(57) **ABSTRACT**

A new and distinct cultivar of Azalea plant named ‘Ospo’, characterized by its upright and outwardly spreading plant habit; glossy and very dark green-colored leaves; freely branching habit; red-colored double flowers; and excellent postproduction longevity.

1 Drawing Sheet

1

Botanical classification/cultivar designation: *Rhododendron simsii* ‘Ospo’.

BACKGROUND OF THE INVENTION

The present Invention relates to a new and distinct cultivar of Azalea, botanically known as *Rhododendron simsii*, and hereinafter referred to by the name ‘Ospo’.

The new Azalea is a naturally-occurring whole plant mutation of the *Rhododendron simsii* cultivar Otto, not patented. The new Azalea was discovered by the Inventors in February, 1998, in a controlled environment in Bad Homburg, Germany. The new Azalea was discovered and selected by the Inventors as a flowering plant within a population of plants of the parent cultivar.

Asexual reproduction of the new Azalea by terminal cuttings taken in a controlled environment in Sassenburg, Germany since April, 1999, has shown that the unique features of this new Azalea are stable and reproduced true to type in successive generations.

SUMMARY OF THE INVENTION

The new Azalea has not been observed under all possible environmental conditions. The phenotype may vary somewhat with variations in environment such as temperature, daylength and/or light intensity without, however, any variance in genotype.

The following traits have been repeatedly observed and are determined to be the unique characteristics of ‘Ospo’. These characteristics in combination distinguish ‘Ospo’ as a new and distinct cultivar:

1. Upright and outwardly spreading plant habit.
2. Glossy and very dark green-colored leaves.
3. Freely branching habit.
4. Red-colored double flowers.
5. Excellent postproduction longevity.

Plants of the new Azalea are most similar to plants of the parent, the cultivar Otto. Plants of the new Azalea differ primarily from plants of the cultivar Otto in flower color.

2

BRIEF DESCRIPTION OF THE PHOTOGRAPHS

The accompanying colored photographs illustrate the overall appearance of the new Azalea.

5 These photographs show the colors as true as it is reasonably possible to obtain in colored reproductions of this type. Colors in the photographs may differ slightly from the color values cited in the detailed botanical description, which accurately describe the colors of the new Azalea.

10 The photograph at the top of the sheet comprises a side perspective view of a typical flowering plant of ‘Ospo’.

The photograph at the bottom of the sheet is a close-up view of typical leaves and flowers of ‘Ospo’.

DETAILED BOTANICAL DESCRIPTION

15 The aforementioned photographs and following observations and measurements describe plants grown in Sassenburg, Germany in a glass-covered greenhouse under commercial production conditions. During the production of the plants, day temperatures were about 16° C. and night temperatures were about 10° C. Plants were pinched three times during the production of the plants. Plants used for the photographs and description were about 22 months from planting rooted young plants.

20 In the following description, color references are made to The Royal Horticultural Society Colour Chart, 1995 Edition, except where general terms of ordinary dictionary significance are used.

Botanical classification: *Rhododendron simsii* ‘Ospo’.

Parentage: Naturally-occurring whole plant mutation of *Rhododendron simsii* cultivar Otto, not patented.

35 Propagation:

Type.—By vegetative cuttings.

Time to initiate roots.—Summer: About 35 days at temperatures of 24° C. Winter: About 42 days at temperatures of 24° C.

40 *Time to develop roots*.—Summer: About 63 days at temperatures of 18 to 20° C. Winter: About 77 days at temperatures of 8° C.

Root description.—Fine; brown in color with white-colored root tips.

Rooting habit.—Freely branching; vigorous.

Plant description:

Plant form and growth habit.—Perennial, evergreen; upright and outwardly spreading plant habit; inverted triangle; uniform and symmetrical plant habit; moderately vigorous growth habit. Densely foliated. Freely flowering; numerous flowers per plant.

Branching habit.—Freely branching; about six lateral branches develop after pinching (removal of terminal apex).

Plant height, soil level to top of flowers.—About 17 cm.

Plant diameter, area of spread.—About 32 cm.

Lateral branch description.—Length: About 12 cm.

Diameter at base: About 2 mm. Texture: Sparsely pubescent. Color: Young: 145C. Mature: 164A.

Foliage description.—Arrangement: Alternate, single.

Length: About 3 to 6 cm. Width: About 1 to 2.2 cm.

Shape: Elliptic. Apex: Mucronate. Base: Attenuate.

Margin: Entire. Venation pattern: Pinnate. Texture,

upper and lower surfaces: Leathery; pubescent.

Color: Young foliage, upper surface: 146A; glossy.

Young foliage, lower surface: Close to 146C. Fully

expanded foliage, upper surface: Darker than 147A;

glossy. Fully expanded foliage, lower surface: Close

to 147B. Petiole: Length: About 7.5 mm. Diameter:

About 2 mm. Color, upper and lower surfaces: Close

to 146D.

Flower description:

Natural flowering season.—Spring after sufficient cool period. Flowers persistent.

Flower arrangement.—Double flowers arranged singly at terminals with usually about three to four flowers per apex; freely flowering. Flowers face upward and outward. Flowers not fragrant.

Flower diameter.—About 6 cm.

Flower depth.—About 3 cm.

Postproduction longevity.—Plants maintain good flower substance for more than four weeks.

Flower bud (before showing color).—Rate of opening: About three to four days depending on temperatures.

Length: About 1.5 cm. Diameter: About 8 mm. Shape: Ovoid. Color: 53D.

Petals.—Arrangement: Double flower form; one outer whorl of about five fused petals surrounding about five petaloid structures that are irregular in size. Length, petals: About 2.5 cm. Width, petals: About 2.6 cm. Shape, petals and petaloids: Broadly oblong. Apex, petals and petaloids: Broadly acute. Base, petals and petaloids: Fused. Margin, all petals: Entire. Texture, upper and lower surfaces: Smooth, velvety. Color: When opening and fully opened, upper surface: 47A; towards base, 47D to close to 155D. When opening and fully opened, lower surface: 47B.

Sepals.—Arrangement/appearance: Single whorl of five sepals fused towards base into a star-shaped calyx. Length: About 4 to 5 mm. Width: About 2 to 3 mm. Shape: Ovate. Apex: Acute. Margin: Entire. Texture, upper and lower surfaces: Smooth, glabrous. Color, upper and lower surfaces: 145C.

Peduncles.—Length: About 1 cm. Diameter: About 3 mm. Angle: Mostly upright. Strength: Flexible; strong. Texture: Pubescent. Color: 145C.

Reproductive organs.—Androecium: Stamens transformed into petaloid structures; occasionally one or two true stamens. Anther length: About 2 mm. Anther shape: Oblong. Anther color: Close to 79B. Amount of pollen: None observed. Gynoecium: Quantity of pistils: One per flower. Pistil length: About 2 cm. Style length: About 2.2 mm. Style color: 52C. Stigma shape: Rounded. Stigma color: Close to 165B. Ovary color: 145D; heavily whiskered.

Fruit/seed.—Fruit and seed production has not been observed.

Temperature tolerance: Plants of the new Azalea have been observed to tolerate temperatures from 2 to 38° C.

Disease/pest resistance: Plants have not been observed to be resistant to pathogens and pests common to Azaleas.

It is claimed:

1. A new and distinct Azalea plant named 'Ospos', as illustrated and described.
