[57] ABSTRACT

A perennial St. Augustine grass having outstanding cold tolerance, along with good resistance to St. Augustine Decline Virus and gray leaf spot.

1 Drawing Sheet

1

BACKGROUND

A St. Augustine grass which has been named "Seville" was disclosed in U.S. Plant Pat. No. 4,097, which issued on Sept. 6, 1977.

SUMMARY OF THE VARIETY

This invention relates to a new and distinct perennial St. Augustine grass selected from the progeny of the controlled pollination of Seville with the pollen from a cold tolerant selection obtained from Memphis, Tenn. This yellow anther, white stigma genotype was labeled 6-72-99 and propagated vegetatively by stolons to provide planting stock for studying performance and making comparisons to present commercial varieties.

The excellent cold tolerance, good overall appearance, and good resistance to St. Augustine Decline Virus and gray leaf spot of 6-72-99 along with other information, allow this genotype to be distinguished from other St. Augustine grasses.

BRIEF DESCRIPTION OF THE ILLUSTRATIONS

FIG. 1 is a photograph of 6-72-99 St. Augustine turf; FIG. 2 shows a single spike of 6-72-99 St. Augustine grass plant depicting yellow anthers and white stigmas protruding from several spikelets.

DETAILED DESCRIPTION OF THE VARIETY

Genotype 6-72-99 has a yellow anther color, a white stigma color, and an unreduced chromosome number of 18. The internodes are shorter and thicker than most commonly grown St. Augustine grass cultivars. Leaf blade length and leaf sheath length are significantly shorter than Floratam, a widely grown cultivar in Florida and Texas. The difference between 6-72-99 and Floratam in leaf blade length is accentuated under low light growing conditions. Floratam is noted for its poor shade performance in contrast to most St. Augustine grasses. The blade width of 6-72-99 is equal to or wider than other St. Augustine grasses. Measurements of the spike and related structures indicate that 6-72-99 has a longer spike, a longer peduncle, and a longer flag leaf sheath than other St. Augustine grasses except for Floratam. The chromosome numbers, anther and stigma color and morphological measurements of 6-72-99 and other St. Augustine grasses are compared in Tables 1, 2, 3 and 4.

2

TABLE 1

Chromosome numbers, anther color and stigma color of 6-72-99 and other St. Augustine grasses.			
Selection/Variety	Chromosome Number	Anther Color	Stigma Color
6-72-99	18	Yellow	White
Bitterblue	27	Yellow	Purple
Floratam	27	Yellow	Purple
Floratine	27	Yellow	Purple
Raleigh	18	Yellow	White
Seville	18	Yellow	Purple
Texas Common	18	Yellow	White
California Common	18	Yellow	White
1081	18	Purple	Purple

TABLE 2

Comparative measurements of internode length and thickness of 6-72-99 and other St. Augustine grasses.			
Selection/Variety	Internode Length (cm)		Internode Thickness (mm)
	Florida ^(a)	Ohio ^(b,c)	Ohio ^(b)
6-72-99	4.1	5.7	3.5
Bitterblue	3.7	6.9	2.7
Floratam	6.3	7.5	3.2
Floratine	4.7	5.8	2.7

LSD(.05)	12.4	1.08	6.7

^(a)Greenhouse planting - Marysville, Ohio.

Field observations of 6-72-99 indicate that it has generally good turf quality characteristics throughout the year. However, it excels during the cooler winter and early spring months in its turf quality and its ability to avoid injury to occasional cold and freezing temperatures. These characteristics of 6-72-99 as compared with other St. Augustine grasses is illustrated in Tables 5, 6 and 7.

Color of turf is an important component of turf quality. 6-72-99 has a pleasing green color throughout the year. In addition, minimizing loss of green color due to herbicide injury, cold, or other causes is also important in maintaining good quality turf for 6-72-99. Besides green color or loss of green color, St. Augustine grasses have a tendency to have a purple coloring in the stem. 6-72-99 has a low level of purpling in the stems. Minimizing the number of seedheads in turf is also important in maintaining high quality turf. 6-72-99 has a medium level of flowering shoots in turf. This information is illustrated in Tables 8, 9 and 10.

^(b)Test planted in the greenhouse.

Tolerance to various diseases and insects is important for maintaining good quality turf with minimum levels of pesticides. 6-72-99 has shown resistance to St. Augustine grass Decline Virus inoculations in the laboratory. In field studies, it has shown a good level of resistance to gray leaf spot (*Pyricularia grisea*) and dollarspot (*Curvularia* sp.). Tolerance to insects is an extremely difficult characteristic to measure accurately. For chinchbugs (*Blissus* sp.) and sod webworm (*Crambus* sp.), 6-72-99 has shown tolerance levels equal to most other St. Augustine grasses.
