, so long as the add-on accessories provide a compatible connector and/or orifice for the smaller device platform to be inserted/housed—regardless of the form factor, design style, with or without display, type of fashion accessories, etc.

All pendants and earrings house a retractable ear set and when coupled with the small device platform, they transform to fully functional wireless headsets—yet still look like elegantly designed fashion jewelry or accessory. In some embodiments, pendants may be designed for use with a wired headset with or without wireless head set integrated.

The methods and systems for developing device platforms for digital bracelets and hand bag decoration tags can also be employed to earrings, pendants and other fashion accessories with smaller device platforms. Such smaller device platform

may or may not be equipped with reduced functionality. For instance, digital accessories such as earrings and certain pendants do not have a display; therefore a video processor may or may not be built in on such small device platforms.

FIG. 26 is a simplified flow chart illustration of the functional operation of the device platform when coupled with an add-on accessory in accordance with an embodiment. When both of these apparatuses are coupled, they become a fully functional wireless terminal device.

To use the wireless terminal device, users need:

10401) To couple the device platform with the desired add-on accessory whether it be a square bangle, oval bracelet, pendant, handbag decoration tag, etc.

10402) After both the device platform is coupled with an add-on accessory, now power from one or more built-in battery of the add-on accessory supplies and powers the device platform.

10403) User now can turn on the wireless terminal device (either by pushing a button or via other means such as voice command or touch/motion sensor on add-on accessory or directly on device platform).

10404) Data now can be transmitted to and from the device platform and add-on accessory through the same coupled connectors that transmit power currents, the device platform obtains add-on accessory identifiers.

10405) The device platform determines whether coupled add-on accessory is authentic. If NO (authentication fails) pairing occurs, then the operation is aborted (**10407**) and the wireless terminal device can be made non-functional. If YES (authentication passes), Device platform obtains information (**10406**) about coupled add-on accessory (such as component drivers like speaker(s), microphone, proximity and other sensors, together with display type & size, number of displays, etc. if present)

10408) Device platform then determines which characteristics and what functionality can be used with a particular coupled add-on accessory based on information obtained during prior steps.

10409) Now the add-on accessory is authenticated and the wireless terminal device is fully functional and ready to use.

User can access and control the wireless terminal device via the touch screen interface or through other touch mechanism. Furthermore, user also can use voice commands to call for certain actions.

Should users need to recharge the internal rechargeable battery of any add-on accessory, users can attached it with compatible charging adapter or place it on a wireless charging platform—with or without the device platform actually coupled.

FIGS. 27A and 27B show link relationships between wireless terminal device, wireless headset, and wireless telephone. Wireless terminal device is when an add-on accessory is coupled with a device platform and transformed into a fully functional but specifically featured hardware device.

FIG. 27A illustrates potential communication links between wireless telephone, wireless terminal devices (add-on accessory device platform), and wireless headset where wireless terminal device is the central hub. The wireless telephone can transmit data to and from the wireless terminal device—in turn the wireless terminal device can also wirelessly communicate with integrated or 3rd party wireless headset (e.g., Bluetooth headsets). User may use a wireless headset to control and access certain functions of the wireless telephone via a wireless terminal device. For instance, user could activate or end a phone call by pushing a button on the

35

wireless headset or speaking a command. Furthermore, user could select certain applications directly from the wireless headset.

FIG. 27B shows link connections between wireless telephone, wireless terminal device (add-on accessory device platform), and wireless headset where wireless telephone is the central hub. Wireless telephone can transmit data to and from wireless terminal device- and simultaneously communicates with wireless headsets.

In this configuration, users may utilize the wireless headset with the wireless telephone, with or without the presence of a wireless terminal device.

It should be noted that the configuration shown on FIG. 27A may be easily reconfigured to FIG. 27B and vice versa. This can be done by pairing the wireless headset either directly with the wireless telephone or wireless terminal device.

While embodiments of communication links are wireless signals, wired and physical connections may be employed in other embodiments. Furthermore, a wireless terminal device may be equipped with a cellular receiver, Wi-Fi or other wireless interfaces to communicate directly with the cellular, Wi-Fi or other wireless networks with or without the presence of a wireless telephone.

FIG. 28A-30 illustrates various alternative designs and embodiments of the present design in a bracelet/bangle form factor.

FIG. 28A illustrates a straight view of a square bangle 10605 with integrated removable wireless ear set 10615 detached (with retractable ear bud 10620 ejected) while a device platform 10610 about to be inserted into the add-on accessory (square bangle) 10605.

FIG. 28B shows a perspective view of the same square bangle with the wireless ear set coupled to the bangle. Moreover, this drawing also exemplifies a user-interface on one of the four displays (top screen 10625) while the other display (front screen 10630) shows an illustrative Louis Vuitton pattern used as a wallpaper.

In accordance with an embodiment, an oval form factor of the bangle 10705 without integrated wireless ear set is shown on FIG. 29 while another circular but open bangle 10805 with a smaller form factor wireless ear set 10810 illustrates another embodiment shown on FIG. 30.

It should be understood that companion accessories can be of any form factor, any size, built with any materials, and can have different shapes and curvatures—while digital bangles can be open or close, square or round, etc. But all variations may be coupled with the same device platform whereas its flexible strap allows the adaptive characteristics. Therefore such a device platform not only can be coupled and used with bracelets/bangles, it can be removed, coupled and used with keychain tags, bag decoration tags, certain pendants, and other compatible companion accessories.

In so far as the description above and the accompanying drawings disclose any additional subject matter that is not within the scope of the single claim below, the inventions are not dedicated to the public and the right to file one or more applications to claim such additional inventions is reserved.

Although a very narrow claim is presented herein, it should be recognized that the scope of this application is much broader than presented by the single claim. It is intended that broader claims will be submitted in one or more future or continuation applications that claim the benefit of priority from this application.

The present application has been described with reference to certain preferred and alternative embodiments that are

36

intended to be exemplary only and not limiting to the full scope of the present application.

I claim:

1. A wearable communication device comprising: a bracelet comprising an integrated first power source; a telecommunications device comprising a transceiver configured to allow wireless communication, wherein the telecommunications device is configured to couple and decouple with the bracelet, and wherein the telecommunications device is configured receive power from the first power source when coupled with the bracelet; wherein the integrated power source comprises at least one battery disposed within a portion of the bracelet; and wherein the at least one battery comprises a series of round batteries strung together by a wire and disposed within a portion the bracelet.
2. The wearable communication device of claim 1, wherein the telecommunications device further comprises a second power source, wherein the telecommunications device is configured to receive power from the second power source when the telecommunications device is decoupled from the bracelet, and wherein the telecommunications device is configured to charge the second power source using the first power source when the telecommunications device is coupled to the bracelet.
3. The wearable communication device of claim 1, wherein the transceiver of the telecommunications device comprises a cellular chip configured to communicate with a cellular network.
4. The wearable communication device of claim 1, wherein the transceiver of the telecommunications device comprises a Bluetooth chip configured to communicate with another Bluetooth device.
5. The wearable communication device of claim 4, wherein the Bluetooth device is a cellular communications device and wherein Bluetooth chip is configured to interface with the mobile communications device to communicate with a cellular network.
6. The wearable communication device of claim 1, wherein at least one of the bracelet and the telecommunications device comprises a display screen.
7. The wearable communication device of claim 6, wherein the bracelet further comprises a display screen formed on a surface of the bracelet.
8. The wearable communication device of claim 7, wherein the bracelet comprises a plurality of display screens formed on a plurality of surfaces of the bracelet.
9. The wearable communication device of claim 7, wherein the display screen is a touch screen configured to receive user input.
10. The wearable communication device of claim 6, wherein the display screen is a touch screen configured to receive user input.
11. The wearable communication device of claim 1, wherein at least one of the bracelet and the telecommunications device includes at least one earphone.
12. The communications device of claim 11, wherein the telecommunications device comprises at least one earphone.
13. The communications device of claim 12, wherein the at least one earphone is configured to be retractable into a cavity formed on the telecommunications device.
14. The communications device of claim 13, wherein the at least one earphone comprises a spring member configured to

extend the at least one earphone from the cavity when a release mechanism on the telecommunications device is activated.

15. The wearable communication device of claim 11, wherein the at least one earphone is configured to be retractable into a cavity.

16. The wearable communication device of claim 15, wherein the at least one earphone comprises a spring member configured to extend the at least one earphone from the cavity when a release mechanism is activated.

17. The wearable communication device of claim 1, wherein the at least one battery has at least one of a square shape, a rectangular shape, a circular shape, and an oval shape.

18. The wearable communication device of claim 1, wherein the at least one battery comprises a plurality of batteries shaped and sized to fit within the bracelet.

19. The wearable communication device of claim 1, wherein the bracelet comprises a receptacle connector configured to receive and couple with the telecommunications device.

20. The wearable communication device of claim 19, wherein receptacle connector is formed on a side of the bracelet, and

wherein the telecommunications device is configured to be inserted into the receptacle connector.

21. The wearable communication device of claim 1, wherein the bracelet is formed with a gap forming a discontinuity along the length of the bracelet; and

wherein the telecommunications device is configured to fit into the gap in the bracelet and close the discontinuity along the length of the bracelet.

22. The wearable communication device of claim 20, wherein a first connector is formed on a portion of the bracelet proximate to the gap; and

wherein a second connector is formed on the telecommunications device, and the second connector is formed to interface with the first connector when the telecommunications device is inserted into the gap in the bracelet.

23. The wearable communications device of claim 1, further comprises a connector configured to couple and decouple the telecommunications device to the bracelet.

24. The wearable communications device of claim 23, wherein the connector is configured to transmit power from the first power source to the telecommunications device when coupled to the bracelet.

25. The wearable communications device of claim 23, wherein the connector is configured to transmit signals between the bracelet and the telecommunications device.

26. The wearable communications device of claim 1, further comprising a charging member configured to connect to at least one of the bracelet and the telecommunications device and charge the first power source.

27. The wearable communications device of claim 26, wherein the charging member is configured to connect between the telecommunications device and the bracelet.

28. The wearable communications device of claim 26, wherein the charging member is configured to connect to a wall socket to charge the first power source.

29. The wearable communications device of claim 1, wherein the telecommunications device comprises at least one a modular platform configured to conform to a curvature of the bracelet.

30. The wearable communications device of claim 1, further comprising a plurality of wearable accessories including the bracelet, each of the plurality of wearable accessories having a first power source; and

wherein the telecommunications device is configured to selectably be coupled and decoupled with any one of the plurality of wearable accessories including the bracelet interchangeably.

31. A wearable communication device comprising:
 a bracelet comprising an integrated first power source;
 a telecommunications device comprising a transceiver configured to allow wireless communication,
 wherein the telecommunications device is configured to couple and decouple with the bracelet, and
 wherein the telecommunications device is configured to receive power from the first power source when coupled with the bracelet;
 wherein the integrated power source comprises at least one battery disposed within a portion of the bracelet;
 wherein bracelet comprises at least one gem, wherein the at least one battery is sized and shaped to be housed within the at least one gem.
