U.S.C. 154(b) by 116 days.

(57) **ABSTRACT**

A new and distinct cultivar of *Echinacea purpurea* plant
named 'Little Giant' characterized by its unique flowers with
numerous red purple rays that radiate out, orange cone,
lovely fragrance, and an upright dwarf habit.

Botanical classification: *Echinacea purpurea*.
Variety designation: 'Little Giant'.

color descriptions are all based on The Royal Horticultural
Society Colour Chart.

The present invention relates to a new and distinct cultivar
of *Echinacea purpurea* and given the cultivar name 'Little
Giant'. *Echinacea* is in the family Asteraceae. This new
cultivar originated as a whole plant mutation in a mass
planting of *Echinacea purpurea* 'Ruby Giant' (an unpat-
ented plant) in the nursery trial fields in Canby, Oreg.

Botanical classification: *Echinacea purpurea*.
Variety denomination: 'Little Giant'.

This new *Echinacea purpurea* cultivar is distinguished
by:

Plant:

Type.—Herbaceous perennial.
Hardiness.—USDA Zones 4 to 9.
Size.—30 cm wide and 40 cm. tall to top of flowers.
Form.—Basal clump.

1. Large red purple flowers with a double row of ray
flowers.
2. Dwarf habit.
3. Lovely fragrance.
4. Ray flowers which spread out parallel to ground,
slightly ruffled.
5. Strong upright stems.
6. Good vigor.

Leaf:

Type.—Simple.
Shape.—Lanceolate.
Arrangement.—Alternate.
Blade length.—10 to 19 cm.
Width.—3 to 6 cm. at the widest part.
Margins.—Slightly undulate and broadly crenate.
Apex.—Acuminate.

This new cultivar has been reproduced only by asexual
propagation (division and tissue culture). Each of the prog-
eny exhibits identical characteristics to the original plant.
Asexual propagation by division and tissue culture using
standard micropropagation techniques with terminal and
lateral shoots, as done in Canby, Oreg., shows that the
foregoing characteristics and distinctions come true to form
and are established and transmitted through succeeding
propagations. The present invention has not been evaluated
under all possible environmental conditions. The phenotype
may vary with changes in the environment without a change
in the genotype of the plant.

Base.—Attenuate, continuing down petiole.

Texture.—Rough.

Vestiture.—Strigose.

Venation.—Pinnate.

Color.—Topside — Deep Green, Between Green 139A
and Yellow Green 147A. Bottom — Yellow Green
147B.

Petiole length.—8 to 11 cm if basal leaf, 0.5 to 1 cm if
cauline leaf.

Petiole vestiture.—Strigose.

Petiole color.—Greyed Purple 187B except Yellow
Green 146D on back.

Inflorescence:

Type.—Long stalked terminal heads.

Number of heads per plant.—12 in first flush.

Immature inflorescence.—While still developing the
ray petals are slightly upright and Red Purple 64A.
The closed disc is Greyed Purple 187A, occasionally
the very center may be Yellow Green 144A. Disc
size ranges from 4 cm to 4.8 cm wide.

BRIEF DESCRIPTION OF THE DRAWING

The photograph shows *Echinacea purpurea* 'Little Giant'
growing in the ground in field trials in the summer in Canby,
Oreg.

DETAILED PLANT DESCRIPTION

The following is a detailed description of the new *Echina-*
cea purpurea cultivar based on observations of a one-year-
old specimen growing in the trial fields in Canby, Oreg. The

Peduncle.—Strong and fibrous, makes a good cut
flower. Height: 40 cm. Diameter: 1 cm. near flower
head. Vestiture: Strigose. Color: Red Purple 187A.

Flower:

Type.—Perfect, zygomorphic in composite head.

Size.—12.5 cm. wide and 2 to 5 cm deep as disc enlarges.

Ray petals.—In 2 or 3 series, about 80, irregular in width and length, sometimes twisted, giving the flower a ruffled look. Occasionally flatten tubes. Shape: Oblong to narrowly oblong with the tip 2 to 3 toothed. Length: Varies on one head from 3.5 to 4.7 cm long. Width: 0.7 cm on long petals and 0.9 to 1 cm on shorter petals. Texture — Satiny, soft. Vestiture — Glabrous except for bottom side where sparsely strigose.

Disc.—Average number of disc florets between 450 and 500. Shape — Convex becoming conic. Size — 4.8 to 5 cm wide and becoming 3.5 cm deep with maturity. Flower — 1.2 cm long, Yellow Green 146D, 5 lobed, each flower with one persistent, very stiff bract, 1.6 cm long, which gives the black to orange disc color. Pistil — 1 per floret, in ray and disc florets, 0.5 cm long, extruding, 2-branched stigma, stigma and style are Greyed Purple 187A, ovary is yellow green tinged with Greyed Purple 187A. Stamen — 5 in number, in ray and disc florets, 3 mm long, Greyed Purple 187A, anthers oval, 0.1 mm long, Orange 25C. Pollen color — No pollen, male sterile.

Color.—Ray, topside — Red Purple 64A. Ray, bottom side — Red Purple 59C. Disc — Greyed Purple 187A before opening and bracts Orange 25B with dark red tips, Red 46A to Greyed Purple 187A.

Bracts (at the base of each head).—Involucral bracts in six to seven leafy series, lobes lanceolate in shape, reflexed, strigose, area 3.5 to 5 cm wide.

Bract size.—0.3 cm wide and 0.6 to 0.8 cm long.

Bract color.—Yellow Green 147A.

Bloom period.—July through September in Canby, Oreg.

Fragrance.—Lovely.

Lastingness.—Each flower head lasts two to three weeks on the plant.

Fruit and seed: None. Plant sterile.

Diseases and pests: *Echinacea* are prone to leaf miners, powdery mildew, bacterial spots, and gray mold. Vine weevils may attack roots.

COMPARISONS TO SIMILAR *ECHINACEA*

Compared to *Echinacea purpurea* 'Ruby Giant', an unpatented plant and the parent, the new cultivar is much shorter with longer thinner leaves. The flowers of the new cultivar are a deeper red purple in color.

Compared to *Echinacea purpurea* 'Kim's Knee-Hi' (U.S. Plant Pat. No. 12,242), the new cultivar is shorter with wider flower heads that stiffly radiate rather than rigidly reflex and are colored deep red purple rather than rosy pink to purple pink. The new cultivar also has more ray flowers.

I claim:

1. A new and distinct cultivar of *Echinacea purpurea* plant named 'Little Giant', as illustrated and described.
