1,2,5-SUBSTITUTED BENZIMIDAZOLES AS FLAP MODULATORS

CROSS REFERENCE TO RELATED APPLICATIONS

This application is a continuation of U.S. application Ser. No. 14/714,917, filed on May 18, 2015, which is a divisional of U.S. application Ser. No. 14/208,373, filed on Mar. 13, 2014, now U.S. Pat. No. 9,067,917, which claims the benefit of U.S. Provisional Application No. 61/799,660, filed on Mar. 15, 2013, each of which is incorporated herein by reference in its entirety.

FIELD OF THE INVENTION

The present invention relates to substituted compounds useful as 5-lipoxygenase-activating protein (FLAP) modulators, pharmaceutical compositions of such compounds, methods of preparation and use thereof. More particularly, FLAP modulators are useful for preventing, treating or ameliorating FLAP-mediated diseases and/or disorders, including those inflammation diseases and/or disorders associated with dermatological and respiratory disorders, allergic disorders, autoimmunity, cancer, cardiovascular and metabolic disorders.

BACKGROUND OF THE INVENTION

FLAP is a key initiator of the leukotriene synthesis pathway that binds and then transfers arachidonic acid to 5-lipoxygenase (M. Abramovitz et al., "5-lipoxygenase-activating protein stimulates the utilization of arachidonic acid by 5-lipoxygenase," *Eur. J. Biochem.*, 1993, 215, 105-11). FLAP has been demonstrated to interact with LTC₄ synthase, and could putatively modulate the production of LTC₄ (T. Strid et al., "Distinct parts of leukotriene C(4) synthase interact with 5-lipoxygenase and 5-lipoxygenase activating protein," *Biochem. Biophys. Res. Comm.*, 2009, 381(4), 518-22). Modulation (including without limitation inhibition) or genetic deletion of FLAP blocks leukotriene production, specifically LTB₄, the cysteinyl leukotrienes (LTC₄, LTD₄ and LTE₄) as well as 5-oxo-ETE (J. Z. Haeggström et al., "Lipoxygenase and leukotriene pathways: biochemistry, biology, and roles in disease," *Chem Rev.*, 2011, 111(10), 5866-98).

Leukotrienes are immune-modulating lipids formed from arachidonic acid (reviewed in B. Samuelsson, "Leukotrienes: mediators of immediate hypersensitivity reactions and inflammation," *Science*, 1983, 220, 568-75). They are synthesized primarily by eosinophils, neutrophils, mast cells, basophils, dendritic cells, macrophages and monocytes. Leukotrienes mediate multiple biological effects including, by way of example only, smooth muscle contraction, leukocyte recruitment and activation, cytokine secretion, fibrosis, mucous secretion, and vascular function (J. Z. Haeggström, at 5866-98).

FLAP-deficient mice are healthy and reproduce normally. They do not produce leukotrienes and have decreased susceptibility in mouse models of arthritis (R. J. Griffiths et al., "Collagen-induced arthritis is reduced in 5-lipoxygenase-activating protein-deficient mice," *J. Exp. Med.*, 1997, 185, 1123-29). In humans, FLAP itself has been linked by genetic studies to respiratory disorders and cardiovascular disease, including myocardial infarction, atherosclerosis, cerebral infarctions, coronary artery disease and stroke (A. Helgadóttir et al., "The gene encoding 5-lipoxygenase activating protein confers risk of myocardial infarction, atherosclerosis and stroke," *Nat. Genet.*, 2004, 36, 233-39; A. S. Tulah et al., "The role of ALOX5AP, LTA4H and LTB4R polymor-

phisms in determining baseline lung function and COPD susceptibility in UK smokers," *BMC Med. Genet.*, 2011, 29(12), 173; R. Ji et al., "Genetic variants in the promoter region of the ALOX5AP gene and susceptibility of ischemic stroke," *Cerebrovasc. Dis.*, 2011, 32(3), 261-68; J. W. Holloway et al., "The role of LTA4H and ALOX5AP polymorphism in asthma and allergy susceptibility," *Allergy*, 2008, 63(8), 1046-53; J. Nair et al., "Expression analysis of leukotriene-inflammatory gene interaction network in patients with coronary artery disease," *J. Atheroscler. Thromb.*, 2013; L. F. Chi et al., "Interaction between ALOX5AP and CYP3A5 gene variants significantly increases the risk for cerebral infarctions in Chinese," *Neuroreport.*, 2013). In addition, studies using animal models support a causative role for leukotrienes in aortic aneurysms, pulmonary arterial hypertension, myocardial infarction, atherosclerosis, and stroke (reviewed in J. Z. Haeggström, at 5866-98).

Leukotrienes also play a role in autoimmune disorders such as rheumatoid arthritis, inflammatory bowel disease, nephritis, spondyloarthritis, polymyositis, dermatomyositis, gouty effusions, systemic lupus erythematosus, systemic sclerosis, Alzheimer's disease and multiple sclerosis (S. Chwieńsko-Minarowska et al., "The role of leukotrienes in the pathogenesis of systemic sclerosis," *Folia Histochem. Cytobiol.*, 2012, 50(2), 180-85; M. Rosnowska et al., "Leukotrienes C4 and B4 in cerebrospinal fluid of patients with multiple sclerosis," *Pol. Merkurusz Lek.*, 1997, 2, 254-55; and reviewed in J. Z. Haeggström, at 5866-98; I. Loell et al., "Activated LTB4 pathway in muscle tissue of patients with polymyositis or dermatomyositis," *Ann. Rheum. Dis.*, 2013, 72(2), 293-99; J. Chu et al., "Involvement of 5-lipoxygenase activating protein in the amyloidotic phenotype of an Alzheimer's disease mouse model," *J. Neuroinflammation*, 2012, 9, 127). Leukotrienes have also been implicated in several aspects of carcinogenesis including tumor cell proliferation, differentiation, apoptosis, tumor-associated angiogenesis, as well as the migration and invasion of carcinoma cells (D. Wang and R. N. Dubois, "Eicosanoids and cancer," *Nat. Rev. Cancer*, 2010, 10(3), 181-93).

Leukotrienes play a key role in allergic disorders such as allergic rhinitis, allergic dermatitis and asthma, as well as respiratory disorders such as exacerbations, non-allergic asthma, aspirin exacerbated respiratory disease, fibrotic lung diseases, acute respiratory distress syndrome and chronic obstructive pulmonary disease (reviewed in J. Z. Haeggström at 5866-98). Approved antagonists of the LTC₄ receptor and leukotriene synthesis modulators such as zileuton have shown clinical efficacy in a variety of respiratory disorders (reviewed in M. E. Krawiec and S. E. Wenzel, "Leukotriene modulators and non-steroidal therapies in the treatment of asthma," *Expert. Opin. Pharmacotherapy*, 2001, 2(1), 47-65).

All the above evidence supports a key role of leukotrienes in a variety of human diseases and/or disorders, and FLAP modulation would be effective for the prevention, treatment, or amelioration of these immune-mediated inflammatory diseases and/or disorders. Furthermore, there still remains a need for FLAP modulator compounds that have pharmacokinetic and pharmacodynamic properties suitable for use as human pharmaceuticals.

With reference to substituents, the term "independently" means that when more than one of such substituent is possible, such substituents may be the same or different from each other.

It is intended that the definition of any substituent or variable at a particular location in a molecule be independent of its definitions elsewhere in that molecule. It is understood that substituents and substitution patterns on the compounds of this invention can be selected by one of ordinary skill in the art to provide compounds that are chemically stable and that can be readily synthesized by techniques known in the art as well as those methods set forth herein.

In general, IUPAC nomenclature rules are used herein.

The term "about," whether used explicitly or not in reference to a quantitative expression given herein, means that every quantity given herein qualified with the term or otherwise is meant to refer both to the actual given value and the approximation to such given value that would reasonably be inferred based on the ordinary skill in the art, including approximations due to experimental and/or measurement conditions for such given value.

The term "form" means, in reference to compounds of the present invention, such may exist as, without limitation, a salt, stereoisomer, tautomer, crystalline, polymorph, amorphous, solvate, hydrate, ester, prodrug or metabolite form. The term "composition" is intended to encompass a product comprising the specified ingredients in the specified amounts, as well as any product which results, directly or indirectly, from combinations of the specified ingredients in the specified amounts.

The term "subject" as used herein, refers to a patient, such as an animal, a mammal or a human, who has been the object of treatment, observation or experiment and is at risk of (or susceptible to) developing an FLAP-mediated disorder.

The term "administering" further means that the individual ingredients to be combined may be administered at the same time or at different times during the treatment period, either as one preparation or as different preparations. Accordingly, the invention should be so interpreted that it encompasses any and every administration mode at the same time or at different times. The range of the combination of the compound of the invention and the other therapeutic agent useful for the above-mentioned disorders encompasses, in principle, all combinations of the compound of the

invention and any and every pharmaceutical agent useful for the above-mentioned disorders.

The term "treating" refers, without limitation, to facilitating the eradication of, preventing, ameliorating or otherwise inhibiting the progression of or promoting stasis of an FLAP-mediated disease and/or disorder, or associated symptoms or complications thereof.

The term "prodrug" means a compound of Formula (I) or a form thereof that is converted in vivo into a functional derivative form that may contribute to therapeutic biological activity, wherein the converted form may be: 1) a relatively active form; 2) a relatively inactive form; 3) a relatively less active form; or, 4) any form which results, directly or indirectly, from such in vivo conversions. Prodrugs are useful when said compound may be either too toxic to administer systemically, absorbed poorly by the digestive tract or broken down by the body before it reaches its target. Conventional procedures for the selection and preparation of suitable prodrug derivatives are described in, for example, *"Design of Prodrugs"*, ed. H. Bundgaard, Elsevier, 1985.

The term "metabolite" means a prodrug form of a compound of Formula (I) or a form thereof converted by in vivo metabolism or a metabolic process to a relatively less active functional derivative of said compound.

The term "medicament" or "medicine" refers to a product containing a compound of Formula (I) or a form thereof. The present invention includes use of such a medicament for treating an FLAP-mediated disorder.

The term "combination form" refers to the use of a combination product comprising a compound of Formula (I) or a form, pharmaceutical composition, medicine or medicament thereof and at least one therapeutic agent for treating an FLAP-mediated disorder.

Methods are known in the art for determining effective doses for therapeutic and prophylactic purposes for the disclosed pharmaceutical compositions or the disclosed drug combinations, whether or not formulated in the same composition.

For therapeutic purposes, the term "therapeutically effective amount" or "effective amount" as used herein, means that amount of each active compound or pharmaceutical agent, alone or in combination, that elicits the biological or medicinal response in a tissue system, animal or human that is being sought by a researcher, veterinarian, medical doctor or other clinician, which includes alleviation of the symptoms of the disease and/or disorder being treated. For prophylactic purposes (i.e., inhibiting the progression of a disorder), the term "therapeutically effective amount" refers to that amount of each active compound or pharmaceutical agent, alone or in combination, that treats or inhibits in a subject the progression of a disorder as being sought by a researcher, veterinarian, medical doctor or other clinician. Thus, the present invention provides combinations of two or more drugs wherein, for example, (a) each drug is administered in an independently therapeutically or prophylactically effective amount; (b) at least one drug in the combination is administered in an amount that is sub-therapeutic or sub-prophylactic if administered alone, but is therapeutic or prophylactic when administered in combination with the second or additional drugs according to the invention; or (c) both (or more) drugs are administered in an amount that is sub-therapeutic or sub-prophylactic if administered alone, but are therapeutic or prophylactic when administered together. The effective amount of said compound is from about 0.001 mg/kg/day to about 300 mg/kg/day.

Advantageously, the effective amount of a combination product for treating an FLAP-mediated disease and/or dis-

order, or associated symptoms or complications thereof, may be a reduced amount of either or both, the compound or therapeutic agent, compared to the effective amount of the compound or therapeutic agent otherwise recommended for treating the disease and/or disorder, or associated symptoms or complications thereof. Therefore, it is contemplated that the compound is administered to the subject before, during or after the time the agent is administered.

The term "pharmaceutically acceptable salt" refers to non-toxic pharmaceutically acceptable salts (*Ref. Int'l J. Pharm.*, 1986, 33: 201-217; *J. Pharm. Sci.*, 1997 (January), 66(1): 1). Other salts well known to those in the art may, however, be useful in the preparation of compounds according to this invention or of their pharmaceutically acceptable salts. Representative organic or inorganic acids include, but are not limited to, hydrochloric, hydrobromic, hydriodic, perchloric, sulfuric, nitric, phosphoric, acetic, propionic, glycolic, lactic, succinic, maleic, fumaric, malic, tartaric, citric, benzoic, mandelic, methanesulfonic, hydroxyethanesulfonic, benzenesulfonic, oxalic, pamoic, 2-naphthalenesulfonic, p-toluenesulfonic, cyclohexanesulfamic, salicylic, saccharinic or trifluoroacetic acid. Representative organic or inorganic bases include, but are not limited to, basic or cationic salts such as benzathine, chlorprocaine, choline, diethanolamine, ethylenediamine, meglumine, procaine, aluminum, calcium, lithium, magnesium, potassium, sodium and zinc.

The compounds of the invention may be present in the form of pharmaceutically acceptable salts. For use in medicines, the "pharmaceutically acceptable salts" of the compounds of this invention refer to non-toxic acidic/anionic or basic/cationic salt forms.

Suitable salt forms include acid addition salts which may, for example, be formed by mixing a solution of the compound according to the invention with a solution of an acid such as acetic acid, adipic acid, benzoic acid, carbonic acid, citric acid, fumaric acid, glycolic acid, hydrochloric acid, maleic acid, malonic acid, phosphoric acid, saccharinic acid, succinic acid, sulphuric acid, tartaric acid, trifluoroacetic acid and the like.

Furthermore when the compounds of the present invention carry an acidic moiety, suitable salts thereof may include alkali metal salts, e.g. sodium or potassium salts; alkaline earth metal salts, e.g. calcium or magnesium salts; and salts formed with suitable organic ligands, e.g. quaternary ammonium salts.

During any of the processes for preparation of the compounds of the present invention, it may be necessary and/or desirable to protect sensitive or reactive groups on any of the molecules concerned. This may be achieved by means of conventional protecting groups, such as those described in *Protective Groups in Organic Chemistry*, ed. J. F. W. McOmie, Plenum Press, 1973; and T. W. Greene & P. G. M. Wuts, *Protective Groups in Organic Synthesis*, 3rd Edition, John Wiley & Sons, 1999. The protecting groups may be removed at a convenient subsequent stage using methods known in the art. The scope of the present invention encompasses all such protected compound forms and mixtures thereof.

The invention includes compounds of various isomers and mixtures thereof. The term "isomer" refers to compounds that have the same composition and molecular weight but differ in physical and/or chemical properties. Such substances have the same number and kind of atoms but differ in structure. The structural difference may be in constitution (geometric isomers) or in an ability to rotate the plane of polarized light (optical isomers).

The term "stereoisomer" refers to isomers that have the same molecular formula and the same sequence of covalently bonded atoms but a different spatial orientation.

The term "optical isomer" means isomers of identical constitution that differ only in the spatial arrangement of their groups. Optical isomers rotate the plane of polarized light in different directions. The term "optical activity" means the degree to which an optical isomer rotates the plane of polarized light.

The term "racemate" or "racemic" means an equimolar mixture of two enantiomeric species, wherein each of the isolated species rotates the plane of polarized light in the opposite direction such that the mixture is devoid of optical activity.

The term "enantiomer" means an isomer having a non-superimposable mirror image. The term "diastereomer" means stereoisomers that are not enantiomers.

The term "chiral" means a molecule that, in a given configuration, cannot be superimposed on its mirror image. This is in contrast to achiral molecules that can be superimposed on their mirror images.

The two distinct mirror image versions of the chiral molecule are also known as levo (left-handed), abbreviated L, or dextro (right-handed), abbreviated D, depending on which way they rotate polarized light. The symbols "R" and "S" represent the configuration of groups around a stereogenic carbon atom(s).

The symbols "R" and "S" are used in compound names and/or compound structures to describe a pure enantiomer, where the absolute stereochemistry of groups around a stereogenic carbon atom(s) is known.

The symbols "R*" and "S*" are used in compound names and/or compound structures to describe a pure enantiomer, where the relative stereochemistry of groups around a stereogenic carbon atom(s) is known, but where the absolute stereochemistry is unknown.

The term "geometric isomer" means isomers that differ in the orientation of substituent atoms in relationship to a carbon-carbon double bond, to a cycloalkyl ring, or to a bridged bicyclic system. Substituent atoms (other than hydrogen) on each side of a carbon-carbon double bond may be in an E or Z configuration according to the Cahn-Ingold-Prelog priority rules. In the "E" configuration, the substituents having the highest priorities are on opposite sides in relationship to the carbon-carbon double bond. In the "Z" configuration, the substituents having the highest priorities are oriented on the same side in relationship to the carbon-carbon double bond.

Substituent atoms (other than hydrogen) attached to a ring system may be in a "cis" or "trans" configuration. In the "cis" configuration, the substituents are on the same side in relationship to the plane of the ring; in the "trans" configuration, the substituents are on opposite sides in relationship to the plane of the ring. Compounds having a mixture of "cis" and "trans" species are designated "cis/trans".

The compounds of the invention may be prepared as individual isomers by either isomer-specific synthesis or resolved from an isomeric mixture. Conventional resolution techniques include combining the free base (or free acid) of each isomer of an isomeric pair using an optically active acid (or base) to form an optically active salt (followed by fractional crystallization and regeneration of the free base), forming an ester or amide of each of the isomers of an isomeric pair by reaction with an appropriate chiral auxiliary (followed by fractional crystallization or chromatographic separation and removal of the chiral auxiliary), or separating

an isomeric mixture of either an intermediate or a final product using various well known chromatographic methods.

Furthermore, compounds of the present invention may have one or more polymorph or amorphous crystalline forms and, as such, are intended to be included in the scope of the invention. In addition, some of the compounds may form solvates with water (i.e., hydrates) or common organic solvents (e.g., organic esters such as ethanolate and the like) and, as such, are also intended to be encompassed within the scope of this invention.

B) Synthesis

The invention provides methods of making the disclosed compounds according to traditional organic synthetic methods as well as matrix or combinatorial synthetic methods. Schemes A-D described suggested synthetic routes. Using the schemes, the guidelines below, and the examples, a person of skill in the art may develop analogous or similar methods for a given compound that is within the invention. These methods are representative of the synthetic schemes, but are not to be construed as limiting the scope of the invention.

Where the compounds according to this invention have at least one chiral center, they may accordingly exist as enantiomers. Where the compounds possess two or more chiral centers, they may additionally exist as diastereomers. Where the processes for the preparation of the compounds according to the invention give rise to mixtures of stereoisomers, these isomers may be separated by conventional techniques such as preparative chromatography. The compounds may be prepared in racemic form or as individual enantiomers or diastereomers by either stereospecific synthesis or by resolution. The compounds may, for example, be resolved into their component enantiomers or diastereomers by standard techniques, such as the formation of stereoisomeric pairs by salt formation with an optically active base, followed by fractional crystallization and regeneration of the free acid. The compounds may also be resolved by formation of stereoisomeric esters or amides, followed by chromatographic separation and removal of the chiral auxiliary. Alternatively, the compounds may be resolved using a chiral HPLC column. It is to be understood that all stereoisomers, racemic mixtures, diastereomers, geometric isomers, and enantiomers thereof are encompassed within the scope of the present invention.

The format of the 1H NMR data below is: chemical shift in ppm down field of the tetramethylsilane reference (multiplicity, coupling constant J in Hz, integration).

Hydrochloride salts were obtained by treating the corresponding free bases with HCl (4 N in dioxane, 2 M in Et_2O , or 1.25 N in MeOH) at RT with mixtures and then either concentrated to obtain the HCl salt, or the resulting solid being isolated by filtration. Trifluoroacetic acid salts were obtained by purification of the crude reaction product by preparative reverse phase HPLC, whereby the final products were isolated as either mono-, di- or tri trifluoroacetic acid salts.

Chemical names were generated using Chem Draw Ultra 12.0 (CambridgeSoft Corp., Cambridge, Mass.) or ACD/Name Version 10.01 (Advanced Chemistry).

The compounds of Formula (I), wherein ring A, R^1 , R^5 and R^6 are defined as in Formula (I), may be synthesized as outlined by the general synthetic route illustrated in Scheme A.

Referring to Scheme A, compounds of Formulae (I) are prepared from cyclization of diamines (V) with anhydrides, di-acids, or aldehyde containing acids where R^1 is an aryl or heteroaryl substituent and R^5 may contain substituents such as alkyl or cycloalkyl carboxylic acids. Ring A may represent or contain various substituents such as alkyls, cycloalkyls, halogens, amines, ethers, and aromatic or heteroaromatic rings. Various substituted anhydrides and diacids used in the preparation of compounds of Formulae (I) were obtained from commercial sources or were prepared using known methods. R^6 may be hydrogen or one of various alkyl substituents. Diamines of formula (V) are obtained via alkylation of 4-fluoro-3-nitrophenol (II) with aryl or heteroaryl methylhalides. Preferably, 4-fluoro-3-nitrophenol (II) is treated with the desired halide in the presence of a base, such as K_2CO_3 , Cs_2CO_3 , or $NaOH$, with or without the presence of potassium iodide in a suitable polar solvent, such as CH_3CN , dimethyl formamide (DMF), dimethyl acetamide (DMA), tetrahydrofuran (THF), or a mixture thereof, at a temperature ranging from about $50^\circ C$. to about $180^\circ C$. using conventional heating or microwave irradiation. Nitroethers (III) are converted to compounds of Formulae (IV) via nucleophilic aromatic substitution (S_NAr) with aryl or heteroaryl-substituted methylene amines in the presence of a suitable base, such as DIPEA, Et_3N , or a mixture thereof, in a solvent, such as CH_3CN , DMF, DMA, N-methyl-2-pyrrolidone (NMP) or a mixture thereof, at a temperature ranging from about $50^\circ C$. to about $150^\circ C$. Diamines (V) are obtained by reduction of the nitro group using generally known methods, such as hydrogenation over a Pd or Pt catalyst using H_2 , in solvents, such as THF, MeOH and EtOH, with or without the presence of DIPEA, or Et_3N . Alternatively, the nitro group can be reduced through the use of a heterogeneous stoichiometric reductant, such as Zn metal powder, in the presence of an acid, such as NH_4Cl or HOAc, in a solvent, such as MeOH, EtOH, acetone, or THF, at a temperature ranging from $0^\circ C$. to the reflux temperature of the solvent. Additionally, reduction can occur in the presence of a homogeneous stoichiometric reductant, such as $SnCl_2 \cdot 2H_2O$, in solvents, such as EtOH, MeOH, and EtOAc, at temperatures ranging from $0^\circ C$. to the reflux temperature of the solvent. Formation of (I) can be achieved

in a two-step process by first reacting diamine (V) with appropriate anhydrides in the presence of a base, such as DIPEA, in a solvent, such as CH_3CN , at a temperature ranging from about $50^\circ C$. to about $90^\circ C$. The product thus obtained is converted to (I) by subjecting it to further heating from $0^\circ C$. to the reflux temperature of the solvent, either conventionally or in a microwave reactor, in the presence of an acid, such as HCl, HOAc, or MsOH. Alternatively, formation of (I) can be achieved by heating diamine (V) and an appropriate organic diacid in the presence of a strong acid catalyst or Lewis acidic dehydrating agent, such as HCl or $SnCl_4$ respectively, at a temperature ranging from about $50^\circ C$. to about $90^\circ C$. In some instances, such as to ease purification, it is desirable to convert (I) to the corresponding alkyl ester by treating (I) with a strong acid, such as HCl, in the presence of an alcoholic solvent, such as EtOH or MeOH, at temperatures ranging from RT to $100^\circ C$. Methyl esters of (I) can also be obtained using $TMSCHN_2$ in a mixture of toluene and MeOH. Benzimidazole (I) is then obtained by subsequent hydrolysis using known acidic or basic conditions. Preferably, hydrolysis is conducted using a base, such as LiOH, NaOH or KOH, in solvents, such as MeOH, THF, or a mixture thereof, at temperatures ranging from RT to about $80^\circ C$. Alternatively, compounds of Formulae (I) can be synthesized directly via a reductive coupling from compounds of Formulae (IV) using the corresponding aldehyde or hemiacetal. This reaction is accomplished in the presence of a reducing agent, such as sodium dithionite, in a solvent, such as DMA. Alternatively, compounds of Formulae (IV) could be obtained by alkylation of 4-amino-3-nitrophenol (VII) using analogous conditions stated above to provide (VI). Alkylation with suitable aryl or heteroaryl halomethanes in the presence of a base, such as $(iPr)_2NEt$ or Et_3N , in a solvent, such as CH_3CN , at a temperature ranging from about $50^\circ C$. to about $150^\circ C$., provides compounds of Formulae (IV). Additionally, compounds of Formulae (IV) can be obtained via reductive amination of (VI). Reductive aminations are performed using the appropriate aryl or heteroaryl aldehyde in the presence of a reductant, such as $Na(OAc)_3BH$ or $NaB(CN)H_3$, in solvents, such as dichloromethane (DCM), dichloroethane (DCE), or THF or mixtures thereof.

Referring to Scheme B, in alternative embodiments, benzimidazoles of Formulae (I) are obtained by alkylation and hydrolysis of phenol (XI). Phenols (XI) are prepared from an intermediate (VIII), wherein the phenol is protected with an appropriate protecting group, such as methyl, and the amino group alkylated, either by an S_N2 process or by reductive amination, using conditions described above to afford (IX). Reduction of the nitro group of (IX) to afford diamines (X) can be performed using conditions described above. Cyclization of (X) to afford (XI) can be performed using methods described above. The protecting group on the phenol of compounds of Formulae (X) may be removed using generally accepted methods. More specifically, when the protecting group is methyl, compounds of Formulae (XI) can be prepared using an appropriate reagent, such as BBr_3 , in a solvent, such as DCM, at a temperature ranging from -78°C . to RT. Alkylation of (XI) and hydrolysis of the ester of R^5 , if present, are performed using methods described in Scheme A.

-continued

Referring to Scheme C, compounds of Formulae (I) can be obtained by N-alkylation of one of the benzimidazole (XIII) nitrogens followed by hydrolysis of the ester substituent of R^5 . Benzimidazole (XIII) can be obtained from diamines XII using known procedures described in Scheme A. Reduction of the nitro group of (VI) using methods described above affords diamine (XII). Cyclization of (XII) to give (XIII) can be performed using conditions described above. Alkylation is performed with the desired aryl- or heteroaryl methylene halide in the presence of a base, such as K_2CO_3 , Cs_2CO_3 , or NaOH, a suitable polar solvent, such as CH_3CN , DMF, DMA, THF, or a mixture thereof, at a temperature ranging from about RT to about 180°C . Hydrolysis of the ester group R^5 can be performed using procedures described above.

1) Amination
2) Hydrolysis

Scheme D

Referring to Scheme D, benzimidazoles (XIV), where X¹, X² or X³ is an appropriate halogen, preferably Br, and substituent R⁵ is protected as an ester, can be coupled with various amines, aryls, and heteroaryls using known organometallic cross coupling methods. Coupling of the aromatic halides (XIV) with various amines, boronic acids, boronic esters, and stannanes in the presence of a catalyst, such as Pd(dppf)Cl₂·CH₂Cl₂, Pd(OAc)₂, Pd(PPh₃)₄, or RuPhos/RuPhos pre-catalyst, in a solvent, such as THF, 1,4-dioxane, DMA, DMF, DME, or toluene, in the presence of a base, such as NaOt-Bu, LiHMDS, Na₂CO₃, K₂CO₃, Cs₂CO₃, or K₃PO₄, affords esters of benzimidazole (I). Preferred catalysts for amination include Pd(dppf)Cl₂·CH₂Cl₂ and RuPhos/RuPhos pre-catalyst with K₃PO₄, NaOt-Bu or LiHMDS in 1,4-dioxane, toluene, or THF at temperatures ranging from about RT to the boiling point of the solvent. In instances where R⁵ contains an alkyl ester, hydrolysis using methods described above provides (I).

The Celite was then rinsed with additional THF (50 mL). The resulting solution was concentrated to afford the title compound (5.5 g, 51%), which was used without further purification. MS (ESI): mass calcd. for C₂₃H₂₀BrN₃O, 433.07; m/z found, 434.1 [M+H]⁺.

Method B:

To a 1 L round-bottomed flask were added a stir bar, N-(4-bromobenzyl)-2-nitro-4-(quinolin-2-ylmethoxy)aniline (6.1 g, 13 mmol), tin(II) chloride dihydrate (12.5 g, 55.4 mmol) and ethanol (250 mL). The resulting mixture was heated to 80° C. After 24 h, the mixture was cooled and partitioned between water (100 mL) and EtOAc (300 mL). The mixture was stirred vigorously while the pH was adjusted to 8 using 2 M sodium carbonate. The organic layer was separated and washed with brine (100 mL), dried with magnesium sulfate, filtered, and concentrated to dryness to afford the title compound (3.1 mg, 54%). The residue was kept under vacuum until use.

Step C: racemic cis-2-[1-(4-Bromobenzyl)-5-(quinolin-2-ylmethoxy)-1H-benzimidazol-2-yl]cyclohexanecarboxylic acid

To a 100 mL round-bottomed flask was added N1-(4-bromobenzyl)-4-(quinolin-2-ylmethoxy)benzene-1,2-diamine (1.3 g, 2.9 mmol), cis-hexahydroisobenzofuran-1,3-dione (0.5 g, 2.9 mmol) and acetonitrile (27 mL). The resulting solution was heated to 90° C. After 3 h, the reaction was cooled to RT and HCl (15 mL, 6 N) was added and the mixture was heated to 90° C. for 15 h. The resulting mixture was cooled to RT and concentrated to dryness. The residue was partitioned between water (100 mL) and DCM (100 mL) and the mixture was stirred vigorously while the pH was adjusted to 4-5 using sat. NaHCO₃. The organic layer was separated and the aqueous layer was further extracted with DCM (2×100 mL). The combine organic layers were dried with magnesium sulfate, filtered, and concentrated to dryness. The residue was subjected to FCC to give the title compound (750 mg, 44%). MS (ESI): mass calcd. for C₃₁H₂₈BrN₃O₃, 569.13; m/z found, 570.1 [M+H]⁺. ¹H NMR (500 MHz, CD₃OD) δ 8.36 (d, J=8.5, 1H), 8.05 (d, J=8.5, 1H), 7.93 (d, J=8.2, 1H), 7.78 (ddd, J=8.4, 6.9, 1.4, 1H), 7.74 (d, J=8.5, 1H), 7.60 (ddd, J=8.1, 7.0, 1.1, 1H), 7.47-7.41 (m, 2H), 7.29 (d, J=2.3, 1H), 7.19 (d, J=8.8, 1H), 7.05 (d, J=8.5, 2H), 7.01 (dd, J=8.8, 2.4, 1H), 5.53-5.41 (m, 2H), 5.39 (s, 2H), 3.60-3.51 (m, 1H), 2.88-2.76 (m, 1H), 2.43-2.29 (m, 1H), 2.00-1.93 (m, 1H), 1.92-1.69 (m, 4H), 1.52-1.36 (m, 2H).

The mixture was heated to 80° C. for 24 h at which point the reaction was cooled to RT and concentrated to dryness. The resulting residue was washed with water (2x20 mL) and then dissolved in EtOAc, dried over Na_2SO_4 , filtered and then concentrated. The material was used without further purification. MS (ESI): mass calcd. for $C_{24}H_{18}F_3N_3O_3$, 453.13; m/z found, 454.1 [M+H]⁺.

The reaction vessel was evacuated and then placed under one atmosphere of hydrogen for 16 h. The mixture was then flushed with N_2 and filtered through a pad of Celite. The Celite was then rinsed with additional THF (25 mL). The resulting solution was concentrated to dryness to afford the title compound which was used without further purification. The vial was capped and irradiated in the microwave reactor at 120° C. for 30 minutes. The mixture was then partitioned between water (20 mL) and EtOAc (20 mL). The layers were separated and the aqueous further extracted with EtOAc (2×20 mL). The organics were combined, dried (Na₂SO₄), filtered and concentrated to dryness. The residue was purified using reverse phase HPLC to afford the title compound. MS (ESI): mass calcd. for C₃₇H₃₅N₃O₄, 585.26; m/z found, 586.2 [M+H]⁺.

Step B. 1-([1-(4-Furan-3-ylbenzyl)-5-(quinolin-2-ylmethoxy)-1H-benzimidazol-2-yl]methyl)cyclopentanecarboxylic Acid

To a 20 mL vial were added ethyl 1-((1-(4-(furan-3-yl)benzyl)-5-(quinolin-2-ylmethoxy)-1H-benzo[d]imidazol-2-yl)methyl)cyclopentanecarboxylate (60 mg, 0.1 mmol), THF (1.3 mL) and MeOH (1.3 mL) followed by LiOH (1.4 mL, 1 M). The reaction mixture was heated at 80° C. for 1.5 h. The mixture was cooled to RT and concentrated to dryness. Water (5 mL) was added and the pH was adjusted to ~5-6 using 1 M HCl. To the mixture was added DCM (5 mL) and the mixture was stirred for 1 h at RT. The organic layer was separated then concentrated to dryness. The resulting residue was purified using FCC or reverse phase HPLC to provide the title compound. those skilled in the art. Furthermore, it is evident that said effective daily amount may be lowered or increased depending on the response of the treated patient and/or depending on the evaluation of the physician prescribing the compounds of the instant invention. The effective daily amount ranges mentioned herein are therefore only guidelines in practicing the present invention.

Preferably, the method for the treatment of the FLAP diseases and/or disorders described in the present invention using any of the compounds as defined herein, the dosage form will contain a pharmaceutically acceptable carrier containing between from about 1 mg to about 1000 mg; particularly from about 0.5 mg to about 500 mg of the compound, and may be constituted into any form suitable for the mode of administration selected. The dosages, however, may be varied depending upon the requirement of the subjects, the severity of the disease and/or disorder, or associated symptoms or complications thereof, being treated and the compound being employed. The use of either daily administration or post-periodic dosing may be employed.

When the compound of the invention is, for example, put into clinical use, then its dose and its administration frequency may vary depending on the sex, the age, the body weight and the condition of the patient and on the type and the range of the necessary treatment with the compound. For oral administration, in general, the dose of the compound may be in a range of from about 0.01 mg/kg/day to about 100 mg/kg of body weight/day or in a range of from about 0.03 mg/kg/day to about 1 mg/kg/day. The oral administration frequency is preferably from one to a few times per day. For parenteral administration, the dose may be in a range of from about 0.001 mg/kg/day to about 10 mg/kg/day, in a range of from about 0.001 mg/kg/day to about 0.1 mg/kg/day or, in a range of from about 0.01 mg/kg/day to about 0.1 mg/kg/day. The parenteral administration frequency is preferably from one to a few times per day. For oral administration, the compositions are preferably provided in the form of tablets containing from about 1.0 mg to about 1000 mg of the active ingredient, particularly 1 mg, 5 mg, 10 mg, 15 mg, 20 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg, 200 mg, 250 mg, 300 mg, 400 mg, 500 mg, 600 mg, 750 mg, 800 mg, 900 mg, and 1000 mg of the active ingredient for the symptomatic adjustment of the dosage to the patient to be treated. The compounds may be administered on a regimen of 1 to 4 times per day, preferably once or twice per day.

Ordinary physicians, veterinarians and clinicians may readily determine the effective dose of the pharmaceutical compound necessary to treat, prevent, inhibit, retard or stop the intended disease, and may readily treat the diseased patient with the compound.

The pharmaceutical compositions herein will contain, per unit dosage unit, e.g., tablet, capsule, powder, injection, suppository, teaspoonful and the like, of from about 0.001 mg/kg/day to about 10 mg/kg/day (particularly from about 0.01 mg/kg/day to about 1 mg/kg/day; and, more particularly, from about 0.1 mg/kg/day to about 0.5 mg/kg/day) and may be given at a dosage of from about 0.001 mg/kg/day to about 30 mg/kg/day (particularly from about 0.01 mg/kg/day to about 2 mg/kg/day, more particularly from about 0.1 mg/kg/day to about 1 mg/kg/day and even more particularly from about 0.5 mg/kg/day to about 1 mg/kg/day).

Preferably these compositions are in unit dosage forms from such as tablets, pills, capsules, dry powders for reconstitution or inhalation, granules, lozenges, sterile parenteral solutions or suspensions, metered aerosol or liquid sprays, drops, ampoules, autoinjector devices or suppositories for administration by oral, intranasal, sublingual, intraocular,

transdermal, parenteral, rectal, vaginal, dry powder inhaler or other inhalation or insufflation means. Alternatively, the composition may be presented in a form suitable for 1 to 4 times per day, preferably once or twice per day administration; for example, an insoluble salt of the active compound, such as the decanoate salt, may be adapted to provide a depot preparation for intramuscular injection.

The preparation may contain the compound of the invention in an amount in a range of from about 1.0 to about 100% by weight or, in a range of from about 1.0 to about 60% by weight of the preparation. The preparation may contain any other therapeutically-effective compound.

The present invention includes within its scope prodrugs of the compounds of this invention. In general, such prodrugs will be functional derivatives of the compounds which are readily convertible in vivo into the required compound. Thus, in the methods of treatment of the present invention, the term "administering" shall encompass the treatment of the various disorders described with the compound specifically disclosed or with a compound which may not be specifically disclosed, but which converts to the specified compound in vivo after administration to the subject. Conventional procedures for the selection and preparation of suitable prodrug derivatives are described, for example, in "*Design of Prodrugs*", ed. H. Bundgaard, Elsevier, 1985.

Some of the crystalline forms for the compounds may exist as polymorphs and as such are intended to be included in the present invention. In addition, some of the compounds may form solvates with water (i.e., hydrates) or common organic solvents, and such solvates are intended to be encompassed within the scope of this invention.

Where the processes for the preparation of the compounds according to the invention give rise to mixtures of stereoisomers, these isomers may be separated by conventional techniques such as preparative chromatography. The compounds may be prepared in racemic form or as individual enantiomers or diastereomers by either stereospecific synthesis or by resolution. The compounds may, for example, be resolved into their component enantiomers or diastereomers by standard techniques, such as the formation of stereoisomeric pairs by salt formation with an optically active base, followed by fractional crystallization and regeneration of the free acid. The compounds may also be resolved by formation of stereoisomeric esters or amides, followed by chromatographic separation and removal of the chiral auxiliary. Alternatively, the compounds may be resolved using a chiral HPLC column. It is to be understood that all stereoisomers, racemic mixtures, diastereomers, cis-trans isomers, and enantiomers thereof are encompassed within the scope of the present invention.

Additionally, colorants and coatings may be added or applied to the solid dosage form for ease of identification of the drug or for aesthetic purposes. These carriers are formulated with the pharmaceutical active to provide an accurate, appropriate dose of the pharmaceutical active with a therapeutic release profile.

Generally these carriers are mixed with the pharmaceutical active to form a solid preformulation composition containing a homogeneous mixture of the pharmaceutical active form of the present invention, or a pharmaceutically acceptable salt thereof. Generally the preformulation will be formed by one of three common methods: (a) wet granulation, (b) dry granulation and (c) dry blending. When referring to these preformulation compositions as homogeneous, it is meant that the active ingredient is dispersed evenly throughout the composition so that the composition may be readily subdivided into equally effective dosage forms such as tablets, pills and capsules. This solid preformulation composition is then subdivided into unit dosage forms of the type described above containing from about 0.1 mg to about 500 mg of the active ingredient of the present invention. The tablets or pills containing the novel compositions may also be formulated in multilayer tablets or pills to provide a sustained or provide dual-release products. For example, a dual release tablet or pill can comprise an inner dosage and an outer dosage component, the latter being in the form of an envelope over the former. The two components can be separated by an enteric layer, which serves to resist disintegration in the stomach and permits the inner component to pass intact into the duodenum or to be delayed in release. A variety of materials can be used for such enteric layers or coatings, such materials including a number of polymeric materials such as shellac, cellulose acetate (i.e. cellulose acetate phthalate, cellulose acetate trimellitate), polyvinyl

acetate phthalate, hydroxypropyl methylcellulose phthalate, hydroxypropyl methylcellulose acetate succinate, methacrylate and ethylacrylate copolymers, methacrylate and methyl methacrylate copolymers and the like. Sustained release tablets may also be made by film coating or wet granulation using slightly soluble or insoluble substances in solution (which for a wet granulation acts as the binding agents) or low melting solids a molten form (which in a wet granulation may incorporate the active ingredient). These materials include natural and synthetic polymers waxes, hydrogenated oils, fatty acids and alcohols (i.e. beeswax, carnauba wax, cetyl alcohol, cetylstearyl alcohol, and the like), esters of fatty acids metallic soaps, and other acceptable materials that can be used to granulate, coat, entrap or otherwise limit the solubility of an active ingredient to achieve a prolonged or sustained release product.

The liquid forms in which the novel compositions of the present invention may be incorporated for administration orally or by injection include, but are not limited to aqueous solutions, suitably flavored syrups, aqueous or oil suspensions, and flavored emulsions with edible oils such as cottonseed oil, sesame oil, coconut oil or peanut oil, as well as elixirs and similar pharmaceutical vehicles. Suitable suspending agents for aqueous suspensions, include synthetic and natural gums such as, acacia, agar, alginate (i.e. propylene alginate, sodium alginate and the like), guar, karaya, locust bean, pectin, tragacanth, and xanthan gum, cellulose such as sodium carboxymethylcellulose, methylcellulose, hydroxymethylcellulose, hydroxyethylcellulose, hydroxypropyl cellulose and hydroxypropyl methylcellulose, and combinations thereof, synthetic polymers such as polyvinyl pyrrolidone, carbomer (i.e. carboxypolymethylene), and polyethylene glycol; clays such as bentonite, hectorite, attapulgitite or sepiolite; and other pharmaceutically acceptable suspending agents such as lecithin, gelatin or the like. Suitable surfactants include but are not limited to sodium docusate, sodium lauryl sulfate, polysorbate, octoxynol-9, nonoxynol-10, polysorbate 20, polysorbate 40, polysorbate 60, polysorbate 80, polyoxamer 188, polyoxamer 235 and combinations thereof. Suitable defloculating or dispersing agents include pharmaceutical grade lecithins. Suitable flocculating agents include but are not limited to simple neutral electrolytes (i.e. sodium chloride, potassium, chloride, and the like), highly charged insoluble polymers and polyelectrolyte species, water soluble divalent or trivalent ions (i.e. calcium salts, alums or sulfates, citrates and phosphates (which can be used jointly in formulations as pH buffers and flocculating agents). Suitable preservatives include but are not limited to parabens (i.e. methyl, ethyl, n-propyl and n-butyl), sorbic acid, thimerosal, quaternary ammonium salts, benzyl alcohol, benzoic acid, chlorhexidine gluconate, phenylethanol and the like. There are many liquid vehicles that may be used in liquid pharmaceutical dosage forms; however, the liquid vehicle that is used in a particular dosage form must be compatible with the suspending agent(s). For example, nonpolar liquid vehicles such as fatty esters and oils liquid vehicles are best used with suspending agents such as low HLB (Hydrophile-Lipophile Balance) surfactants, stearylalcohol hectorite, water insoluble resins, water insoluble film forming polymers and the like. Conversely, polar liquids such as water, alcohols, polyols and glycols are best used with suspending agents such as higher HLB surfactants, clays silicates, gums, water soluble cellulose, water soluble polymers and the like. For parenteral administration, sterile suspensions and solutions are desired. Liquid forms useful for parenteral administration include sterile solutions, emulsions and suspensions.

Isotonic preparations which generally contain suitable preservatives are employed when intravenous administration is desired.

Furthermore, compounds of the present invention can be administered in an intranasal dosage form via topical use of suitable intranasal vehicles or via transdermal skin patches, the composition of which are well known to those of ordinary skill in that art. To be administered in the form of a transdermal delivery system, the administration of a therapeutic dose will, of course, be continuous rather than intermittent throughout the dosage regimen.

Compounds of the present invention can also be administered in the form of liposome delivery systems, such as small unilamellar vesicles, large unilamellar vesicles, multilamellar vesicles and the like. Liposomes can be formed from a variety of phospholipids, such as cholesterol, stearylamine, phosphatidylcholines and the like.

The daily dose of a pharmaceutical composition of the present invention may be varied over a wide range from about 0.1 mg to about 5000 mg; preferably, the dose will be in the range of from about 1 mg to about 100 mg per day for an average human. For oral administration, the compositions are preferably provided in the form of tablets containing, 0.01, 0.05, 0.1, 0.5, 1.0, 2.5, 5.0, 10.0, 15.0, 25.0, 50.0, 100, 150, 200, 250 or 500 milligrams of the active ingredient for the symptomatic adjustment of the dosage to the subject to be treated. Advantageously, a compound of the present invention may be administered in a single daily dose or the total daily dosage may be administered in divided doses of two, three or four times daily.

It is also apparent to one skilled in the art that the therapeutically effective dose for active compounds of the invention or a pharmaceutical composition thereof will vary according to the desired effect. Therefore, optimal dosages to be administered may be readily determined by those skilled in the art, and will vary with the particular compound used, the mode of administration, the strength of the preparation, and the advancement of the disease condition. In addition, factors associated with the particular subject being treated, including subject age, weight, diet and time of administration, will result in the need to adjust the dose to an appropriate therapeutic level. The above dosages are thus exemplary of the average case. There can, of course, be individual instances where higher or lower dosage ranges are merited, and such are within the scope of this invention.

Compounds of this invention may be administered in any of the foregoing compositions and dosage regimens or by means of those compositions and dosage regimens established in the art whenever use of the compounds of the invention as FLAP modulators is required for a subject in need thereof.

In their use, the compounds of the invention may be combined with any other therapeutic agents that are useful for the treatment of an FLAP-mediated disorder.

The combination includes not only the composition of compounds of the invention and one other active substance but also the composition of compounds of the invention and two or more other active substances or non-drug therapy. The scope of possible combinations of a compound of the invention and one, two or more active substances are within the knowledge of one skilled in the art for the treatment of an FLAP-mediated disorder.

Specifically, the combination of a FLAP modulator with prostaglandin modulators, cyclooxygenase-1 modulators, or cyclooxygenase-2 modulators might be used to treat inflammatory and autoimmune diseases and/or disorders as well as cardiovascular diseases and/or disorders, or vascular injury

(Z. Yu et al., "Disruption of the 5-lipoxygenase pathway attenuates atherogenesis consequent to COX-2 deletion in mice," *Proc. Natl. Acad. Sci. USA*, 2012, 109(17), 6727-32; Z. Yu et al., "Myeloid Cell 5-Lipoxygenase Activating Protein Modulates the Response to Vascular Injury," *Circ. Res.*, 2012, Epub December 18). Due to the synergy of histamine and leukotrienes, the combination of a FLAP modulator and a histamine receptor 1 or 4 antagonist might have utility in treating respiratory, allergic, dermatological and autoimmune disorders (A. Reicin et al., "Montelukast, a leukotriene receptor antagonist, in combination with loratadine, a histamine receptor antagonist, in the treatment of chronic asthma," *Arch. Intern. Med.*, 2000, 160(16), 2418-88; S. Sanada et al., "The effectiveness of montelukast for the treatment of anti-histamine-resistant chronic urticaria," *Arch. Dermatol. Res.*, 2005, 297(3), 134-38).

Formulations

To prepare the pharmaceutical compositions of this invention, one or more compounds of Formula (I) or salt thereof as the active ingredient, is intimately admixed with a pharmaceutical carrier according to conventional pharmaceutical compounding techniques, which carrier may take a wide variety of forms depending of the form of preparation desired for administration (e.g. oral or parenteral). Suitable pharmaceutically acceptable carriers are well known in the art. Descriptions of some of these pharmaceutically acceptable carriers may be found in *The Handbook of Pharmaceutical Excipients*, published by the American Pharmaceutical Association and the Pharmaceutical Society of Great Britain.

The compounds of the present invention may be formulated into various pharmaceutical forms for administration purposes. Methods of formulating pharmaceutical compositions have been described in numerous publications such as *Pharmaceutical Dosage Forms: Tablets, Second Edition, Revised and Expanded*, Volumes 1-3, edited by Lieberman et al; *Pharmaceutical Dosage Forms: Parenteral Medications*, Volumes 1-2, edited by Avis et al; and *Pharmaceutical Dosage Forms: Disperse Systems*, Volumes 1-2, edited by Lieberman et al; published by Marcel Dekker, Inc.

F) Biological Examples

The ability of the compounds of the present invention to treat a FLAP-mediated disease and/or disorder, or associated symptoms or complications thereof, was determined using the following procedures. Binding assay data represent the average value obtained from two different assay plates, with samples run in duplicate on each plate. Human whole blood assay data represent a single replicate on an assay plate using whole blood from at least one healthy donor. Certain FLAP binding and human whole blood assay data is presented in Table 2.

FLAP Binding Assay

The assay below is used to test the modulatory activity of compounds against FLAP. Human and mouse FLAP-encoding DNA was amplified by polymerase chain reaction and cloned into pFastBac1 (Invitrogen) with a NH₂-terminal 6-His tag for expression in *Spodoptera frugiperda* (Sf-9) cells. FLAP-containing membranes were prepared as was a FITC-labeled FLAP modulator (3-(3-(tert-butylthio)-1-(4-chlorobenzyl)-5-(quinolin-2-ylmethoxy)-1H-indol-2-yl)-2,2-dimethylpropanoic acid). The FLAP binding assay is performed in HTRF format (homogeneous time resolved fluorescence). FLAP-containing membranes (1 µg/well final for human) are incubated in the presence of the HTRF ligand, [5-[(2-(2-{3-[3-(tert-butylsulfanyl)-1-(4-chlo-

robenzyl)-5-(quinolin-2-ylmethoxy)-1H-indol-2-yl]-2,2-dimethylpropanoyl}hydrazino)-2-oxoethyl]sulfanyl}acetyl] amino]-2-(6-hydroxy-3-oxo-3H-xanthen-9-yl)benzoic acid] (25 nM final), a terbium labeled anti-His tag antibody (0.5 ng/well final, from Cisbio) and compounds. The reaction is allowed to proceed for two hours after which the plate is read on an Envision plate reader in HTRF mode. Data are expressed as a HTRF ratio.

For human FLAP binding assays, data are analyzed with 3DX Explorer software. A ratio is calculated with the relative light units at 520 nm over the relative light units at 495 nm. For analysis, data from multiple runs are averaged and each compound may be tested in 2 to 20 runs. Each run comprises two plates and each plate includes duplicates. Data from each plate is averaged and data are imported into 3DX. The data from multiple runs are aggregated as the average of duplicates of the calculated ratios in order to calculate K_i and IC₅₀ values. Numbers in parentheses are the number of runs for the assay.

Human Whole Blood Assay

An in vitro cellular assay was performed using human whole blood collected in heparin-containing tubes, which was used to test the ability of compounds to modulate the leukotriene pathway in human whole blood. The blood was diluted 1:1 in RPMI medium, pre-incubated for 15 min at 37° C. with test compounds at various concentrations, and then stimulated with calcium ionophore, A23187 (7 µg/mL), for 30 min at 37° C. The samples were then centrifuged and plasma was removed. The plasma was diluted in assay buffer and LTB₄ levels were measured using a commercial kit (Enzo Life Sciences). The concentration of each compound that was required for half-maximal inhibition (modulation) of recombinant enzyme activity (IC₅₀) was calculated by a 4-parameter equation using the program GraphPad Prism (GraphPad software). Where duplicate assays were performed by the same team, the values were averaged. Numbers in parentheses are the number of runs for the assay.
