UNITED STATES PATENT OFFICE.

GEORGE C. BRITNER, OF BROOKLYN, NEW YORK.

DESIGN FOR BUTTONS.

Specification forming part of Design No. **10,391**, dated January 8, 1878; application filed November 26, 1877.
[Term of Patent 3½ years.]

To all whom it may concern:

Be it known that I, GEORGE C. BRITNER, of Brooklyn, in the county of Kings and State of New York, have invented a new and original Design for a Button, of which the following is a specification:

The nature of my design is fully represented in the accompanying drawing, to which reference is made, and in which—

Figure 1 is a top view; and Fig. 2, a vertical central section of my improved button on line *x x*, Fig. 1.

Similar letters of reference indicate corresponding parts.

This invention relates to a design for a button for ladies' dresses, cloaks, &c.; and it consists of a button having an annular raised or bulging part, with central depression or concavity, and an outer encircling concaved or dishing portion and rim.

Referring to the drawing, A represents my improved button, which is made of any size or material, and formed with a central raised or bulging portion, *a*, of annular shape, that is

provided with a central depression or concavity, *b*. The bulging portion *a* is encircled by an annular concaved part, *d*, that is continued gradually to the outer inclosing-rim *e*, as clearly shown in the drawing.

The central portion, being raised considerably above the level of the encircling part, imparts a characteristic and striking feature to the button, and forms the essential element of the design, to which, however, a certain degree of lightness and neatness is imparted by the central depression and encircling concaved rim portion.

I claim as my invention—

The design for a button consisting of an annular raised portion with central depression or concavity, and of an encircling concaved and rimmed portion, substantially as shown and described.

GEORGE C. BRITNER.
