(57) **ABSTRACT**

A multi-function wallet is provided which is adapted in one mode for carrying and storage of non-flat items concurrently with and conventional flat items. Additionally the wallet or an engaged stand component is configured to securely yet removably engage a computing device with a viewable screen such as a smartphone, and hold it at multiple angles while in an inclined position so as to be easily viewable by a user.

MULTI-FUNCTION WALLET

This application claims priority to U.S. Provisional Patent Application Ser. No. 61/974,247 filed on Apr. 2, 2014, and by this reference includes herein the entire specification and all drawings therefrom.

BACKGROUND OF THE INVENTION**1. Field of the Invention**

The present invention relates generally to billfolds, wallets and storage containers of the like. More particularly the invention relates to a multi-function wallet device providing a pocket-positioned container for carrying and storage of currency and conventional flat items. Additionally, the disclosed device is adapted for removable engagement to digital media devices such as a smartphone or pad, and function as a support for holding the media device and adjusting it to any of a plurality of viewing angles using a support which also may be removably engaged to the wallet.

2. Prior Art

It is conventionally known that wallets are often limited on storage space, due to the fact that such wallets need to fit into pockets of limited size. The storage space provided by today's currently available wallet designs typically only allow for the storage of flat objects such as cash, cards, & coins, and conventionally do not easily store bulky, non-flat items if at all. For example, if a user were to store a non-flat item such as a tube of lipbalm, a wireless earphone device, headphones, batteries, and the like inside a conventional wallet, it would not only add bulk and thickness to the wallet, but it would also become oddly shaped and uncomfortable in the users pocket. In addition, these items placed in a conventional wallet are also likely to get broken under pressure, while they're being sandwiched between other hard surfaced items stored in the wallet like credit cards, ID cards, and the like.

Current wallet designs provide users with some storage option typically by forming the wallet in one of two configurations being three-fold, or two-fold type configurations. Briefly, a three-fold wallet typically comprises three planar portions of material engaged side to side having foldable portions acting as hinges communicating between adjacent planar portions. Therefore a three-fold wallet typically has two fold portions, or hinges. This allows the wallet to fold into a volume having a length and width the size of one of the three portions.

A two-fold, or 'bi-fold' wallet generally comprises two planar portions of material which fold together along a common centerline typically being a hinge. Therefore a two-fold wallet comprises a single hinge area.

In addition to wallets, many individuals also carry digital media devices such as cellphones, smartphones, pad computers and similar electronic devices having a video display. Such electronic accessories tend to further clutter the already limited space of a users pocket. As a result, some art has been driven to teach the provision of wallet devices which are additionally configured to hold and secure a smartphone, as well as conventional flat items such as credit cards, ID cards, and cash, in a single unit.

An example of such a device can be found in U.S. Pat. Pub. No. 2011/0089077 to Ziemba, and others. This and similar devices typically securely engage the smartphone into the wallet device in a permanent manner. In addition, a particular feature about such devices is that they often allow the wallet device to be used as a stand to prop smartphone in a position for viewing when desired.

However, aside from the few benefits, the intentional permanent engagement of the smartphone type devices to the wallet creates multiple problems. For example the wallet is substantially larger & bulkier when inserted into a pocket because the smartphone is always included. Further this increase in bulk results in less storage space and can be painful when sat upon for long periods. Additionally, when the user wishes to use the phone the entire wallet device must be removed from a pocket. Such constant removal can result in items in the wallet dislodging while using the phone. Still further losing the wallet permanently engaged to the phone, will always result in loss of the users phone and vice versa.

Further, the prior art generally allows positioning the smartphone into a horizontal viewing position and such do not provide any structure for adjusting viewing angles. Still further, the prior art fails to provide a phone support which is disengageable from the wallet itself and which may also be employed as a smaller carrying device for cash and credit cards which may be employed to position the phone to various viewing angles.

As a result, there is a continuing unmet need for a multi-function wallet device which provides for carrying and storage of non-flat items and conventional flat items, and is adapted for securely yet removably engaging digital media devices such as a smartphones using a permanently engaged support or a removable support functioning as a carrying case. Such a device should provide support for holding the digital media device in a manner that is adjustable to a plurality of viewing angles for the user. By allowing the digital media device to be removably engaged from the wallet device, either using a permanent removable engaging component, or a removable support attachable to the wallet, excessive wallet bulk is eliminated while still maintaining the full amount of storage provided by the device; the items stored in the wallet can be accessed while the phone is used; and if the smartphone is lost, the wallet is not.

The forgoing examples of related art and limitation related therewith are intended to be illustrative and not exclusive, and they do not imply any limitations on the invention described and claimed herein. Various limitations of the related art will become apparent to those skilled in the art upon a reading and understanding of the specification below and the accompanying drawings.

SUMMARY OF THE INVENTION

The device herein disclosed and described provides a solution to the shortcomings in prior art and achieves the above noted goals through the provision of a multi-function wallet device which utilizes a conventionally unused portion of a typical folding wallet configuration as a means for carrying and storage of non-flat items. In accordance with preferred modes, the device comprises a main body which is configured generally as either a three-fold, or two-fold type wallet, wherein the means for storage of non-flat objects is provided by at least one storage compartment located in an engagement with at least one of the hinges of the main body of the device.

The storage compartment can be permanently engaged or removably engaged from the main body of the wallet device. Preferred means for removable engagement is one or a plurality of zip fasteners, however other suitable means for removable engagement may be employed and are anticipated. For example, hook and loop fabric, magnets, or snap fit fasteners may be employed.

The various components of the device disclosed herein can be formed of conventional materials such as leather, vinyl, faux leather, cloth, or fabric however can be formed of any material suitable for the purposes set forth in this disclosure. It is additionally noted that the device being generally in the shape of a conventional wallet, may be constructed from conventional methods, without implying any limitations thereon, wherein sections of material are engaged via known techniques such as sewing, stitching, welding, adhesives, or any other suitable method of construction.

In all modes, the storage compartment becomes an unhindered usable storage space. By utilizing the full storage potential of this unique storage compartment, in both removable and permanently engaged modes of supporting a smartphone or pad device, the device in one mode allows the user to now safely store & carry larger non-flat objects, such as; earbud style headphones, wireless earphone devices, phone chargers, thumb drives, lip balm, etc. In addition, in at least one preferred mode, the storage compartment may be configured with built-in speakers for connection to a digital media device to enhance the sound of the digital media device. Further, the support for positioning the smartphone to multiple viewing angles may be provided as permanently engaged to the wallet, or as a separable support with storage for both cash and credit cards.

As an advantage over prior art, the provision of a storage compartment engaged to a hinge of the wallet body, allows the main body of the wallet to be employed for cash and card storage as is typically found in conventional wallets, while allowing the hinge to extend into a unique storage compartment, without adding substantial overall bulk to the wallet. Upon a further reading of this disclosure, one skilled in the art will immediately recognize these and similar advantages of the present invention over conventional wallets and those found in prior art.

Firstly, since the storage compartment is located at the end of the wallet at one of the hinges, rather than inside the main body of the wallet, when items are placed inside the compartment they are typically not sandwiched between hard surfaced items in the wallet and thus are less likely to be broken. In addition, the location of the storage compartment allows the wallet to maintain a thin profile because there are no additional items surrounding it, adding unnecessary bulk as outlined earlier. Further, items can be removed or put into the compartment quickly and easily via an exterior zipper access or other means for accessing the storage compartment while the main body of the wallet is in the closed position. This provides added security for the user since the chance of other items dislodging or falling from the wallet is substantially reduced.

Still further, in modes of the device employing a removably engageable storage compartment, the user is provided with the choice to either expand the storage capacity of the wallet or to minimize it for a sleeker smaller look and fit by removing it. For example, the user may choose to leave the wallet behind at times to say carry the compartment with headphones inside, into the gym, while leaving their wallet in the car.

In accordance with a first particularly preferred mode of the multi-function wallet device, the main body of the device is configured as a two-fold type wallet configuration, and having a third folding body employed to store various components of the device including a wallet support member and car headrest engagement means to be described in more detail below. A removable storage compartment as

described previously is additionally employed and is removably engaged to at least one hinge as outlined above.

Means for securely yet removably engaging a digital media device is provided by one or a plurality of support wings. Elastic support straps engaged to the support wings are preferably employed for securing the digital media device to the support wings. With the digital media device securely engaged to the support wings, the wallet body is then configurable into one of a plurality of stand modes (described in more detail later) thereby providing the means for holding the digital media device at a plurality of viewing angles. In at least one stand mode, the device can be supported on a table or other surface in vertical or horizontally disposed positions, to prop the digital media device into a desirable viewing angle.

Further, additional means for holding the digital media device at a plurality of angles are provided by car seat headrest & sun visor engagement means which allows the wallet device to be hung from a plurality of different locations for optimal viewing of the digital media device engaged thereon. For example, the car seat headrest engagement means allows the device to be supported from the rear of a conventional headrest of a passenger vehicle, for viewing by a rear seated passenger.

A support strap is preferably provided as a sun visor engagement means, which may allow the device to be engaged to many items, such as a visor in the interior of a vehicle for use with a GPS digital media device, however additionally provides a means for hanging the device from any desired location, such as a door handle for viewing of the digital media device. Therefore the engagement of the strap to the desired location will additionally provide a means for holding the digital media device as needed.

Further, means for carrying and storage of conventional flat items are provided by one or a plurality of cash compartments of the main body and one or a plurality of card holding compartments employed for storing conventional flat items such as cash, receipts, credit cards, ID cards, debit cards, etc. In addition, anti-slip retainer means may be employed in combination with the card holding compartments which provides a means for enhancing the frictional engagement of flat items within the card holding compartments. This will provide added security of such items held within the device, and are an especially preferred feature.

The device in the current mode provides all the features typically found in a conventional wallet such as; cash & card storage, with the added utility to transform the wallet device into a sturdy digital media device stand which works both in the horizontal & vertical positions. In the horizontally positioned stand mode, the wallet device is configured with retainer straps employing hook and loop fasteners for securing the device into the stand configuration. The retainer straps can be selectively adjusted to vary shape of the device and therefore the disposition of the operatively engaged digital media device as a means for adjusting the viewing angle to give the user greater flexibility while viewing the digital media device at varying angles. In addition, as noted previously, the storage compartment may be employed to protect and contain accessories, including headphones or other small electronics, keeping them neatly wound for easy removal when desired.

In yet another particularly preferred mode of the device, the main body is of a three-fold type configuration. This mode may be configured with one or any suitable combinations of the features of the previously described mode of the invention, as deemed suitable by the designer to provide means for carrying and storage of non-flat items and con-

5

ventional flat items, means for securely yet removably engaging digital media devices, means for holding the digital media device at a plurality of viewing angles, and means for adjusting the viewing angle. A more complete description of this mode will be provided later.

Before explaining any further preferred modes of the invention, it is to be understood that the aspects and features described in any of the preferred modes may be used singularly or in any combination as deemed suitable by the designer. Therefore those skilled in the art will recognize the plurality of different combinations and configurations of the described features which can be carried out in the construction of the device.

With that being said, in additional particularly preferred modes of the present invention, the main body of the device is configured as a two-fold, or 'bi-fold' type wallet. These modes also preferably include means for carrying and storage of non-flat items and conventional flat items, means for securely yet removably engaging digital media devices, means for holding the digital media device at a plurality of viewing angles, and means for adjusting the viewing angle. Storage of non-flat items are preferably provided by a permanently engaged storage compartment disposed on the single hinge of the two-fold main body. Permanent engagement means may include stitching, sewing, or other suitable means. The storage compartment may have compartment access means from any one or both of the exterior and interior portions of the wallet device, which allows the user to easily retrieve items from the storage compartment as needed. Compartment access means may include openable zip fasteners, hook and loop fasteners, snap fits fasteners, or other suitable means. A more complete description of this mode will be provided in the detailed descriptions of the preferred modes of the invention shortly below.

It is briefly noted that upon a reading this disclosure, those skilled in the art will recognize various means for carrying out these intended features of the invention. As such it is to be understood that other devices which are slightly or moderately modified from the preferred modes may be configured to carry out these features and are therefore considered to be within the scope and intent of the present invention, and are anticipated.

With respect to the above description, before explaining at least one preferred embodiment of the herein disclosed invention in detail, it is to be understood that the invention is not limited in its application to the details of construction and to the arrangement of the components in the following description or illustrated in the drawings. The invention herein described is capable of other embodiments and of being practiced and carried out in various ways which will be obvious to those skilled in the art. Also, it is to be understood that the phraseology and terminology employed herein are for the purpose of description and should not be regarded as limiting.

As such, those skilled in the art will appreciate that the conception upon which this disclosure is based may readily be utilized as a basis for designing of other structures, methods and systems for carrying out the several purposes of the present disclosed device. It is important, therefore, that the claims be regarded as including such equivalent construction and methodology insofar as they do not depart from the spirit and scope of the present invention.

As used in the claims to describe the various inventive aspects and embodiments, "comprising" means including, but not limited to, whatever follows the word "comprising". Thus, use of the term "comprising" indicates that the listed elements are required or mandatory, but that other elements

6

are optional and may or may not be present. By "consisting of" is meant including, and limited to, whatever follows the phrase "consisting of". Thus, the phrase "consisting of" indicates that the listed elements are required or mandatory, and that no other elements may be present. By "consisting essentially of" is meant including any elements listed after the phrase, and limited to other elements that do not interfere with or contribute to the activity or action specified in the disclosure for the listed elements. Thus, the phrase "consisting essentially of" indicates that the listed elements are required or mandatory, but that other elements are optional and may or may not be present depending upon whether or not they affect the activity or action of the listed elements.

The objects features, and advantages of the present invention, as well as the advantages thereof over existing prior art, which will become apparent from the description to follow, are accomplished by the improvements described in this specification and hereinafter described in the following detailed description which fully discloses the invention, but should not be considered as placing limitations thereon.

BRIEF DESCRIPTION OF DRAWING FIGURES

The accompanying drawings, which are incorporated herein and form a part of the specification, illustrate some, but not the only or exclusive, examples of embodiments and/or features. It is intended that the embodiments and figures disclosed herein are to be considered illustrative rather than limiting. In the drawings:

FIG. 1 shows a view of a first preferred mode of the device, having a two-fold type main body with a third folding body engaged thereto, and including compartments for carrying and storage of non-flat items and conventional flat items, means for securely yet removably engaging digital media devices, and components enabling support for the digital media device at a plurality of viewing angles, and means for adjusting the viewing angle.

FIG. 2 shows the main body of the device of FIG. 1 in an open position, with the third folding body in the closed position, and depicting the removably engageable storage compartment.

FIG. 3 shows the main body of the device of FIG. 1 in an open position, and showing a third folding body also in an open position.

FIG. 4 depicts the device of FIG. 1 in a particularly preferred stand mode, providing a component for holding a digital media device at a plurality of viewing angles.

FIG. 5 shows the device of FIG. 1 in a depiction showing the car headrest engagement component of FIG. 3 and FIG. 5 in a deployed position.

FIG. 6 shows a view of another particularly preferred mode of the device, having a three-fold type main body and compartments for carrying and storage of non-flat items and conventional flat items, and securement for removably engaging digital media devices which may be adjusted to a plurality of viewing angles.

FIG. 7 shows the device of FIG. 6 with the various components such as the hanging or headrest attachment deployed for use.

FIG. 8 shows a view of a first particularly preferred mode of the device, having a two-fold type main body and including compartments for carrying and storage of non-flat items and conventional flat items and components for engaging digital media devices which allows for adjustment to a plurality of viewing angles.

FIG. 9 shows the device of FIG. 8 in an open position revealing the interior of the device.

7

FIG. 10 depicts the device of FIG. 8 configured to a support or stand mode, providing means for holding a digital media device at a plurality of viewing angles.

FIG. 11 shows a view of yet another preferred mode of the wallet device wherein a base positioned storage compartment is configured to receive a rigid container.

FIG. 12 shows a view of another mode of the rigid container having a cutout portion which aligns with the zipper access.

FIG. 13 shows still yet another mode of the rigid container employing an inner sleeve portion formed integrally with the cap, for storing fragile items.

FIG. 14 shows yet another preferred mode of the device employing exterior card holder compartments arranged in a staggered configuration. Also included is a transparent card holder for ID's.

FIG. 15 depicts the wasted space of conventional wallets lacking the conformability of the device herein.

FIG. 16 shows a wallet according to the device herein, following the natural curve of the leg of a user, with wasted space below or above ends of wallet.

FIG. 17 shows a wallet of the device herein with a lower planer compartment slightly shortened.

FIG. 18 The lower planer compartment has been shortened by approximately 1/2 inch.

FIG. 19 depicts a series of views of another preferred mode of the device having a multiple compartment wallet and engageable support for a smartphone or the like for angled positioning.

FIG. 20 shows a second series of views of the device of FIG. 19 where the stand is removable from the wallet body and configurable to hold the smartphone or computing device in an inclined position to a mid portion of the body of the stand.

FIG. 21 depicts the device of FIGS. 19 and 20 wherein the wallet is engaged to the stand while forming the support for the smartphone or planar computing device to an inclined angled position.

FIG. 22 shows a series of views of the device of FIGS. 20 and 19 where it is configured between a closed position for pocket engagement and an open position.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS OF THE INVENTION

In this description, the directional prepositions of up, upwardly, down, downwardly, front, back, top, upper, bottom, lower, left, right and other such terms refer to the device as it is oriented and appears in the drawings and are used for convenience only; they are not intended to be limiting or to imply that the device has to be used or positioned in any particular orientation.

Now referring to drawings in FIGS. 1-22, wherein similar components are identified by like reference numerals, there is seen in FIGS. 1-5, views of one particularly preferred mode of the device 10 comprising a main body 12 which is configured as a two-fold type wallet device 10. The body 12 generally includes first 14 and second 16 planar portions of material which fold together along a common centerline defined by a formed hinge 18 type engagement formed of material or fabric similar to the body 12.

Also shown a second carrier or third folding body 20 is provided and communicates with the second planar portion 16 via a common centerline also defined by a hinge 22. It is noted that the hinge 22 may include means for removable engagement thereby allowing the third folding body 20 to be

8

removed from the main body 12 if desired by the user. Further, it should be noted that the device 10 may be configured to allow the third folding body 20 to be removed with or without the compartment 36 as deemed suitable by the designer. Means for removable engagement can include zip fasteners, hook and loop fasteners, magnet fasteners, snaps, or any other suitable fasteners as would occur to those in the art.

It is noted that in all preferred modes, the device 10 comprises one or any suitable combination of means for carrying and storage of non-flat items and conventional flat items, means for securely yet removably engaging digital media devices such as a smartphone, means for holding the digital media device at a plurality of viewing angles, and means for adjusting the viewing angle. The various components of the device 10 employed for carrying out these features are described in more detail below. It is noted that those skilled in the art may recognize various other means for similarly carrying out these features which may differ in construction from the preferred modes, however without departing from the scope and intent of the present invention these modification are anticipated.

In a current mode, the means for storage of non-flat objects is provided by at least one non-flat item storage compartment 36 located in an engagement with at least one of the hinges engaged to the main body 12 of the device 10. Currently, the storage compartment 36 is shown to be removably engageable to the hinge 22 communicating between the second planar body 16, and third folding body 20. The storage compartment 36 is preferably removably engageable from the main body 12 of the wallet device 10 wherein preferred means for removable engagement is one or a plurality of zip fasteners 40. However other suitable means for removable engagement may be employed and are anticipated. For example, hook and loop fabric, magnet fasteners, or snap fit fasteners may be employed.

The various components of the device 10 disclosed herein can be formed of conventional materials such as leather, vinyl, faux leather, cloth, or fabric however can be formed of any material suitable for the purposes set forth in this disclosure. It is additionally noted that the device 10 being generally in the shape of a conventional wallet, may be constructed from conventional methods, without implying any limitations thereon, wherein sections of material are engaged via known techniques such as sewing, stitching, welding, adhesives, staples, rivets, or any other suitable method of construction. Further, it is anticipated that the device 10 may employ portions of RFID blocking material to protect the magnet strips employed on conventional credit and ID cards.

It is the intent of removable storage compartment 36 to provide the user with greater flexibility of use of the wallet device 10 by allowing them to either attach or remove the compartment 36 to the hinge 22 of the wallet 10. Thus the user can choose to have increased storage capacity with the compartment 36 or remove it if so desired to streamline the overall volume of the wallet 10. The storage compartment 36 in all modes provides a location to store non-flat items which will be well protected and neatly contained, so they won't easily get lost falling out of their pocket when removing the device 10, unlike other conventional and prior art wallets. Items can be placed in the compartment 36 by unzipping the front zipper 38. However, in other modes not particularly shown, the location of this compartment 36 may include, but are not limited to; a reverse layout of the current depictions with the compartment 36 on the right side; and

the inside hinge **18** between the first **14** and second **16** planar portions, and others deemed suitable by the designer.

Again, other means for removable engagement of the compartment **36** may include, but are not limited to; hook and loop fabric, tongue & groove, buttons, magnets, and fasteners of the like. In addition, the interior space (not shown) within the compartment **36** may be divided into different compartments internally by placing dividers inside to separate the sections. One or a plurality of zippers, snaps, or other fasteners on the outside could access these independent compartments if desired.

Means for securely yet removably engaging a digital media device **1000** is currently provided by one or a plurality of support wings **48**. The support wings **48** are preferably engaged to the main body **12** of the wallet device **10**, however in other modes may be engaged to the second carrier provided by the third folding body **20** if deemed suitable by the designer, and provide a means for securely yet removably engaging digital media devices **1000** such as smartphones, media players, music players, GPS devices, and the like. It is noted that in any of the preferred modes of the invention herein, the support wings **48** may be removably engageable via hook and loop fasteners, magnets, clips, or other suitable removable fasteners for the task.

Elastic support straps **50** engaged to the support wings **48** are preferably employed for securing the digital media device **1000** to the support wings **48** as shown in one of the preferred as used stand modes in FIG. **4**. In at least one preferred mode, the elastic support straps **50** may be removably engageable to the support wings **48** thereby allowing the user to replace the straps should the elastic become worn.

With the digital media device **1000** securely engaged to the support wings **48**, the wallet body **12** can be configured into one of a plurality of stand modes (FIG. **4** and FIG. **5**) which can be supported on a table or other surface in vertical or horizontally (FIG. **4**) disposed positions, to prop the digital media device **1000** into a desirable viewing angle as is clearly shown in the FIG. **4**, thereby providing the means for holding the digital media device at a plurality of viewing angles. It is noted that a vertical disposition of the digital media device **1000** can be easily accomplished simply by rotating the device **10** 90 degrees in either direction.

Further, in FIG. **4**, those skilled in the art will immediately recognize that the means for varying the viewing angle is provided by adjusting the triangular formation, as shown. This is preferably accomplished by selectively adjusting the positioning of the retainer strap **34** in an engagement with the loop fabric portion **30**. For example, by engaging the retainer strap **34** to the loop fabric **30**, closer to the hinge **22**, the triangular configuration will be wider, therefore providing a flatter viewing angle of the operatively engaged digital media device **1000**. Alternatively, by engaging the retainer strap **34** on the loop portion **30** adjacent the distal end of the first portion **14**, the triangular form will be tighter, thereby providing a more vertical viewing angle of the digital media device **1000**.

A particularly preferred feature of the device **10** is to have the support wings **48** stealthily hidden under the third folding body **20**, however can be quickly and easily opened up by simply tearing free a retainer strap **32** to allow the third body to rotate to an open position (FIG. **3**). The retainer strap **32** may employ hoop fabric while loop fabric may be engaged at the complimentary portion of the third body **20** for securing it thereto. Alternatively, magnets, snap fits, or other suitable fasteners may also be employed, and are anticipated.

When the support wings **48** are retracted and opened up and the wallet device **10** is secured in the triangular or wedge shape formation as shown in FIG. **4** to provide a means for holding the digital media device at a plurality of viewing angles, these preferably ridged support wings **48** employing elastic support straps **50**, hold the digital media device **1000** firmly in place. It is noted that other means for securing the digital media device **1000** to the wallet device **10** may be employed and are anticipated. For example, other means may include, but are not limited to: employing hook and loop fabric on the support wings **48** and or wallet surface and back of the digital media device **1000**; the employment of magnets, tongue and groove fasteners, hook & loop fasteners.

Further, in regards to the currently shown mode, more than one row of elastic straps **50** may be employed to accommodate even larger size digital media storage devices **1000**. Still further, in yet other modes however not particularly shown, the wallet device **10** could be configured with speakers built into each support wing **48** on the outside of the strap **50**. These speakers would have a wired or wireless communication means connecting them that would communicate with a digital media device **1000** to enhance the sound of the device **1000**. For example, near field communication (NFC), Bluetooth, wifi, or other suitable wireless communications means may be employed to communicate audio signals to the speakers.

However, it is noted that the location of the speakers may vary as determined by the designer, for example, the one or both of the speakers and/or power source (rechargeable or removable battery) could be in an engagement with the storage compartment **36**.

Further, a car seat headrest & sun visor engagement means are additionally provided which allows the wallet device **10** to be hung from a plurality of different locations for optimal viewing of the digital media device **1000** engaged thereon. For example, shown in FIG. **5**, the car seat headrest engagement means depicted as clip **26** allows the device **10** to be supported from the rear of a conventional headrest by strap member **27** passenger vehicle, for viewing by a rear seated passenger. In use the clip **26** is slide between a headrest and seat and then turned to a vertical disposition wherein it contacts the seat and headrest. The strap member **27** hands toward the bottom of the seat back, and supports the device **10** and any smartphone or similar component engaged.

A support member **28** is preferably provided which can be selectively engaged to an additional retainer strap **34**, each respectively employing hook and loop fasteners or other suitable adjustable fasteners, and the provision of a loop fabric portion **30**, or other suitable fastener, in the interior side surface of the third folding body **20**, for forming the triangulated or wedge shape as needed for optimal viewing of the digital media device **1000**.

It is noted that those skilled in the art will immediately recognize that the means for varying the viewing angle of the digital media device **1000** in the current mode is provided by varying the wedge or triangular shape of the device **10**. Currently, the triangular shape is provided by an engagement of the support member **28** to the retainer strap **34**. Therefore, by adjusting the position of the support member **28**, and widening or tightening the angles forming the triangular shape shown, the user is provided with a means for adjusting the viewing angle of the digital media **1000** on the device **10**. For example, with the retainer strap **34** engaged to the support member **28** at or near the distal buckle end **29**, the triangular shape is lengthened, and the

11

digital media device **1000** is positioned at a more vertical viewing angle. Alternatively, by engaging the retainer strap **34** to the strap **28** closer to the hinge **22**, the triangular shape is tightened, and a flatter viewing angle is provided.

Engagement to a sun visor can be accomplished by communicating the support member **28** through the aperture **23** of the hinge **22**, and placing the device **10** on the inside of a sun visor and wrapping the strap **28** around it to an engagement with the retainer strap **34**.

In addition the strap **28** may also be employed to allow the device **10** to be hung from any desired location, for example a visor, door handle, or the like, for viewing of the digital media device **1000** as needed. For example, the distal end of the strap **28** can be looped around a door handle or other location, and the buckle **29** can be employed to secure the strap **28** back on itself.

Currently, one or a plurality of additional compartments **24** can be provided in the third folding body **20** which provides a storage means for the car headrest engagement means **26** and support member **28**. As can be seen, an aperture **23** formed in the hinge **22** can be employed for communicating the strap **28** to the exterior of the device **10** for hanging the device **10** via the strap **28** from any location deemed suitable by the user.

Means for carrying and storage of conventional flat items are provided by a cash compartment **42** extending the length of the main body **12** as shown, and one or a plurality of card holding compartments **44** (in the form of slots) employed for storing conventional flat items such as cash, credit cards, ID cards, debit cards, etc.

Anti-slip retainer means **46** are preferably employed within or in combination with the card holding compartments **44**. The addition of frictionally enhancing material to the inside of card holding compartments **44** or other locations where flat objects such as cards come in direct contact with the device, helps maintain the cards in registered engagement and properly positioned therein. Such frictionally enhancing material say for example rubber or PVC, could either be placed inside the storage bays or card holding compartments or at other locations where the cards come in direct contact with the wallet device herein. Such anti slip material could also be directional if needed, so as to provide a means to allow cards to slide in easily when storing them, but rendering them harder to pull out or dislodge.

The anti-slip retainer means **46** in the current mode are provided by engaging an elongated portion of high friction material such as rubber, or neoprene, or other fabric or material, at or near the opening of the compartments **44** which provides a means for enhancing the frictional engagement of flat items when they are slid into the card holding compartments **44**. This will provide added security of such items held within the device **10**, and are an especially preferred feature.

An ID compartment **52** is also preferably provided. This compartment **52** comprises a transparent viewing window **53** providing a means to display an operatively inserted ID card without the need to remove it. This is generally considered a conventional feature in many prior art wallets commercially available today. It is noted that in other modes the ID compartment **52** may be engaged to any one or suitable combination of the first **14** and second **16** planar members, or the third folding body **20** as deemed suitable by the designer.

FIG. **6** and FIG. **7** show yet another particularly preferred mode of the device **10** also configured with one or any suitable combinations of means for carrying and storage of non-flat items and conventional flat items, means for

12

securely yet removably engaging digital media devices, means for holding the digital media device at a plurality of viewing angles, and means for adjusting the viewing angle. The main body **55** of the current mode is of a three-fold type configuration, comprising a first planar portion **54**, a second planar portion **56**, and a third planar portion **58**. A first hinge **60** communicates between the first and second portions **54**, **56** while a second hinge **62** communicates between the second and third portions **56**, **58**, respectively.

It is noted that the current mode shown shares many of the same features of the mode of the device **10** of FIGS. **1-5**, and is capable of forming the wedge shapes as shown in FIG. **4** and FIG. **5**, however with some differences. In the current mode the cash compartment (not shown) will extend the entire length of the main body **55** as is conventional with three-fold type configurations. A plurality of card holder compartments **72** are also provided. The third planar portion **58** includes a compartment **68** employed for containing a car headrest engagement means **70** and support member **74** for purposes described in the previous modes.

In this mode, a foldable card holder flap **64** engaged to the second planar portion **56** on one side edge **66** at or near the adjacent hinge **60** is provided. The flap **64** includes a plurality of card holder compartments **72** as shown for holding cards as previously described. In addition, the flap **64** can be rotated open from right to left, serving as a means for securing and stealthily hiding the support wings **76** located beneath, as shown in FIG. **7**.

A transparent ID compartment **80** may also be provided underneath the flap **64** as shown. It is noted that the flap **64** may alternatively be mounted on the opposite side or any other location deemed suitable by the designer and should not be considered limiting by the depiction. Snap fit type fasteners **65**, or other suitable fasteners are preferably employed for securing the flap **64** in the closed position as shown in FIG. **6**.

FIG. **8**, FIG. **9**, and FIG. **10** show views of yet another particularly preferred of the present invention. In this mode, the main body **82** of the device **10** is configured as a two-fold, or 'bi-fold' type wallet comprising a first planar portion **84** and a second planar portion **86** separated by a central hinge **88**. Means for carrying and storage of non-flat items is currently provided by a storage compartment **90** communicating with and extending from the central hinge **88**. The central hinge **88** and the ergonomic & asymmetric design of the device shown in FIGS. **8-12**, provide great utility in that an increase in both comfort and usability is afforded the device thereby enhancing utility.

The storage compartment is preferably permanently engaged, however removable engagement means as outlined in previous modes may be employed, and are anticipated. Permanent engagement means may include stitching, sewing, or other suitable means. The storage compartment **90** may have one or any suitable combination of an exterior **92** as well as interior **94** compartment access means which allows the user to easily retrieve items from the storage compartment **90** as needed. Compartment access means **92**, **94** may include openable zip fasteners, hook and loop fasteners, snap fits fasteners, or other suitable means.

Means for carrying and storage of conventional flat items is provided by one or a plurality of card holder compartments **96**, again in the form of slots. Further, an ID compartment **98** having a transparent viewing window is also included for purposes described previously. In addition, an interior sidewall **104** of the first planar portion **84** may be extendable in an accordion type fashion to reveal an interior hidden pocket **106** (shown more clearly in FIG. **10**). Addi-

13

tionally, a flap (not shown) may be included to cover the pocket **106** and it may also have a fastener to hold items securely in place. Such fasteners could include for example snaps, hook & loop fabric, magnets, or other suitable fasteners to secure the flap shut. Such of course will be in addition to being able to use it flap free if so desired by the designer.

Means for securely yet removably engaging a digital media device **1000** is provided by a flap **100** disposed on the exterior surface of the second planar portion **86** (or first planar portion **84** if deemed suitable by the designer). However, the flap **100** is preferably secured to the exterior of the second planar portion **86** at one edge **102** such that the flap **100** can be rotated to create a platform for digital media device support as shown in FIG. **10**. It is noted however that the flap **100** may be engaged at more than one edge **102** as needed for added support, and may possibly include an elastic support member for addition support of the flap **100** when folded out for use as a platform. Further, the provision of snaps, hook and loop fabric, or other suitable fasteners may be employed to secured the flap **100** closed when not in use.

It is also anticipated that the flap **100** may be formed to lie flush with the exterior of the second portion **86**, however still engaged at only one edge **102**, or possibly multiple edges or incorporating a support member if needed for added support. The user simply inverts the device **10** as shown to provide an inverted V support stand for engaging the digital media device **10**. By varying the angle at the hinge **88** formed between the first and second planar portions **84**, **86**, the user is provided with means for adjusting the viewing angle as desired by the user.

FIG. **11** shows another particularly preferred mode of the invention wherein the storage compartment **90** includes an access aperture **91** configured to receive a rigid container **108**. The container **108** may be in a removable or permanent engagement within the compartment, as deemed suitably by the designer. The rigid container **108** preferably has a removable cap **110**, which may employ frictional engagement means, threaded engagement, or other engagement means suitable for the intended purpose. The rigid container **108** will allow the user to store fragile items, such as an insulin needle, test strips which are commonly used by diabetics, however the container **108** can be employed for an items deemed suitable by the user. Further it should be noted that the shape of the storage compartment **90** itself, its access, or both may be changed to accommodate other contents, and the compartment **90** and/or access thereto may be formed of stretch or elastic material to conform to other contents, or of elastic frictionally engaging material such as neoprene or rubber or surfaced material offering easy ingress for cards but frictional resistance to removal. Further, stacking items such as credit cards, directly on top of each other but adjacent such elastic or stretch material offers a space saving benefit because no material is placed between the cards, thus keeping the size of the wallet smaller.

It should be noted that container **108** need not be in the shape of a cylinder, but that it can also be made in many other shapes as would occur to a designer or one skilled in the art and such are anticipated. Also that it may alternatively be constructed in a manor that allows that inner container to also be flexible, while still offering additional crush resistance. This is accomplished by using a coil type construction for the container **108** which would allow it to be flexible, while still offering additional strength to keep the container from getting crushed. Material could be wrapped around the coil or a type of hose already offering sidewall

14

structural strength could be used. The inner sleeve **111** in this scenario, would still protected items stored inside the compartment and still afford protection from being crushed.

As an alternate way of constructing the storage compartment **90**, it can be formed with both fixed and detachable compartments may alternately be made by allowing the two planer modes to be separated with the storage compartments material in between them. This mode may have a zipper or other suitable closure running between the planer storage compartments or access into the storage compartment could be made from inside the wallet.

FIG. **12** shows another mode of the rigid container **108** having a cutout portion **112** configured to align with the zipper access **92**. As such the user is permitted to access the rigid container **108** from the zipper access **92** without removing the entire container **108**.

FIG. **13** shows still yet another preferred mode of the rigid container **108** wherein the cap **110** includes an integrated sleeve container portion **111**, also for holding fragile items. In this manner the user does not have to remove the entire container **108** to retrieve their items, but may simply remove the cap **110** with sleeve portion **111** engaged thereto.

FIG. **14** depicts another preferred mode of the device **10** showing optional exterior card holder compartments **114** arranged in a staggered formation. The staggered arrangement will allow the user to more easily grasp individual cards engaged with the compartments **114**. In addition, a transparent ID card holder **116** may also be included for holding ID cards or other items deemed suitable by the user.

In FIG. **15** for example of the utility of the device herein, there is depicted the wasted space of conventional wallets lacking the conformability of the device herein. However as shown in FIG. **16**, a wallet according to the device herein is able to follow the natural curve of the leg of a user, with no wasted space below or above ends of wallet and maintaining the ability to store an equal amount or more cards. Also, a much more comfortable fit to the user's body is afforded, especially when sitting long periods.

FIG. **17** depicts a mode where one compartment is slightly shortened and FIG. **18** depicts a device per the disclosure herein with one planer compartment shortened by approximately $\frac{1}{2}$ inch. This aligns both ends line vertically when in the bent ergonomic bent position such as in FIG. **16**. This allows the overall length of the wallet to be shortened mid-point to mid-point, while also looking and feeling comfortable and more natural in the pocket.

In FIG. **19** is depicted a series of views of another preferred mode of the wallet device having a multiple compartment wallet body **120** and engageable support member for a smartphone or the like for angled positioning. As depicted in FIGS. **19a-19c**, the body **120** includes on a first side, first compartment **122** adapted for insertion of cash and flexible planar items, and on a second side, a second compartment **124** adapted for credit cards.

Preferably positioned within the first compartment **122** is a planar divider **126** formed of stiff but flexible material such as plastic which will bend with the wallet body **120** but is sufficiently rigid to divide the first compartment **122** so that as in FIG. **19G** cash may be separated from paper such as receipts.

Shown in FIG. **19c** the wallet body **120** has cash in the first compartment **122** and credit cards frictionally engaged in the second compartment **124**. This positioning of cash and credit cards is make easier by the formation of sidewalls **128** of both the first compartment **122** and second compartment **124** from stiff but flexible material such as leather bonded to plastic sheeting or treated leather or synthetic material

15

rendering the sidewalls flexible to bend, but sufficiently elastic in nature that the sidewalls **126** return to their planar shape of FIGS. **19a-19c**. This flexure allows for easy insertion and removal of cash and credit cards, and, applies a bias to contents of both pockets to increase a frictional engagement therein.

As shown in FIG. **19**, a recess or notch **130** is cut into the sidewalls **128** of both compartments. This as shown in FIG. **19J** allows for a compressed engagement between the finger and thumb of the user to insert and remove cash and credit cards from the compartments **122** and **124**.

Shown in FIG. **19k**, the wallet body **120** is flipped vertically with the second compartment **124** Card Compartment on Right. A strap of hook and loop fastener **134** is partially removed from connecting position **136** for hook and loop fastener on a visual media stand **138** engaged with the wallet body **120** which is shown in FIG. **19L** with the hook and loop fastener **134** fully engaged.

As depicted in FIG. **19M**, the device as in FIG. **19L** is placed face down, showing the stand **138** positioned on a rear surface of the wallet body **120**. Removal and deployment of the stand **138** is shown starting in FIGS. **19M** and **19N** wherein the hook and loop fabric **134** is disconnected which holds the stand **138** to the body **120**.

Deployment of the stand **138** when removal from the wallet body **120** continues in FIGS. **20A** and **20B** wherein the stand **138** is fully disconnected from the hook and loop fabric **134** half, and is translated away from the wallet body **120** to disengage a projecting portion **140** from a positioning within a formed pocket in the wallet body **120** such as the second compartment **124** or another formed pocket in the sidewall **128** of the wallet body **120** adapted in size to engage the projecting portion **140**.

Shown disconnected in FIG. **20C** through **20E**, the stand **138** is shown with opposing folding wings **142** or wing portions, and showing a headrest retainer **144** being held planar by a fastener such as hook and loop fabric. In FIG. **20F** the stand **138** is shown detached from main wallet body **120** along with bands **148** encircling the smartphone **146** which are engaged to the a mid-portion of the body forming the stand **138**. These bands are preferably elastic such that they will compressibly engage the smartphone **146** but could be hook and loop fabric bands, or bands secured by fasteners also.

Shown in FIGS. **20G** to **20i**, mating fasteners **150** on both the projecting portion **140** and the headrest retainer **144** are positioned to removably engage to form a base as in **20j** which is shown flipped to an as-used positioning in FIGS. **20J** through **20O**, whereby a triangular support or easel is formed to support the smartphone **146** which is held to the stand by the bands **148** in an inclined angle or vertically disposed to the underlying support surface for the formed support. By adjusting the lateral positioning of the hook and loop fasteners **136** shown in FIGS. **20G** and **20H** relative to each other, a means to adjust the angle the smartphone **146** is held by the formed stand is available. shows a second series of views of the device of FIG. **19**

In FIG. **21** there is shown a series of other views of the device of FIGS. **20** and **19**, in FIGS. **21A** through **21L** where it is configured between a closed position for pocket engagement and an open position, where the stand **138** remains engaged with the wallet body **120** during such reconfiguration and engagement to the smartphone **146** using bands **148**.

In FIGS. **21M** through **21O**, deployment of the headrest retainer **144** portion is shown in a manner adapted to engage through the space between a vehicle seat and the headrest

16

positioned atop the seat where a gap is therebetween. As can be seen, the headrest retainer **144** can be positioned horizontal and adjacent the body of the stand **138** wherein it will slide through the gap between most vehicle seats and an engaged headrests. Once through this gap, the headrests retainer **144** is rotatable to a position substantially normal or perpendicular to the body of the stand **138** at one end thereof, where the width of the headrest retainer **144** is wider than the gap between headrest and seat. The stand **138** will hang downward from its engagement to the headrest retainer **144** due to the weight of the smartphone **146** or similar computing device with a video display, which is engaged to the stand **138** by bands **148**. Finally, as shown in **21J-21L**, another means for angle adjustment of the screen of a smartphone **146** or similar device with a video screen, to the user, is provided by the translating into and out of a pocket in the wallet body **120** of the projecting portion **140** of the stand **138**.

Finally, in FIG. **22** various perspective views are shown of the stand **138** operatively engaged with the wallet body **120** through positioning of the projecting portion **140** into pocket formed in the sidewalls as noted above, or into the first cavity **122** or second cavity **124**.

This invention has other applications, potentially, and one skilled in the art could discover these. The explication of the features of this invention does not limit the claims of this application; other applications developed by those skilled in the art will be included in this invention.

Thus, upon reading this disclosure, those skilled in the art may recognize various other means for carrying and storage of non-flat items and conventional flat items, means for securely yet removably engaging digital media devices, means for holding the digital media device at a plurality of viewing angles, and means for adjusting the viewing angle, which are considerably or slightly different those disclosed, are considered within the scope and intent of the invention herein, and are anticipated withing the scope of this patent.

It is additionally noted and anticipated that although the device is shown in its most simple form, various components and aspects of the device may be differently shaped or slightly modified when forming the invention herein. As such those skilled in the art will appreciate the descriptions and depictions set forth in this disclosure are merely meant to portray examples of preferred modes within the overall scope and intent of the invention, and are not to be considered limiting in any manner.

While all of the fundamental characteristics and features of the invention have been shown and described herein, with reference to particular embodiments thereof, a latitude of modification, various changes and substitutions are intended in the foregoing disclosure and it will be apparent that in some instances, some features of the invention may be employed without a corresponding use of other features without departing from the scope of the invention as set forth. It should also be understood that various substitutions, modifications, and variations may be made by those skilled in the art without departing from the spirit or scope of the invention. Consequently, all such modifications and variations and substitutions are included within the scope of the invention as defined by the following claims.

What is claimed is:

1. A wallet, comprising:

a first body portion having a first end and a second end and having a plurality of compartments on a first side surface adapted to hold cards therein;

17

a second body portion having a first edge and a second edge and having opposing side edges running therebetween;

said second body portion having a first side surface in-between said first edge and second edge; 5

said first edge of said second body portion in a hinged engagement with said second end of said first body portion;

a folding body portion having a first end opposite a second; 10

said second end of said folding portion in a hinged engagement to said second edge of said second body portion;

said folding body having a first side surface opposite a second side surface; 15

said folding body portion rotatable in said hinged engagement between an unfolded position and a stowed position having said first side surface of said folding body portion held in a contact against said first side surface of said second body portion by a retainer; 20

a first support wing extending from an engagement with a first of said opposing side edges of said second body portion;

said first support wing moveable from a stowed position held in a sandwiched engagement between said first side surface of said folding body portion and said first side surface of said second body portion with said folding body portion in said stowed position, to an unfolded position extending away from said first of said opposing side edges; 25

a second support wing extending from an engagement with a second of said opposing side edges of said second body portion;

said second support wing moveable from a stowed position held in a sandwiched engagement between said first side surface of said folding body portion and said first side surface of said second body portion with said folding body portion in said stowed position, to an unfolded position extending away from said second of said opposing side edges; 30

said second support wing moveable from a stowed position held in a sandwiched engagement between said first side surface of said folding body portion and said first side surface of said second body portion with said folding body portion in said stowed position, to an unfolded position extending away from said second of said opposing side edges; 35

18

said wallet configurable to a stand having a triangular shape with said first end of said folding portion in contact with said first end of said first body portion, and with a second side surface of said of said first body portion adapted for contact with a support surface for said stand; and

a second side surface of said second body portion, opposite said first side portion thereof, combined with adjoining respective surface areas of said first support wing and said second support wing, defining a digital media support surface adapted for positioning a digital media device thereon at an inclining angle relative to said support surface.

2. The wallet of claim 1, additionally comprising: said engagement of said first support wing with said first of said opposing side edges being a first removable engagement; and said engagement of said second support wing with said second of said opposing side edges being a second removable engagement.

3. The wallet of claim 1, additionally comprising: a first of a pair of elastic support straps engaged to said first support wing; a second of a pair of elastic support straps engaged to said second support wing; and said pair of elastic support straps adapted to hold a said digital media device in a compressive contact against said digital media support surface.

4. The wallet of claim 3 additionally comprising: a strap extending from said first end of said folding body portion; a clip engaged to a distal end of said strap, said clip adapted to removably engage with a mount and suspend said wallet therefrom.

5. The wallet of claim 1 additionally comprising: a strap extending from said first end of said folding body portion; a clip engaged to a distal end of said strap, said clip adapted to removably engage with a mount and suspend said wallet therefrom.

* * * * *
