(57) **CLAIM**

The ornamental design for a computer monitor displaying a graphical user interface, as shown and described.

DESCRIPTION

The file of this patent contains at least one drawing/photograph executed in color. Copies of this patent with color drawing(s)/photograph(s) will be provided by the Office upon request and payment of the necessary fee.

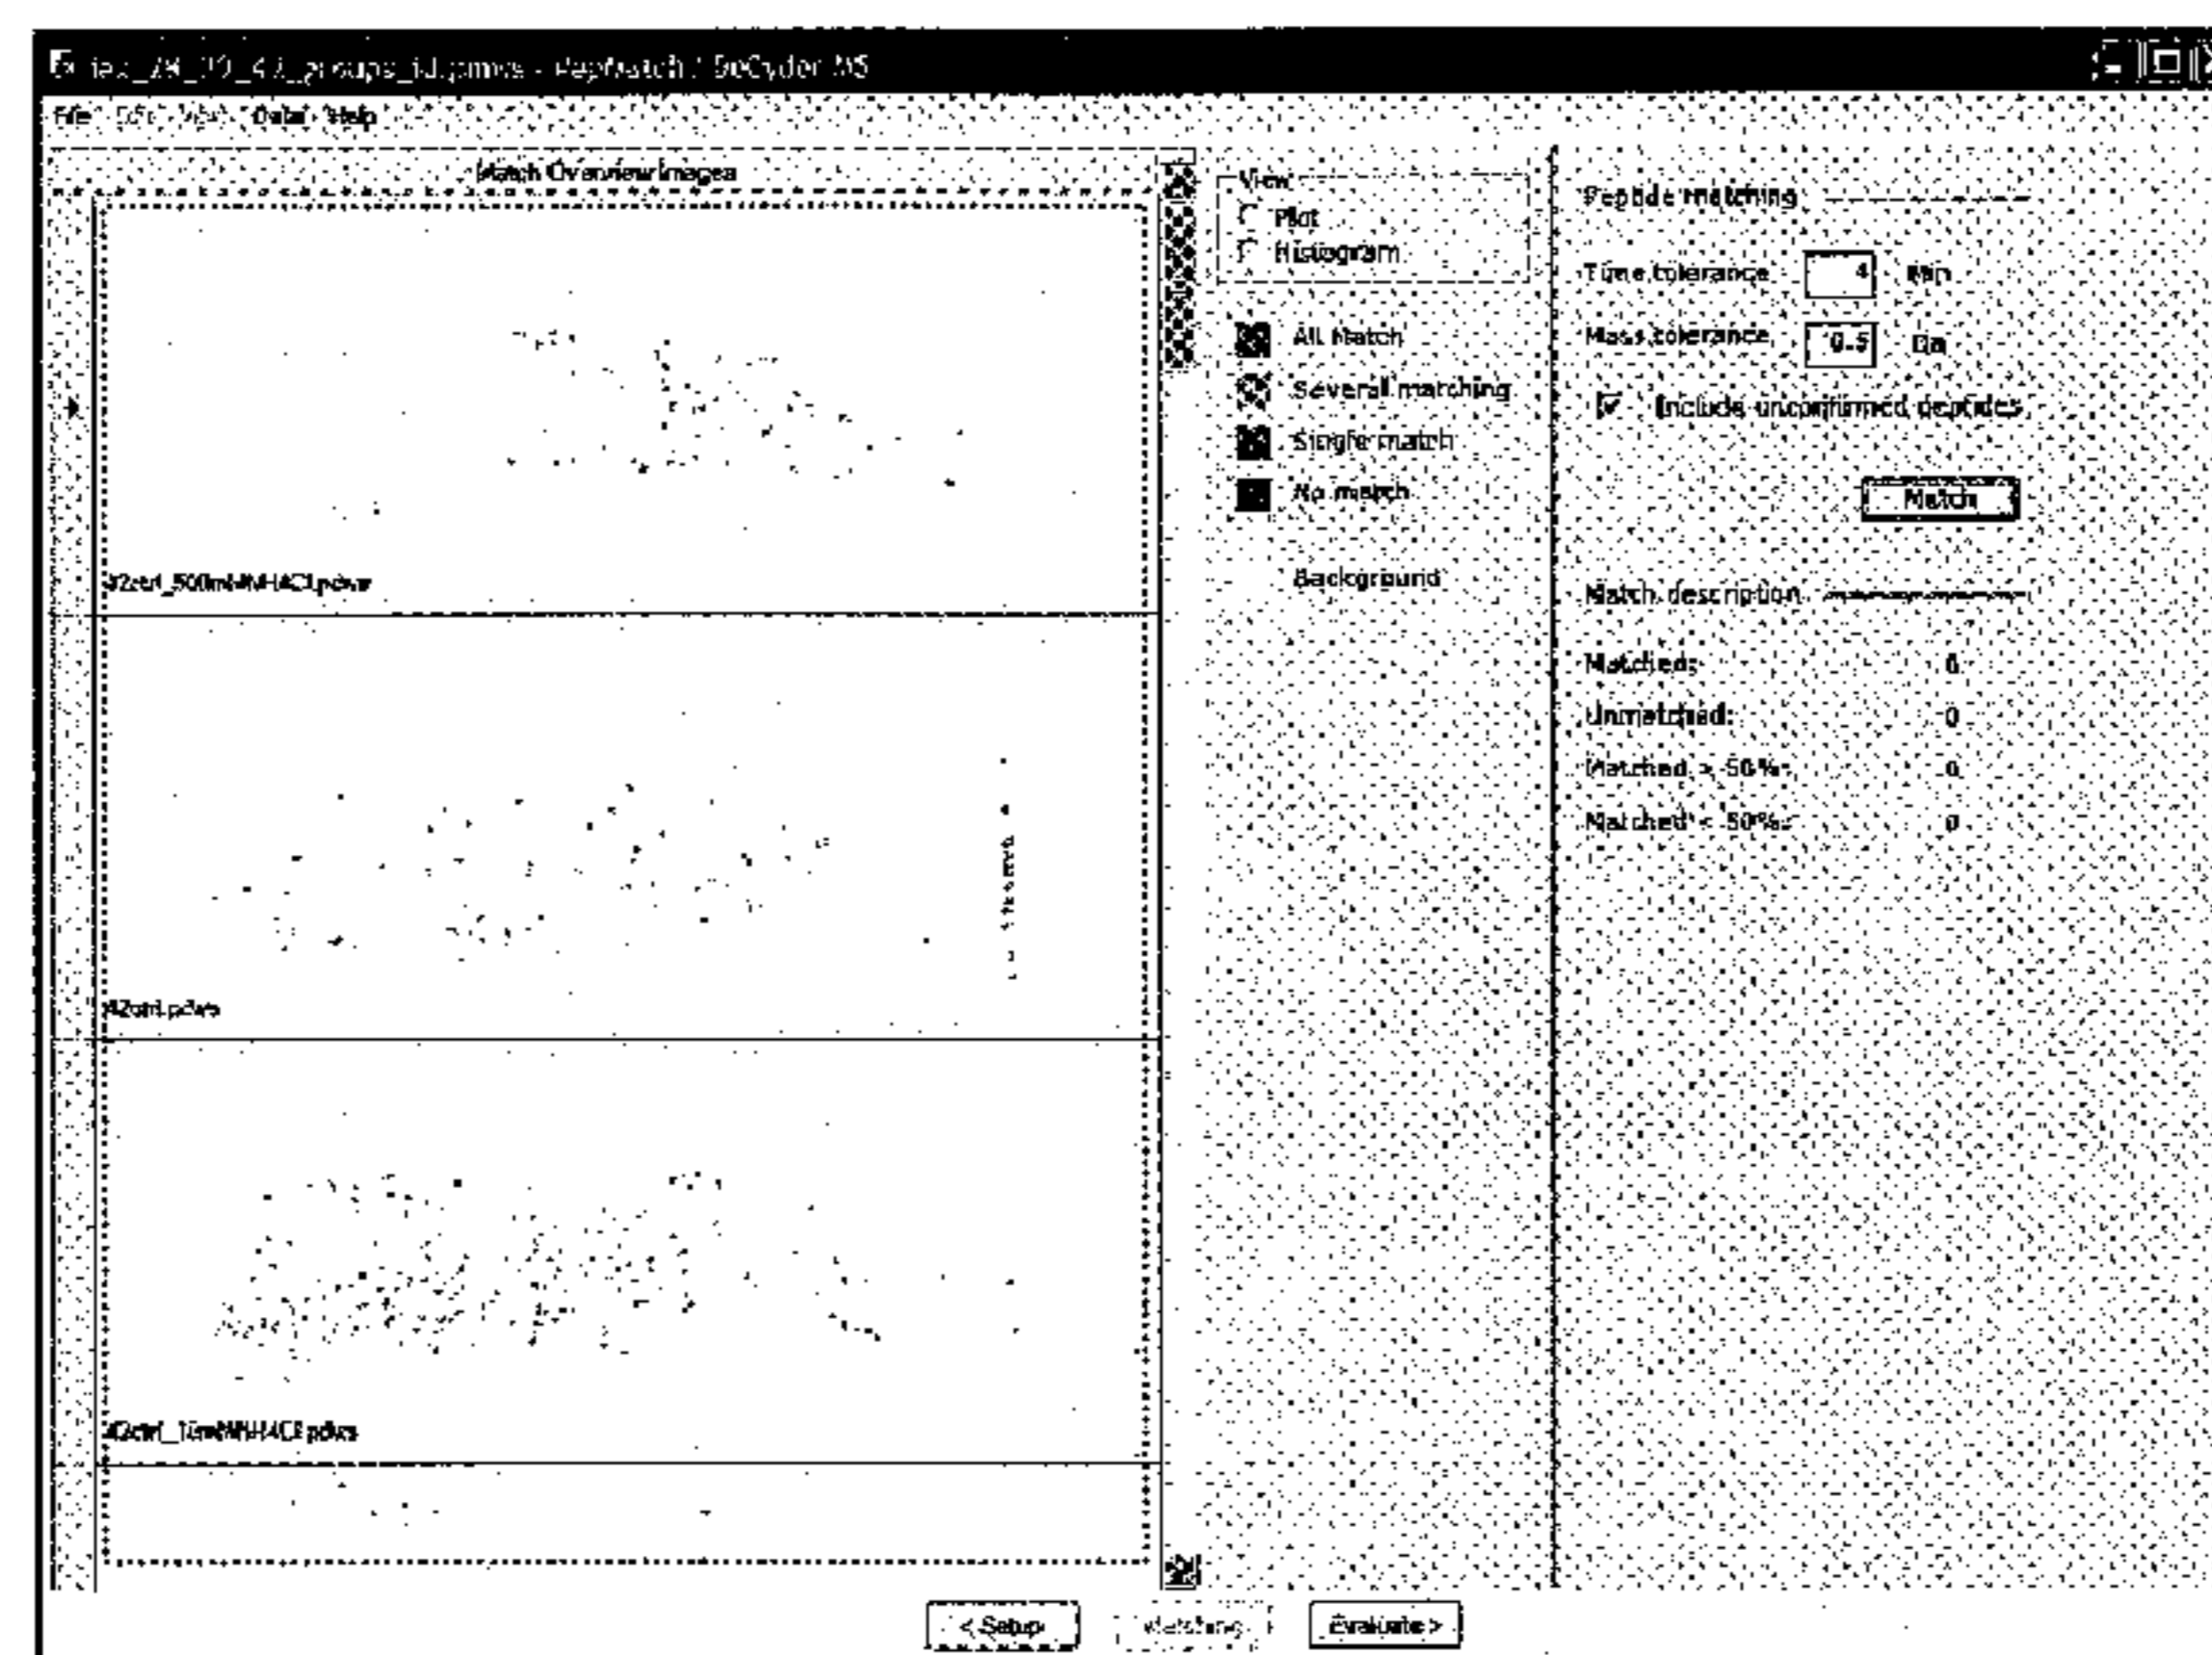

The FIGURE is a front view of a computer monitor displaying a graphical user interface showing our new design.

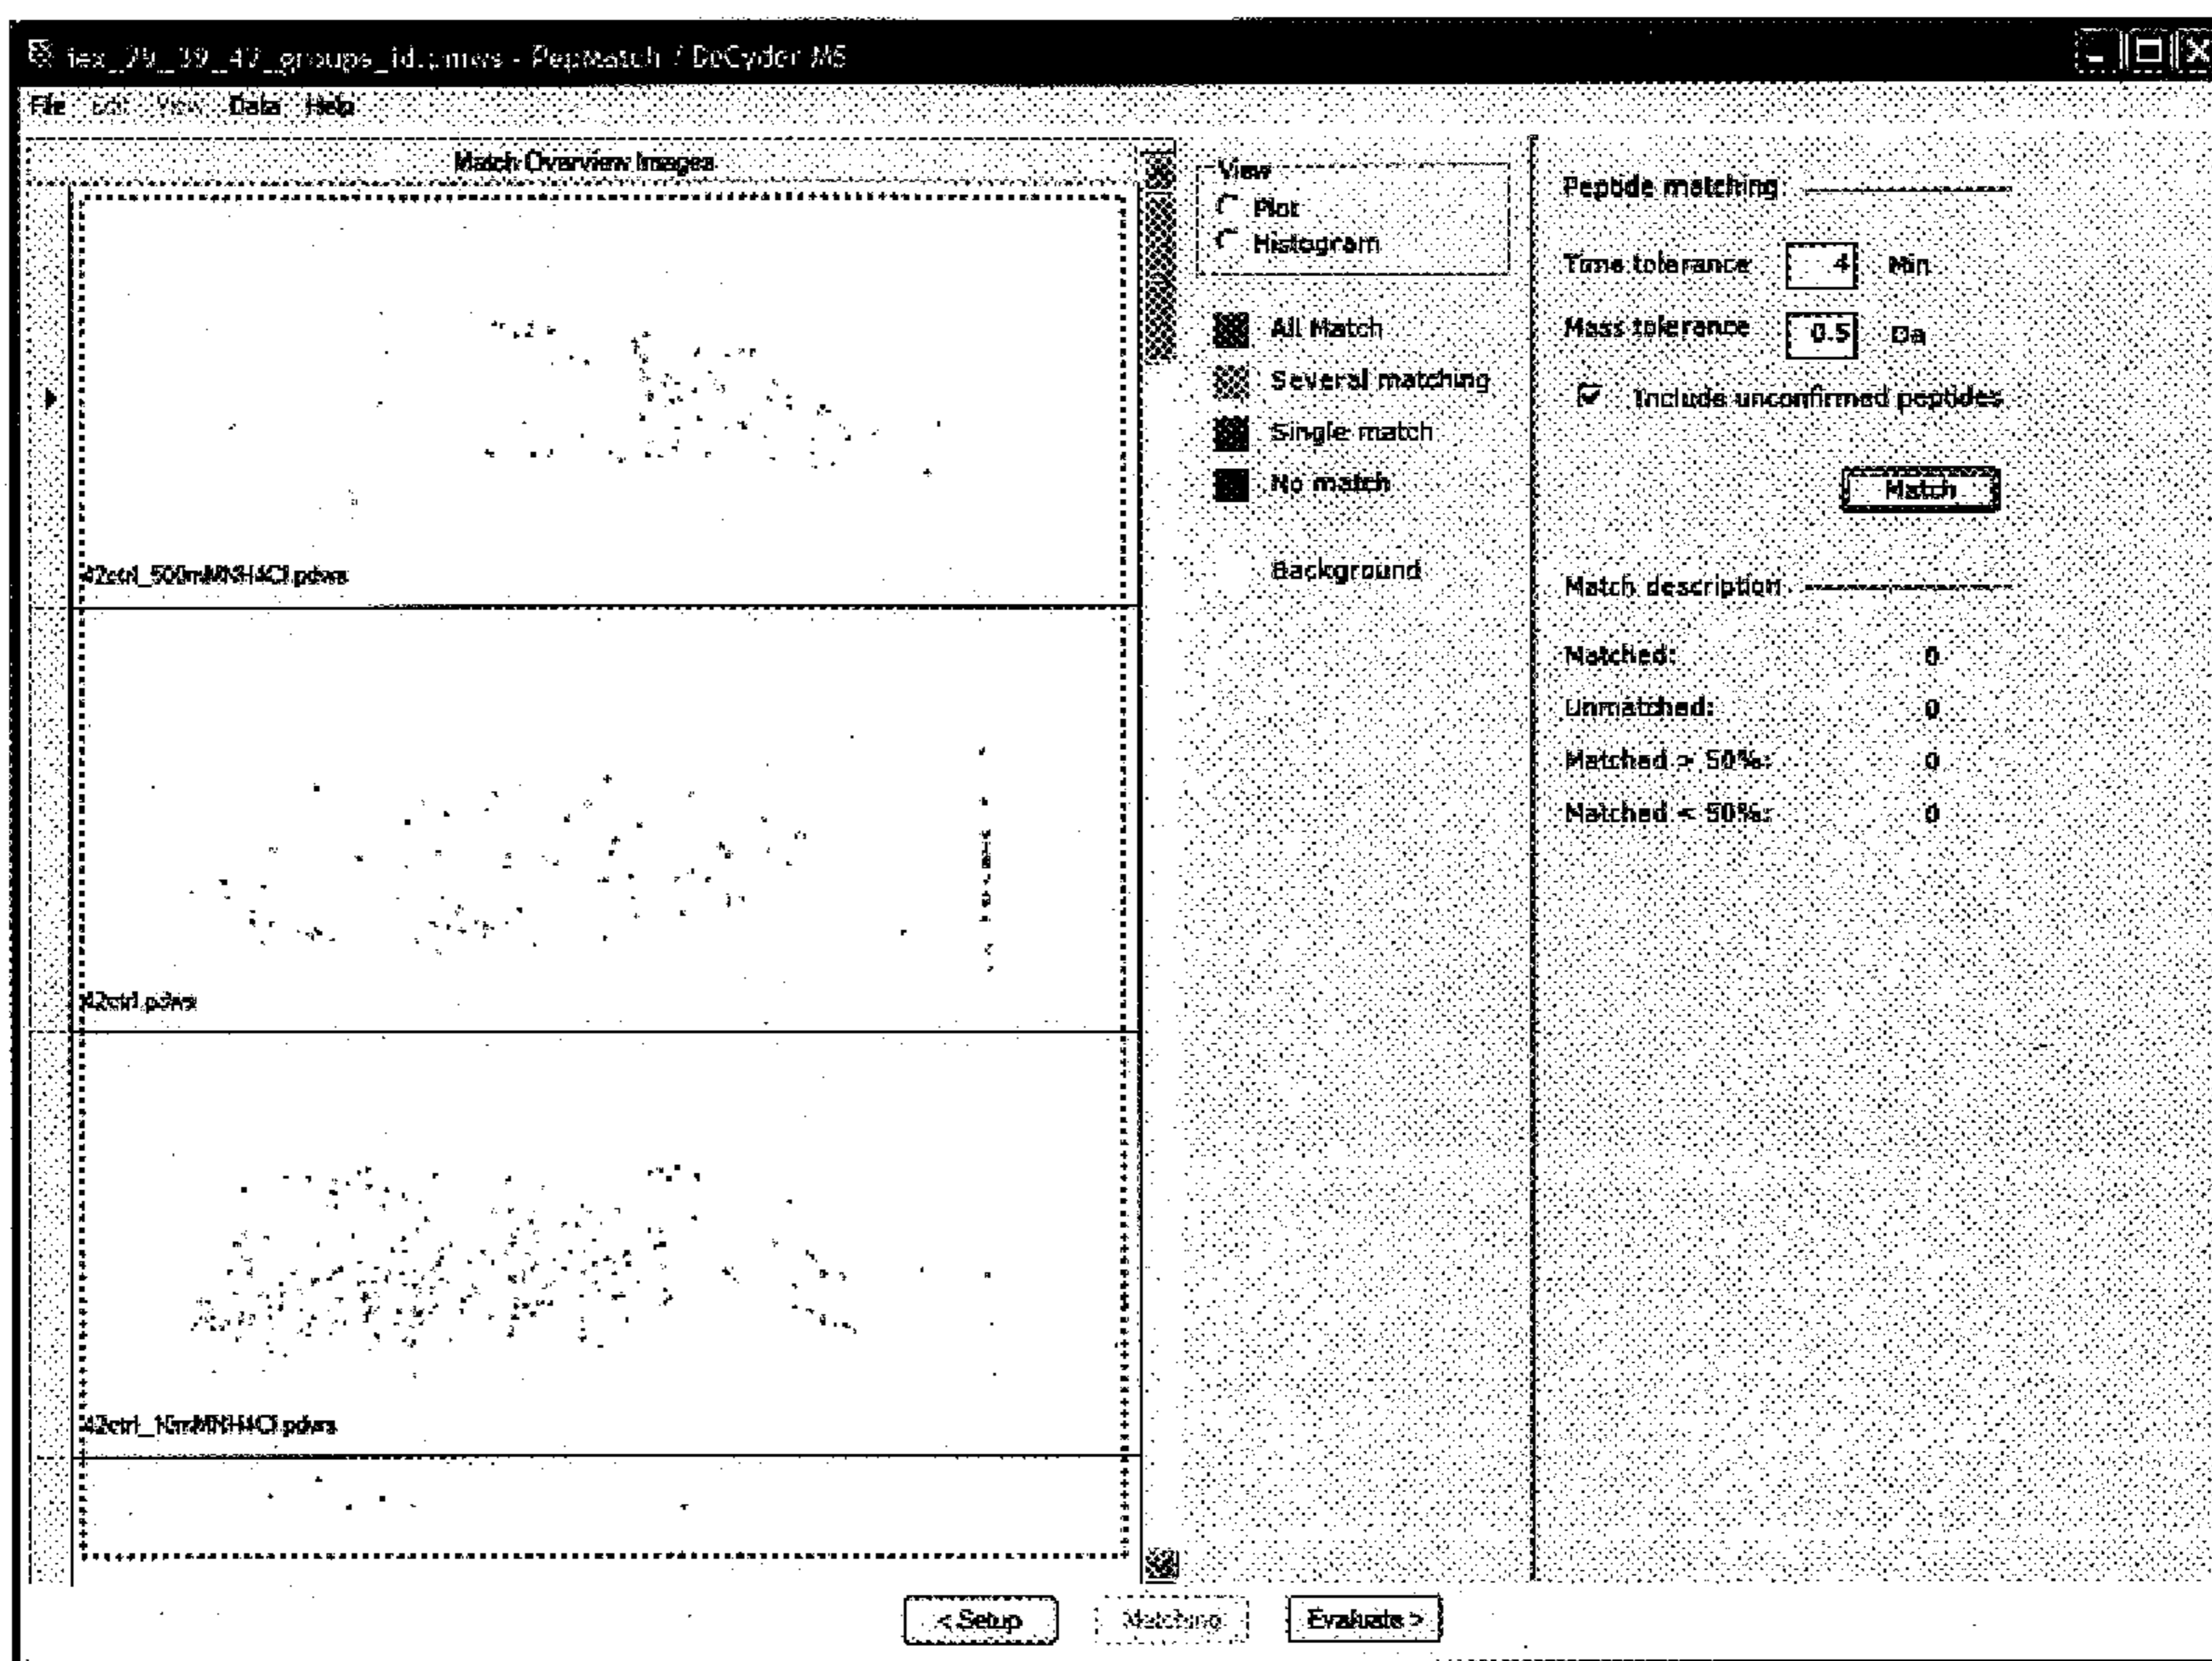

This design is a view of a screen shown on a computer monitor. The view is from a program which compares two or more images of spots of separated molecules (e.g. peptide molecules) from different samples in order to find matches between the images. The program assigns different colors to the spots depending on whether or not they match with a spot in one or more of the other images. This makes it easier for an operator to see which molecules are present in all the samples and which are present in only one or a few of the samples.

The perimeter of the portion of the computer monitor and the graphical user interface are understood to be flush.

The broken line showing of the graphical user interface is included for the purpose of illustrating portions of the article and forms no part of the claimed design.
