## FIELD OF THE INVENTION

The present invention relates to novel and inventive parasiticidal and pesticidal isoxazoline compounds of formula (I):

wherein, D<sup>1</sup>, D<sup>2</sup>, D<sup>3</sup>, D<sup>4</sup>, D<sup>5</sup>, B<sup>1</sup>, B<sup>2</sup>, B<sup>3</sup>, R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup>, R<sup>5</sup>, R<sup>6</sup>, Y, Z, L, a and b are as defined below, and compositions comprising at least one compound of formula (I) in combination with a pharmaceutically acceptable or agriculturally acceptable carrier. The invention also relates to uses of the compounds and methods comprising the compounds for the treatment and prevention of parasitic infections or infestations and for controlling pests in crops, plants, plant propagation material and material derived from wood.

## BACKGROUND OF THE INVENTION

Animals such as mammals and birds are often susceptible to parasite infestations/infections. These parasites may be ectoparasites, such as insects, and endoparasites such as nematodes and other worms. Domesticated animals, such as cats and dogs, are often infested with one or more of the following ectoparasites:

fleas (e.g. *Ctenocephalides* spp., such as *Ctenocephalides felis* and the like);

ticks (e.g. *Rhipicephalus* spp., *Ixodes* spp., *Dermacentor* spp., *Amblyoma* spp., and the like);

mites (e.g. *Demodex* spp., *Sarcoptes* spp., *Otodectes* spp., and the like);

## 2

lice (e.g. *Trichodectes* spp., *Cheyletiella* spp., *Linognathus* spp. and the like);

mosquitoes (*Aedes* spp., *Culex* spp., *Anopheles* spp. and the like); and

flies (*Hematobia* spp., *Musca* spp., *Stomoxys* spp., *Dermatobia* spp., *Cochliomyia* spp. and the like).

Fleas are a particular problem because not only do they adversely affect the health of the animal or human, but they also cause a great deal of psychological stress. Moreover, fleas may also transmit pathogenic agents to animals and humans, such as tapeworm (*Dipylidium caninum*).

Similarly, ticks are also harmful to the physical and psychological health of the animal or human. However, the most serious problem associated with ticks is that they are vectors of pathogenic agents in both humans and animals. Major diseases which may be transmitted by ticks include borrelioses (Lyme disease caused by *Borrelia burgdorferi*), babesiosis (or piroplasmoses caused by *Babesia* spp.) and rickettsioses (e.g. Rocky Mountain spotted fever). Ticks also release toxins which cause inflammation or paralysis in the host. Occasionally, these toxins are fatal to the host.

Likewise, farm animals are also susceptible to parasite infestations. For example, a parasite which is prevalent among cattle in some regions are ticks of the genus *Rhipicephalus*, especially those of the species *microplus* (cattle tick), *decoloratus* and *annulatus*. Ticks such as *Rhipicephalus microplus* (formerly *Boophilus microplus*) are difficult to control because they lay eggs in the pasture where farm animals graze. This species of ticks is considered a one-host tick and spends immature and adult stages on one animal before the female engorges and falls off the host to lay eggs in the environment. The life cycle of the tick is approximately three to four weeks. In addition to cattle, *Rhipicephalus microplus* may infest buffalo, horses, donkeys, goats, sheep, deer, pigs, and dogs. A heavy tick burden on animals can decrease production and damage hides as well as transmit diseases such as babesiosis (“cattle fever”) and anaplasmosis.

Animals and humans also suffer from endoparasitic infections including, for example, helminthiasis which is caused by of parasitic worms categorized as cestodes (tapeworm), nematodes (roundworm) and trematodes (flatworm or flukes). These parasites adversely affect the nutrition of the animal and cause severe economic losses in pigs, sheep, horses, and cattle as well as affecting companion animals and poultry. Other parasites which occur in the gastrointestinal tract of animals and humans include *Ancylostoma*, *Necator*, *Ascaris*, *Strongyloides*, *Trichinella*, *Capillaria*, *Toxocara*, *Toxascaris*, *Trichuris*, *Enterobius* and parasites which are found in the blood or other tissues and organs such as filarial worms and the extra intestinal stages of *Stroglyloides*, *Toxocara* and *Trichinella*. Various patent publications have described isoxazoline derivatives having pesticidal properties, compositions comprising these compounds and use of the compounds in the fields of agriculture and veterinary medicine.

#### Stereoisomers and Polymorphic Forms

It will be appreciated by those of skill in the art that the compounds of the invention may exist and be isolated as optically active and racemic forms. Compounds having one or more chiral centers, including that at a sulfur atom, may be present as single enantiomers or diastereomers or as mixtures of enantiomers and/or diastereomers. For example, it is well known in the art that sulfoxide compounds may be optically active and may exist as single enantiomers or racemic mixtures. In addition, compounds of the invention may include one or more chiral centers, which results in a theoretical number of optically active isomers. Where compounds of the invention include  $n$  chiral centers, the compounds may comprise up to  $2^n$  optical isomers. The present invention encompasses the specific enantiomers or diastereomers of each compound as well as mixtures of different enantiomers and/or diastereomers of the compounds of the invention that possess the useful properties described herein. The optically active forms can be prepared by, for example, resolution of the racemic forms by selective crystallization techniques, by synthesis from optically active precursors, by chiral synthesis, by chromatographic separation using a chiral stationary phase or by enzymatic resolution.

The compounds of present invention may also be present in different solid forms such as different crystalline forms or in the form of an amorphous solid. The present invention encompasses different crystalline forms as well as amorphous forms of the inventive compounds.

In addition, the compounds of the invention may exist as hydrates or solvates, in which a certain stoichiometric amount of water or a solvent is associated with the molecule in the crystalline form. The hydrates and solvates of the compounds of formula (I), (IA), (IB), (IC), (ID) and (IE) are also the subject of the invention.

#### Salts

In addition to the neutral compounds of formula (I), salt forms of the compounds are also active against animal pests. The terms "veterinarily acceptable salt" and "agriculturally acceptable salt" are used throughout the specification to describe any salts of the compounds that are acceptable for administration for veterinary and agricultural applications, and which provides the active compound upon administration.

In cases where compounds are sufficiently basic or acidic to form stable non-toxic acid or base salts, the compounds may be in the form of a veterinarily or agriculturally acceptable salt. Veterinarily or agriculturally acceptable salts include those derived from veterinarily or agriculturally acceptable inorganic or organic bases and acids. Suitable salts include those comprising alkali metals such as lithium, sodium or potassium, alkaline earth metals such as calcium, magnesium and barium. Salts comprising transition metals including, but not limited to, manganese, copper, zinc and iron are also suitable. In addition, salts comprising ammonium cations ( $\text{NH}_4^+$ ) as well as substituted ammonium cations, in which one or more of the hydrogen atoms are replaced by alkyl or aryl groups are encompassed by the invention.

Salts derived from inorganic acids including, but not limited to, hydrohalide acids (HCl, HBr, HF, HI), sulfuric acid, nitric acid, phosphoric acid, and the like are particularly suitable. Suitable inorganic salts also include, but not limited to, bicarbonate, and carbonate salts. In some embodiments, examples of veterinarily and agriculturally acceptable salts are organic acid addition salts formed with organic acids including, but not limited to, maleate, dimaleate, fumarate, tosylate, methanesulfonate, acetate, citrate, malonate, tartarate, succinate, benzoate, ascorbate,  $\alpha$ -ketoglutarate, and  $\alpha$ -glycerophosphate. Of course, other acceptable organic acids may be used.

Alkali metal (for example, sodium, potassium or lithium) or alkaline earth metal (for example calcium) salts of the compounds can also be made by reacting a sufficiently acidic residue on the compounds with a hydroxide of the alkali metal or alkaline earth metal.

Veterinarily and agriculturally acceptable salts may be obtained using standard procedures well known in the art, for example by reacting a sufficiently basic compound such as an amine with a suitably acid functional group present in the compound, or by reacting a suitable acid with a suitably basic functional group on the compound of the invention.

#### Synthesis of Compounds

The isoxazoline compounds of formula (I), (IA), (IB), (IC), (ID) or (IE) may be prepared by processes described herein or by adaptation of these processes or process known in the art to prepare compounds with different substitution patterns. For example, the compounds of the invention may be prepared by adaptation of processes described in U.S. Pat. Nos. 7,951,828; 7,662,971; 7,662,972; 8,389,738; 8,217,180; 8,513,431 and U.S. Patent Publication No. 2010/0137612 (all incorporated herein by reference). Scheme 1 below describes one embodiment of the synthesis of certain compounds of the invention of formula (I), wherein A<sup>1</sup>, A<sup>2</sup>, A<sup>3</sup>, R<sup>1</sup>, B<sup>1</sup>, B<sup>2</sup>, B<sup>3</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup>, R<sup>5</sup>, R<sup>6</sup>, R<sup>8</sup>, L, Y, a and b are as described above, from carboxylic acid 1-1.

The preparation of carboxylic acid 1-1 has been described previously in, for example, U.S. Pat. Nos. 7,951,828; 7,662,971; 7,662,972; 8,389,738; 8,217,180; 8,513,431 and U.S. Patent Publication No. 2010/0137612. Thus, carboxylic acid 1-1 is activated by addition of an appropriate activating agent such as a known peptide coupling agent including, but not limited to, a carbodiimide coupling agent, a phosphonium or uronium coupling agents and the like, to generate an activated acyl group, followed by reaction with compound 1-2 to provide the desired compound 1-3. A general description of this transformation is described in *March's Advanced Organic Chemistry—Reactions, Mechanisms and Structure* (6<sup>th</sup> Edition), ed. Michael B. Smith and Jerry March, Wiley Interscience (John Wiley & Sons, Inc.), page 1430-1434

85

(16-74—Acylation of Amines by Carboxylic Acids—Amino-de-hydroxylation), (2007). In another embodiment, the carboxylic acid 1-1 may be first converted to a reactive acyl halide compound or activated ester compound that is then reacted with compound 1-2 to form compound 1-3. 5 Activated ester compounds include esters of phenols containing one or more electronic withdrawing groups on the phenyl ring such as nitro, fluoro, chloro, and the like. Other active esters include succinimido esters (see for example, Amino Acid and Peptide Synthesis, second edition, by John Jones; Oxford University Press, 2002).

In another embodiment of the invention, certain compounds of the invention of formula (I), wherein  $A^1$ ,  $A^2$ ,  $A^3$ ,  $R^1$ ,  $B^1$ ,  $B^2$ ,  $B^3$ ,  $R^2$ ,  $R^3$ ,  $R^4$ ,  $R^5$ ,  $R^6$ ,  $R^8$ ,  $L$ ,  $Y$ ,  $a$  and  $b$  are as described above, are prepared from carboxylic acid 1-1 15 according to the method shown in scheme 2 below.

In the embodiment shown in scheme 2, the carboxylic acid 1-1 is reacted with an unprotected ( $P=H$ ) or nitrogen-protected compound 2-2 in the presence of a coupling agent. If compound 2-2 is protected with a nitrogen protecting group, the protecting group is removed to form compound 2-3. Compound 2-3 is then reacted with the group  $LG-Y$  to form the desired compound. Alternatively, the carboxylic acid 1-1 is first converted to an acyl halide or active ester and then reacted with compound 2-2 to form compound 2-3, which is then reacted further to form compound 1-3. 60

The invention further contemplates separating the enantiomers in whole or in part of the present invention or synthesizing enantiomerically enriched compounds of the invention. The composition may be prepared by separating the enantiomers in whole or in part by standard methods, for example by chemical resolution using optically active acid 65

86

or by use of column chromatography or reverse-phase column chromatography using a substantially optically active (or "chiral") stationary phase as known to those skilled in the art. The formation and/or isolation of specific enantiomers of a compound is not routine, and there are no general methods that may be used to obtain specific enantiomers of all compounds. The methods and conditions used to obtain specific enantiomers of a compound must be determined for each specific compound. Enantiomerically enriched compounds of the invention can also be obtained from enantiomerically enriched precursors.

#### Veterinary Compositions

Another aspect of the invention is the formation of parasitocidal compositions which comprise the isoxazoline compounds of the invention. The composition of the invention can also be in a variety of forms which include, but are

not limited to, oral formulations, injectable formulations, and topical, dermal or subdermal formulations. The formulations are intended to be administered to an animal which includes but is not limited to mammals, birds and fish. Examples of mammals include but are not limited to humans, cattle, sheep, goats, llamas, alpacas, pigs, horses, donkeys, dogs, cats and other livestock or domestic mammals. Examples of birds include turkeys, chickens, ostriches and other livestock or domestic birds.

The composition of the invention may be in a form suitable for oral use, for example, as baits (see, e.g., U.S. Pat. No. 4,564,631, incorporated herein by reference), dietary supplements, troches, lozenges, chewables, tablets, hard or soft capsules, emulsions, aqueous or oily suspensions, aqueous or oily solutions, oral drench formulations, dispersible powders or granules, premixes, syrups or elixirs, enteric

formulations or pastes. Compositions intended for oral use may be prepared according to any method known in the art for the manufacture of pharmaceutical compositions and such compositions may contain one or more agents selected from the group consisting of sweetening agents, bittering agents, flavoring agents, coloring agents and preserving agents in order to provide pharmaceutically elegant and palatable preparations.

Tablets or chewable dosage forms may contain the active ingredient in admixture with non-toxic, pharmaceutically acceptable excipients which are suitable for the manufacture of tablets. These excipients may be, for example, inert diluents, such as calcium carbonate, sodium carbonate, lactose, calcium phosphate or sodium phosphate; granulating and disintegrating agents, for example, corn starch, or alginic acid; binding agents, for example starch, gelatin or acacia, and lubricating agents, for example, magnesium stearate, stearic acid or talc, the tablets may be uncoated or they may be coated by known techniques to delay disintegration and absorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or glyceryl distearate may be employed. They may also be coated by the technique described in U.S. Pat. Nos. 4,256,108; 4,166,452; and 4,265,874 (incorporated herein by reference) to form osmotic therapeutic tablets for controlled release.

Formulations for oral use may be hard gelatin capsules, wherein the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin. Capsules may also be soft gelatin capsules, wherein the active ingredient is mixed with water or miscible solvents such as propylene glycol, polyethylene glycols (PEGs) and ethanol, or an oil medium, for example peanut oil, liquid paraffin, or olive oil.

The compositions of the invention may also be in the form of oil-in-water or water-in-oil emulsions. The oily phase may be a vegetable oil, for example, olive oil or arachis oil, or a mineral oil, for example, liquid paraffin or mixtures of these. Suitable emulsifying agents may be naturally-occurring phosphatides, for example, soybean, lecithin, and esters or partial esters derived from fatty acids and hexitol anhydrides, for example, sorbitan monooleate, and condensation products of the said partial esters with ethylene oxide, for example, polyoxyethylene sorbitan monooleate. The emulsions may also contain sweetening agents, bittering agents, flavoring agents, and/or preservatives.

In one embodiment of the formulation, the composition of the invention is in the form of a microemulsion. Microemulsions are well suited as the liquid carrier vehicle. Microemulsions are quaternary systems comprising an aqueous phase, an oily phase, a surfactant and a cosurfactant. They are translucent and isotropic liquids.

Microemulsions are composed of stable dispersions of microdroplets of the aqueous phase in the oily phase or conversely of microdroplets of the oily phase in the aqueous phase. The size of these microdroplets is less than 200 nm (1000 to 100,000 nm for emulsions). The interfacial film is composed of an alternation of surface-active (SA) and co-surface-active (Co-SA) molecules which, by lowering the interfacial tension, allows the microemulsion to be formed spontaneously.

In one embodiment of the oily phase, the oily phase can be formed from mineral or vegetable oils, from unsaturated polyglycosylated glycerides or from triglycerides, or alternatively from mixtures of such compounds. In one embodiment of the oily phase, the oily phase comprises of triglyc-

erides; in another embodiment of the oily phase, the triglycerides are medium-chain triglycerides, for example C<sub>8</sub>-C<sub>10</sub> caprylic/capric triglyceride. In another embodiment of the oily phase will represent a % v/v range selected from the group consisting of about 2 to about 15%; about 7 to about 10%; and about 8 to about 9% v/v of the microemulsion.

The aqueous phase includes, for example water or glycol derivatives, such as propylene glycol, glycol ethers, polyethylene glycols or glycerol. In one embodiment of the glycol derivatives, the glycol is selected from the group consisting of propylene glycol, diethylene glycol monoethyl ether, dipropylene glycol monoethyl ether and mixtures thereof. Generally, the aqueous phase will represent a proportion from about 1 to about 4% v/v in the microemulsion.

Surfactants for the microemulsion include diethylene glycol monoethyl ether, dipropylene glycol monomethyl ether, polyglycolized C<sub>8</sub>-C<sub>10</sub> glycerides or polyglyceryl-6 dioleate. In addition to these surfactants, the cosurfactants include short-chain alcohols, such as ethanol and propanol.

Some compounds are common to the three components discussed above, i.e., aqueous phase, surfactant and cosurfactant. However, it is well within the skill level of the practitioner to use different compounds for each component of the same formulation. In one embodiment for the amount of surfactant/cosurfactant, the cosurfactant to surfactant ratio will be from about 1/7 to about 1/2. In another embodiment for the amount of cosurfactant, there will be from about 25 to about 75% v/v of surfactant and from about 10 to about 55% v/v of cosurfactant in the microemulsion.

Oily suspensions may be formulated by suspending the active ingredient in a vegetable oil, for example, atachis oil, olive oil, sesame oil or coconut oil, or in mineral oil such as liquid paraffin. The oily suspensions may contain a thickening agent, for example, beeswax, hard paraffin or cetyl alcohol. Sweetening agents such as sucrose, saccharin or aspartame, bittering agents, and flavoring agents may be added to provide a palatable oral preparation. These compositions may be preserved by the addition of an antioxidant such as ascorbic acid, or other known preservatives.

Aqueous suspensions may contain the active material in admixture with excipients suitable for the manufacture of aqueous suspensions. Such excipients are suspending agents, for example, sodium carboxymethylcellulose, methylcellulose, hydroxy-propylmethylcellulose, sodium alginate, polyvinylpyrrolidone, gum tragacanth and gum acacia; dispersing or wetting agents may be a naturally-occurring phosphatide, for example lecithin, or condensation products of an alkylene oxide with fatty acids, for example polyoxyethylene stearate, or condensation products of ethylene oxide with long chain aliphatic alcohols, for example, heptadecaethyleneoxycetanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or condensation products of ethylene oxide, with partial esters derived from fatty acids and hexitol anhydrides, for example polyethylene sorbitan monooleate. The aqueous suspensions may also contain one or more preservatives, for example ethyl, or n-propyl, p-hydroxybenzoate, one or more coloring agents, one or more flavoring agents, and one or more sweetening agents and/or bittering agents, such as those set forth above.

Dispersible powders and granules suitable for preparation of an aqueous suspension by the addition of water provide the active ingredient in admixture with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents and suspending

agents are exemplified by those already mentioned above. Additional excipients, for example, sweetening, bittering, flavoring and coloring agents, may also be present.

Syrups and elixirs may be formulated with sweetening agents, for example, glycerol, propylene glycol, sorbitol or sucrose. Such formulations may also contain a demulcent, a preservative, flavoring agent(s) and/or coloring agent(s).

In another embodiment of the invention, the composition can be in paste form. Examples of embodiments in a paste form include but are not limited to those described in U.S. Pat. Nos. 6,787,342 and 7,001,889 (each of which are incorporated herein by reference). In addition to the isoxazoline compound of the invention, the paste can also contain fumed silica; a viscosity modifier; a carrier; optionally, an absorbent; and optionally, a colorant, stabilizer, surfactant, or preservative.

The process for preparing a paste formulation comprises the steps of:

- (a) dissolving or dispersing the isoxazoline compound into the carrier by mixing;
- (b) adding the fumed silica to the carrier containing the dissolved isoxazoline compound and mixing until the silica is dispersed in the carrier;
- (c) allowing the intermediate formed in (b) to settle for a time sufficient in order to allow the air entrapped during step (b) to escape; and
- (d) adding the viscosity modifier to the intermediate with mixing to produce a uniform paste.

The above steps are illustrative, but not limiting. For example, step (a) can be the last step.

In one embodiment of the formulation, the formulation is a paste containing isoxazoline compound, fumed silica, a viscosity modifier, an absorbent, a colorant; and a hydrophilic carrier which is triacetin, a monoglyceride, a diglyceride, or a triglyceride.

The paste may also include, but is not limited to, a viscosity modifier including PEG 200, PEG 300, PEG 400, PEG 600, monoethanolamine, triethanolamine, glycerol, propylene glycol, polyoxyethylene (20) sorbitan monooleate (POLYSORBATE 80 or TWEEN 80), and poloxomers (e.g., PLURONIC L 81); an absorbent including magnesium carbonate, calcium carbonate, starch, and cellulose and its derivatives; and a colorant selected from the group consisting of titanium dioxide iron oxide, and FD&C Blue #1 ALUMINUM LAKE.

The compositions may be in the form of a sterile injectable aqueous or oleagenous suspension or an injectable solution. This suspension may be formulated according to the known art using those suitable dispersing or wetting agents and suspending agents which have been mentioned above. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example, as a solution in 1,3-butane diol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution. Cosolvents such as ethanol, propylene glycol glycerol formal or polyethylene glycols may also be used. Preservatives, such as phenol or benzyl alcohol, may be used.

In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of injectables.

Topical, dermal and subdermal formulations can include emulsions, creams, ointments, gels, pastes, powders, shampoos, pour-on formulations, spot-on solutions and suspen-

sions, dips and sprays. Topical application of an inventive compound or of a composition including at least one inventive compound among active agent(s) therein, in the form of a spot-on or pour-on composition, can allow for the inventive compound to be absorbed through the skin to achieve systemic levels, distributed through the sebaceous glands or on the surface of the skin achieving levels throughout the haircoat. When the compound is distributed through the sebaceous glands, they can act as a reservoir, whereby there can be a long-lasting effect (up to several months) effect. Spot-on formulations are typically applied in a localized region which refers to a relatively small area on the animal rather than to a large portion of the surface of the animal. In one embodiment of a localized region, the location is between the shoulders. In another embodiment of a localized region it is a stripe, e.g. a stripe from head to tail of the animal.

Pour-on formulations are described in U.S. Pat. No. 6,010,710, incorporated herein by reference. In some embodiments, the pour-on formulations may be oily, and generally comprise a diluent or vehicle and also a solvent (e.g. an organic solvent) for the active ingredient if the latter is not soluble in the diluent. In other embodiments, the pour-on formulations may be non-oily, including alcohol-based formulations.

In other embodiments, the crystallization inhibitor may be present in a proportion of about 1 to about 20% (w/v) and about 5 to about 15%. Acceptable inhibitors are those whose addition to the formulation inhibits the formation of crystals when the formulation is applied. In other embodiments, the volume applied may be about 5 ml to about 10 ml, about 5 ml to about 15 ml, about 10 ml to about 20 ml, or about 20 ml to about 30 ml, depending on the size of the animal treated and the concentration of the active agent in the formulation, among other factors.

In another embodiment of the invention, application of a spot-on formulation according to the present invention can also provide long-lasting and broad-spectrum efficacy when the solution is applied to the mammal or bird. The spot-on formulations provide for topical administration of a concentrated solution, suspension, microemulsion or emulsion for intermittent application to a spot on the animal, generally between the two shoulders (solution of spot-on type).

#### Agricultural Compositions

The compounds of formula (I), (IA), (IB), (IC), (ID) and (IE) can be formulated in various ways, depending on the prevailing biological and/or chemico-physical parameters. Examples of possible formulations which are suitable are: wetttable powders (WP), water-soluble powders (SP), water-soluble concentrates, emulsifiable concentrates (EC), emulsions (EW) such as oil-in-water and water-in-oil emulsions, sprayable solutions, suspension concentrates (SC), dispersions on an oil or water basis, solutions which are miscible with oil, capsule suspensions (CS), dusts (DP), seed-dressing products, granules for broadcasting and soil application, granules (GR) in the form of microgranules, spray granules, coated granules and adsorption granules, water-dispersible granules (WG), water-soluble granules (SG), ULV formulations, microcapsules and waxes.

Solid state forms of the compounds of formula (I) can be prepared by methods known in the art, e.g. Byrn et al., "Solid-State Chemistry of Drugs", 2<sup>nd</sup> Edition, SSCI Inc., (1999); Glusker et al., "Crystal Structure Analysis—A Primer", 2<sup>nd</sup> Edition, Oxford University Press, (1985).

The formulations mentioned can be prepared in a manner known per se, for example by mixing the active compounds with at least one solvent or diluent, emulsifier, dispersant and/or binder or fixative, water repellent and optionally one or more of a desiccant, UV stabilizer, a colorant, a pigment and other processing auxiliaries.

These individual formulation types are known in principle and described, for example, in: Winnacker-Küchler, "Chemische Technologie" [Chemical Technology], Volume 7, C. Hauser Verlag, Munich, 4th Edition 1986; Wade van Valkenburg, "Pesticide Formulations", Marcel Dekker, N.Y., 1973; K. Martens, "Spray Drying Handbook", 3rd Ed. 1979, G. Goodwin Ltd. London.

The necessary formulation auxiliaries such as inert materials, surfactants, solvents and other additives are also

known and described, for example, in: Watkins, "Handbook of Insecticide Dust Diluents and Carriers", 2nd Ed., Darland Books, Caldwell N.J.; H. v. Olphen, "Introduction to Clay Colloid Chemistry", 2nd Ed., J. Wiley & Sons, N.Y.; C. Marsden, "Solvents Guide", 2nd Ed., Interscience, N.Y. 1963; McCutcheon's "Detergents and Emulsifiers Annual", MC Publ. Corp., Ridgewood N.J.; Sisley and Wood, "Encyclopedia of Surface Active Agents", Chem. Publ. Co. Inc., N.Y. 1964; Schönfeldt, "Grenzflächenaktive Äthylenoxidaddukte" [Surface-active ethylene oxide adducts], Wiss. Verlagsgesell, Stuttgart 1976; Winnacker-Küchler, "Chemische Technologie" [Chemical Technology], Volume 7, C. Hauser Verlag, Munich, 4th Ed. 1986.

Wetttable powders are preparations which are uniformly dispersible in water and which, besides the compounds of formula (I), also comprise ionic and/or nonionic surfactants (wettters, dispersants), for example, polyoxyethylated alkylphenols, polyoxyethylated fatty alcohols, polyoxyethylated fatty amines, fatty alcohol polyglycol ether sulfates, alkane-sulfonates or alkylbenzenesulfonates, sodium lignosulfonate, sodium 2,2'-dinaphthylmethane-6,6'-disulfonate, sodium dibutyl-naphthalenesulfonate or else sodium oleoyl-methyltaurinate, in addition to a diluent or inert substance. To prepare the wetttable powders, the compounds of formula (I) are, for example, ground finely in conventional apparatuses such as hammer mills, blower mills and air-jet mills and mixed with the formulation auxiliaries, either concomitantly or thereafter.

Emulsifiable concentrates are prepared, for example, by dissolving the compounds of formula (I) in an organic solvent, for example butanol, cyclohexanone, dimethylformamide, xylene or else higher-boiling aromatics or hydrocarbons or mixtures of these, with addition of one or more ionic and/or nonionic surfactants (emulsifiers). Emulsifiers which can be used are, for example: calcium salts of alkylarylsulfonic acids, such as calcium dodecylbenzenesulfonate or nonionic emulsifiers, such as fatty acid polyglycol esters, alkylaryl polyglycol ethers, fatty alcohol polyglycol ethers, propylene oxide/ethylene oxide condensates, alkyl polyethers, sorbitan esters such as sorbitan fatty acid esters or polyoxyethylene sorbitan esters such as polyoxyethylene sorbitan fatty acid esters.

Dusts are obtained by grinding the active substance with finely divided solid substances, for example talc or natural clays, such as kaolin, bentonite or pyrophyllite, or diatomaceous earth.

Suspension concentrates may be water- or oil-based. They can be prepared, for example, by wet grinding by means of commercially available bead mills, if appropriate with addition of surfactants, as they have already been mentioned above for example in the case of the other formulation types.

Emulsions, for example oil-in-water emulsions (EW), can be prepared for example by means of stirrers, colloid mills and/or static mixtures using aqueous organic solvents and, if appropriate, surfactants as they have already been mentioned above for example in the case of the other formulation types.

Granules can be prepared either by spraying the compounds of formula (I) onto adsorptive, granulated inert material or by applying active substance concentrates onto the surface of carriers such as sand, kaolinites or of granulated inert material, by means of binders, for example polyvinyl alcohol, sodium polyacrylate or alternatively mineral oils. Suitable active substances can also be granulated in the manner which is conventional for the production of fertilizer granules, if desired in a mixture with fertilizers.

Water-dispersible granules are prepared, as a rule, by the customary processes such as spray-drying, fluidized-bed granulation, disk granulation, mixing in high-speed mixers and extrusion without solid inert material. To prepare disk, fluidized-bed, extruder and spray granules, see, for example, processes in "Spray-Drying Handbook" 3rd ed. 1979, G. Goodwin Ltd., London; J. E. Browning, "Agglomeration", Chemical and Engineering 1967, pages 147 et seq.; "Perry's Chemical Engineer's Handbook", 5th Ed., McGraw-Hill, New York 1973, p. 8-57. In general, the agrochemical preparations comprise a range selected from the group consisting of about 0.1 to about 99% by weight and about 0.1 to about 95% by weight, of compounds of formula (I).

The concentration of compounds of formula (I), (IA), (IB), (IC), (ID) and (IE) in wettable powders is, for example, about 10 to about 90% by weight, the remainder to 100% by weight being composed of customary formulation components. In the case of emulsifiable concentrates, the concentration of compounds of formula (I), (IA), (IB), (IC), (ID) and (IE) can amount to ranges selected from the group consisting of about 1% to about 90% and about 5% to about 80% by weight. Formulations in the form of dusts usually comprise in the range selected from the group consisting of about 1% to about 30% by weight of compounds of formula (I), (IA), (IB), (IC), (ID) and (IE) and about 5% to about 20% by weight of compounds of formula (I), (IA), (IB), (IC), (ID) and (IE). For sprayable solutions comprise a range selected from the group consisting of about 0.05% to about 80% by weight of compounds of formula (I), (IA), (IB), (IC), (ID) and (IE) and about 2% to about 50% by weight of compounds of formula (I). In the case of water-dispersible granules, the content of compounds of formula (I), (IA), (IB), (IC), (ID) and (IE) depends partly on whether the compounds of formula (I), (IA), (IB), (IC), (ID) and (IE) are in liquid or solid form and on which granulation auxiliaries, fillers and the like are being used. The water-dispersible granules, for example, comprise a range selected from the group consisting of between about 1 and about 95% and between about 10% and about 80% by weight.

In addition, the formulations of compounds of formula (I), (IA), (IB), (IC), (ID) and (IE) mentioned comprise, if appropriate, the adhesives, wetters, dispersants, emulsifiers, penetrants, preservatives, antifreeze agents, solvents, fillers, carriers, colorants, antifoams, evaporation inhibitors, pH regulators and viscosity regulators which are conventional in each case.

The terms "treating" or "treat" or "treatment" are intended to mean the application or administration of an isoxazoline compound of the invention to an animal that has a parasitic infestation for the eradication of the parasite or the reduction of the number of the parasites infesting the animal undergoing treatment. It is noted that the compositions of the invention comprising an isoxazoline compound together with a pharmaceutically acceptable carrier may be used to prevent such a parasitic infestation.

The compounds and compositions of the invention are administered in parasiticidally effective amounts which are suitable to control the parasite in question to the desired extent, as described below. In each aspect of the invention, the compounds and compositions of the invention can be applied against a single pest or combinations thereof. The compounds and compositions of the invention may be administered continuously, for treatment or prevention of parasitic infections or infestations. In this manner, an effective amount of the active isoxazoline compounds of the invention are delivered to the animal in need thereof to control the target parasites. By "effective amount" is intended a sufficient amount of a composition of the invention to eradicate or reduce the number of parasites infesting the animal. In one embodiment, an effective amount of the active agent achieves at least 70% efficacy against the target parasite compared to a negative control according to known methods used in the art (animal not treated or treated with a placebo). In other embodiments, an effective amount of the active agent achieves at least 80%, or at least 90% efficacy against the target pests. Preferably, an effective amount of the active agent will achieve at least 95% efficacy against the target pests. In some embodiments, an effective amount of the compounds and compositions of the invention achieve at least 98% or 100% efficacy against the target parasites.

Generally, a dose of from about 0.001 to about 100 mg per kg of body weight given as a single dose or in divided doses for a period of from 1 to 5 days will be satisfactory but, of course, there can be instances where higher or lower dosage ranges are indicated, and such are within the scope of this invention. It is well within the routine skill of the practitioner to determine a particular dosing regimen for a specific host and parasite.

In some embodiments for companion animals, the dose of the isoxazoline active agent administered is between about 0.1 to about 30 mg per kg of body weight. More typically the dose of the isoxazoline active agent administered is about 0.5 to about 20 mg/kg or about 0.5 to about 15 mg/kg body weight. Preferably, the dose of the isoxazoline active agent administered is about 0.5 to about 10 mg/kg, about 0.5 to about 8 mg/kg or about 0.5 to about 5 mg/kg of body weight.

In certain embodiments for the treatment and prevention of parasite infestations and infections in smaller animals (e.g. cats and other smaller mammals), the dose of the isoxazoline active agent administered will be about 0.5 to about 2 mg/kg of body weight, preferably about 1 mg/kg of bodyweight. In other embodiments for the very long lasting treatment and protection of smaller animals against parasitic infestations or infections a dose of about 2 to about 15 mg/kg of bodyweight or preferably about 5 to about 15 mg/kg of bodyweight will be administered.

In some embodiments for the treatment and protection of dogs from parasitic infestations and infections, a dose of about 2 to about 15 mg/kg of bodyweight of the isoxazoline active agent will be administered. In other embodiments, a dose of about 2 to about 8 mg/kg or about 2 to about 5 mg/kg of bodyweight will be administered.

In other embodiments for the treatment of livestock animals such as cattle or sheep, doses of the isoxazoline active agent administered may be about 1 to about 30 mg/kg of body weight. More typically the doses administered will be about 1 to about 20 mg/kg or about 1 to about 15 mg/kg. Preferably, a dose of the isoxazoline active agent administered to livestock animals will be about 1 to about 10 mg/kg of body weight.

Higher amounts may be provided for very prolonged release in or on the body of the animal. In another treatment embodiment, the amount of active agents for birds and other animals which are small in size is greater than about 0.01 mg/kg, and in another embodiment for the treatment of small-sized birds and other animals, the amount of is between about 0.01 and about 20 mg/kg of weight of animal. More typically the dose of the isoxazoline for small-sized animals and birds is about 0.5 to about 15 mg/kg, about 0.5 to about 10 mg/kg of body weight, or about 0.5 mg/kg to about 5 mg/kg of body weight.

In one embodiment of the method of use in dogs or cats, a composition comprising an isoxazoline compound of the invention has an efficacy against fleas and/or ticks of at least about 90.0% or higher for about 1 month, or longer. In another embodiment, the compositions of the invention provide an efficacy against fleas and/or ticks of at least 95.0% or higher for about 30 days, or longer.

In another embodiment, the compounds and compositions of the invention provide an efficacy against fleas and/or ticks in cats and dogs of at least about 80% for two months, or longer. In another embodiment, the compounds and compositions provide efficacy against fleas and/or ticks in cats and dogs of about 90% for about two months, or longer. In still another embodiment, the compounds and compositions provide an efficacy of about 95% for about 2 months or longer. In other embodiments, the compounds and composition provide longer-lasting efficacy against fleas and/or ticks including for about 3 months, or longer.

In one embodiment of the invention, the isoxazoline compounds may be administered in the form of topical compositions to the animal. Topical compositions include dips, shampoos, sprays, spot-ons, pour-ons, and the like. Application of topical compositions is to animals to control parasites is well known in the art.

In some embodiments, the isoxazoline compounds may be administered in solutions using any means known in the art, including using an applicator gun or a metering flask, pipette, syringes, roll on, droppers, capsules, foil packages, vials, twist tip containers, metered-dose aerosols or sprays and other single dose and multi-dose containers.

In another aspect of the invention, a kit for the treatment or prevention of a parasitic infestation in an animal is provided, which comprises at least one isoxazoline active agent of the invention together with a pharmaceutically acceptable carrier and a dispensing device for application of the composition. The dispensing device may be a pipette, syringes, roll on, droppers, capsules, foil packages, vials, twist tip containers, metered-dose aerosols or sprays and other single dose and multi-dose containers, which includes an effective dose of each active agent in the pharmaceutically acceptable carrier or diluent.

Proton and fluorine magnetic resonance (respectively <sup>1</sup>H NMR and <sup>19</sup>F NMR) spectra were recorded on a Varian INOVA NMR spectrometer [400 MHz (<sup>1</sup>H) or 500 MHz

(<sup>1</sup>H) and 377 MHz (<sup>19</sup>F)]. All spectra were determined in the solvents indicated. Chemical shifts are reported in ppm downfield of tetramethylsilane (TMS), referenced to the residual proton peak of the respective solvent peak for <sup>1</sup>H NMR. Interproton coupling constants are reported in Hertz (Hz).

LC-MS spectra were obtained using two different systems. For LCMS method 1, LC-MS spectra were obtained using an Agilent 1200SL HPLC equipped with a 6130 mass spectrometer operating with electrospray ionization; chromatographic data were obtained using a Shimadzu Shimpack XR-ODS, 3.0×30 mm, 2.2 micron particle size column and a water:methanol gradient from 15% methanol to 95% methanol in 2.2 minutes under a 1.5 mL/min flow; a hold at 95% methanol was applied at the end of the gradient for 0.8 minutes; and both water and methanol mobile phases contained 0.1% formic acid. For LCMS method 2, LCMS spectra were obtained using a Waters ACQUITY UPLC™ equipped with a Thermofinnigan AQA™ mass spectrometer operating with electrospray ionization; chromatographic data were obtained using a Supelco® Analytical Ascentis® Express, 2.1×50 mm, 2.7 micron particle size column (C<sub>18</sub>) and a water:acetonitrile gradient from 5% acetonitrile to 100% acetonitrile in 0.8 minute under a 1.5 mL/min flow; a hold at 100% methanol was applied at the end of the gradient for 0.05 minutes; and water mobile phase was buffered with ammonium acetate (10 mmolar) and 0.1% v/v. acetic acid. When LCMS retention times are reported as RT, LCMS method 1 or 2 is then specified.

When semi-preparative HPLC was carried out to purify reaction mixture, a modified Gilson HPLC system was used with offline regeneration; chromatographic data were obtained using a Varian Pursuit™ XRS, 21.4×50 mm, 10 micron particle size column (C18) and a water:methanol gradient from 40% methanol to 100% methanol in 5 minutes under a 28 mL/min flow; and water mobile phase was buffered with ammonium acetate (10 mmolar) and 0.1% v/v. ammonium hydroxide.

## Biological Activity Against Parasites

## Example 19

## Efficacy of Compounds Against Fleas Following Ingestion

A cylindrical test container was filled with 10 adult *Ctenocephalides felis*. A cylindrical well was closed on one end with a self-sealing flexible film and placed on top of the test container in such a position that the fleas could pierce the film and feed on the contents of the cylinder. The test compound solution was then pipetted into bovine blood and added to the well. The container part with the *Ctenocephalides felis* was held at 20-22° C. and 40-60% relative humidity while the well part containing the treated blood was held at 37° C. and 40-60% relative humidity. Assessment was performed at 72 hours after application in comparison with untreated controls. Using this test, compounds 69, 77, 84, 95, 82, 92, 87, 83, 100, 114, 54 and 72 were found to have EC<sub>50</sub> values of ≤10 parts per million (ppm). Compounds 90, 98, 99, 96, 97, 94, 91, 93, 61, 70, 78, 67 and 68 were found to have EC<sub>50</sub> values of ≤1 ppm; and compounds 80, 89, 88, 57, 71, 74, 75, 76, 112 and 115 were found to have EC<sub>50</sub> values of ≤0.1 ppm.

## Example 20

## Effect of Carbonyl Substituent

It was found that inclusion of at least one carbonyl substituent in the dinitrogen-containing heterocyclic ring of the compounds of formula (I) resulted in a surprising enhancement of efficacy against fleas. In this regard, the efficacy of the compounds of the invention having at least one carbonyl group in Ring D against fleas was compared with the efficacy of corresponding compounds that are not substituted with a carbonyl group in Ring D using the method of Example 19. The table below demonstrates the surprising effect of the substitution on Ring D.
