**DIANTHUS PLANT**

Jacob R. Mittleider, Loma Linda, Calif., assignor to Milo Academy, Inc., Milo, Oreg., a corporation of Oregon  
Filed Sept. 23, 1963, Ser. No. 310,960  
1 Claim. (Cl. Plt.—72)

The present invention relates to a new and distinct variety of dianthus plant, which is characterized particularly by a low growing, compact, densely tufted plant bearing numerous large double flowers of a coral rose color, and having a faint carnation-like fragrance.

The new and different plant variety is the result of an extensive breeding program at my nursery in Loma Linda, California, seeking new varieties of dianthus that would be especially suitable for mass plantings or edgings, without the necessity of staking the blooms. The characteristics sought were: (1) carnation foliage, (2) ever-blooming habit, (3) compactness, (4) fragrance, (5) large blooms, (6) strong stems, (7) hardiness and disease resistance, (8) pleasing new colors.

The present variety is the result of a four step breeding operation, as follows: (1) Dianthus Rose Bowl (Plant Patent No. 2,034) was crossed with Dianthus Old Spice (Plant Patent No. 499) using pollen from Old Spice to pollinate Rose Bowl. (2) Pollen from seedlings resulting from the first cross was then used to pollinate a Malmaison carnation seedling. The Malmaison strain of carnation is characterized by very large flowers which, in this case, were very double bi-color blossoms of mixed red and white coloring. (3) Pollen from seedlings resulting from the second cross was then used to pollinate Dianthus Ruby Gem (unpatented). (4) Seedlings from the third cross were "selfed," which is a term for artificially pollinating the plants of a group having the same genes. Out of some 15,000 seedlings resulting from this fourth step, one plant was discovered which combined the desired low growing, compact, bushy plant form with masses of large double flowers of a coral rose color, borne on the ends of stiff, upright stems about 6 to 7 inches long, and having a faint carnation-like fragrance.

The original reproduction of the plant by cuttings was carried out in the experimental section of my nursery at Loma Linda, California. Asexual reproduction of my new variety by cuttings, as performed by me at the nursery, shows that the characteristics and distinctions of the variety come true to form and are established and transmitted through succeeding propagations.

The plant grows best in well-drained, loamy soil, but is not critical as to the pH of the soil. Best blooms are obtained when the plant is grown in full sunlight.

The accompanying drawing shows a typical plant of my new variety, showing the flowers and foliage depicted in color as nearly true as it is reasonably possible to make the same in a color illustration of this character.

The following is a detailed description of my new variety, as based on my observations of specimens grown at Loma Linda, California, with color terminology and identifications in accordance with "A Dictionary of Color" by Maerz and Paul.

2

Plant:

*Form.*—Compact, growing to a height of two to three inches.

*Growing habit.*—Densely tufted.

*Blooming habit.*—Floriferous, flowering evenly over the entire plant, with blossoms ranging from 3 or 4 on one year old plants grown in three inch pots, up to 20 or more on two year old plants.

*Blooming season.*—Perpetual in southern California, or wherever the mean temperature is above 50° F. Where the mean temperature drops below 50° F., the plant becomes dormant and ceases to bloom. Maximum bloom in southern California occurs from March through July, and in October and November; while minimum bloom occurs from August to October and from December through February.

*Foliage size.*—Maximum size of mature leaves on thrifty young plants is approximately 2 to 3 inches in length, by three-sixteenths of an inch in width.

*Quantity.*—Abundant.

*Shape.*—Lanceolate, or grass-like.

*Color.*—Growing under good conditions, the color of mature leaves is a deep true green, corresponding almost exactly to Aspen Green (Plate 31-C-6 in Maerz and Paul's Color Dictionary).

*Texture.*—Glaucous.

Flower:

*Size.*—The maximum size is about 1¾ to 2 inches in diameter, by ¾ inch high.

*Borne.*—At the end of the stem.

*Stem.*—Stiff and upright, approximately 6 to 7 inches in length.

*Petalage.*—Double.

*Color.*—The flower is a uniform coral rose color (Plate 2-K-8, Maerz and Paul, Begonia Gaiety).

*Petals.*—Firm in texture, of obovate form with regular crenate margins. The size of the individual petals is about 1 inch in length by ¾ inch in width.

*Fragrance.*—Faint, carnation-like.

*Calyx.*—Spreading at the tip, with acuminate teeth, and approximately 1 inch in length.

Compared to other well-known dianthus plants, this new variety is distinguished by its low-growing, compact form and distinctive, large, double flowers of coral rose color, with a faint carnation-like fragrance.

I claim:

A new and distinct variety of dianthus plant, substantially as shown and described herein, characterized particularly by its floriferous blooming habit, low-growing, compact, densely tufted plant form, usually not exceeding two to three inches in height, and bearing many double flowers of a distinctive coral rose color, said flowers having a faint carnation-like fragrance, and being borne at the ends of stiff upright stems approximately 6 to 7 inches in height.
