A new and distinct cultivar of *Geranium* plant named 'Clips Whitspla', characterized by its upright, outwardly spreading and rounded growth habit; freely basal branching habit; dark green-colored leaves; freely flowering habit with many flower umbels per plant; and flower umbels with numerous white and red purple bi-colored single flowers.

**1 Drawing Sheet****1**

Botanical classification/cultivar designation: *Pelargonium×hortorum* cultivar Clips Whitspla.

**BACKGROUND OF THE INVENTION**

The present invention relates to a new and distinct cultivar of *Geranium* plant, botanically known as *Pelargonium×hortorum*, commercially known as a Zonal *Geranium*, and hereinafter referred to by the name 'Clips Whitspla'.

The new *Geranium* is a product of a planned breeding program conducted by the Inventor in Gilroy, Calif. The objective of the breeding program is to develop new Zonal *Geranium* cultivars with good basal branching, freely flowering habit and attractive flower and foliage coloration.

The new *Geranium* originated from a cross-pollination made by the Inventor in April, 2000 of a proprietary *Pelargonium×hortorum* selection identified as code number 8553-1, not patented, as the female, or seed, parent with the *Pelargonium×hortorum* cultivar BFP-1700, disclosed in U.S. Plant Pat. No. 11,397, as the male, or pollen, parent. The cultivar Clips Whitspla was discovered and selected by the Inventor as a flowering plant within the progeny from this cross-pollination in a controlled environment in Gilroy, Calif. in September, 2000.

Asexual reproduction of the new cultivar by terminal cuttings at Gilroy, Calif., since September, 2000 has shown that the unique features of this new *Geranium* are stable and reproduced true to type in successive generations of asexual reproduction.

**SUMMARY OF THE INVENTION**

The following traits have been repeatedly observed and are determined to be the unique characteristics of 'Clips Whitspla'. These characteristics in combination distinguish 'Clips Whitspla' as a new and distinct *Geranium* cultivar:

1. Upright, outwardly spreading and rounded growth habit.
2. Freely basal branching habit.
3. Dark green-colored leaves.
4. Freely flowering habit with many large flower umbels per plant.

**2**

5. Flower umbels with numerous white and red purple bi-colored single flowers.

In side-by-side comparisons conducted in Gilroy, Calif., plants of the new *Geranium* differed from plants of the female parent selection in the following characteristics:

1. Plants of the new *Geranium* were more vigorous than plants of the female parent selection.
2. Plants of the new *Geranium* had single flowers whereas plants of the female parent selection had semi-double flowers.

In side-by-side comparisons conducted in Gilroy, Calif., plants of the new *Geranium* differed from plants of the male parent, the cultivar BFP-1700, in the following characteristics:

1. Plants of the new *Geranium* were more vigorous than plants of the cultivar BFP-1700.
2. Plants of the new *Geranium* had lighter green-colored leaves than plants of the cultivar BFP-1700.

The new *Geranium* can be compared to the cultivar, Americana White Splash, disclosed in U.S. Plant Pat. No. 9,317. However, in side-by-side comparisons conducted in Gilroy, Calif., plants of the new *Geranium* differed from plants of the cultivar Americana White Splash in the following characteristics:

1. Plants of the new *Geranium* had darker green-colored leaves than plants of the cultivar Americana White Splash.
2. Flowers of plants of the new *Geranium* were more open in form than flowers of plants of the cultivar Americana White Splash.
3. Flowers of plants of the new *Geranium* had smaller red purple spots than flowers of plants of the cultivar Americana White Splash.

**BRIEF DESCRIPTION OF THE PHOTOGRAPHS**

The accompanying colored photographs illustrate the overall appearance of the new cultivar, showing the colors as true as it is reasonably possible to obtain in colored reproductions of this type.
