(57) **ABSTRACT**

A new and distinct *Pittosporum* plant is provided. Attractive  
green foliage with irregular light yellow margins is displayed.  
The growth is vigorous. An upright and columnar growth  
habit is displayed. The new cultivar has been found to root  
very easily under customary mist propagation conditions.  
The plant is well suited for providing attractive ornamenta-  
tion when grown in the landscape.

**2 Drawing Sheets**

**1**

Botanical classification: *Pittosporum tenuifolium*.  
Varietal denomination: cv. Conpitto.

**SUMMARY OF THE INVENTION**

*Pittosporum tenuifolium* is recognized to be an ornamental  
evergreen shrub that is believed to have originated in New  
Zealand. It sometimes is identified as Tawhiwki or Kohuhu.

The new *Pittosporum* plant of the present invention was  
discovered at a plant nursery located at Watsonville, Calif.,  
U.S.A., while growing in a block of common *Pittosporum*  
*tenuifolium* plants (non-patented in the United States) which  
had been grown from seed. Accordingly, the new plant was  
discovered in a cultivated state within a plant nursery. The  
new cultivar of the present invention is believed to be a chance  
seedling of unknown parentage. I was primarily attracted to  
the single plant of the present invention in view of the dis-  
tinctive appearance of its foliage. Had I not discovered and  
preserved this plant, it would have been lost to mankind.

The new cultivar has been carefully preserved and has been  
evaluated to confirm that its characteristics are reliably  
expressed.

It was found that the new *Pittosporum* plant of the present  
invention displays the following combination of characteris-  
tics:

- (a) displays vigorous growth,
- (b) forms attractive variegated green foliage with irregular  
light yellow margins,
- (c) displays an upright and columnar growth habit, and
- (d) is well suited for providing attractive ornamentation  
when grown in the landscape.

The new cultivar can be found to root very easily under  
customary mist propagation conditions.

**2**

The new cultivar has been grown in U.S.D.A. Hardiness  
Zone No. 8 and above.

The new cultivar can be distinguished from common  
*Pittosporum tenuifolium* plants in view of its variegated  
leaves. Also, the new cultivar can be readily distinguished  
from previously known cultivars which display variegated  
leaves, such as ‘Marjorie Channon’ (unpatented) and ‘Silver  
Queen’ (unpatented) cultivars. More specifically, the margins  
of the leaves of the new cultivar possess light yellow coloration  
unlike the margins of the previously known cultivars. The  
leaf margins of the ‘Marjorie Channon’ cultivar are more  
cream colored and the leaf margins of the ‘Silver Queen’  
cultivar are more white. Also, the new cultivar is more colum-  
nar than the ‘Marjorie Channon’ cultivar.

The new cultivar of the present invention can be grown to  
advantage to provide distinctive ornamentation in the land-  
scape.

Asexual reproduction of the new cultivar by the rooting of  
cuttings has been carried out at Watsonville, Calif., U.S.A.,  
and at West Grove, Pa., U.S.A. Such propagation has con-  
firmed that the unique combination of characteristics of the  
new cultivar has been stably established and is well transmit-  
ted to successive generations. The new cultivar asexually  
reproduces in a true-to-type manner.

The new cultivar has been named ‘Conpitto’ and will be  
marketed under the PIROUETTE trademark.

**BRIEF DESCRIPTION OF THE PHOTOGRAPHS**

The accompanying photographs show as nearly true as it is  
reasonably possible to make the same in color illustrations of  
this character, typical plants of the new cultivar. The plants  
had been asexually reproduced by the rooting of cuttings.

FIG. 1 shows a close view of the distinctive variegated foliage of the new cultivar wherein the irregular light yellow margins are apparent.

FIG. 2 shows a typical young container grown plant of the new cultivar wherein the columnar growth habit has begun to appear.

#### DETAILED DESCRIPTION

The following is a detailed description of the new cultivar of the present invention which was prepared during the spring while observing unpruned plants having an age of approximately three years, while growing in five-gallon containers outdoors near West Grove, Pa., U.S.A. Color terminology is in accordance with The R.H.S. Colour Chart (1996) of The Royal Horticultural Society, London, England, except when general color terms are used which are to be accorded their customary dictionary significance.

Type: Perennial evergreen shrub.

Plant:

*Growth habit.*—Upright and columnar, and moderately vigorous.

*Height.*—Has been observed up to approximately 1.5 m, and is estimated to have a mature height of approximately 2.5 to 4 m.

*Width.*—Approximately 2.4 m.

*Primary branches.*—Commonly approximately 72.5 cm in length on average, and approximately 12 mm in diameter on average.

*Lateral branches.*—Commonly approximately 30 cm in length on average, and approximately 6 mm in diameter on average.

*Branch texture.*—Smooth and glabrous.

*Branching habit.*—Free, dense, and bushy.

*Roots.*—Wiry, and light brown in coloration.

*Internodes.*—Commonly approximately 0.5 to 1 cm in length.

Foliage:

*Arrangement.*—Alternate, and simple.

*Shape.*—Elliptical.

*Size.*—Commonly approximately 3 cm in length on average, and approximately 2 cm in width on average.

*Margin.*—Entire.

*Apex.*—Acute.

*Base.*—Obtuse.

*Venation.*—Pinnate.

*Texture.*—Smooth and glabrous on both surfaces.

*Color.*—Fully expanded leaves on the upper surface commonly are near Yellow-Green Group 146B at the interior and bear irregular margins of near Greyed-Yellow Group 160C, and on the under surface are near Greyed-Green Group 194B at the interior and bear irregular margins of near Greyed-Yellow Group 160C.

*Petioles.*—Smooth, glabrous, leathery, approximately 5 mm in length, approximately 1 mm in diameter, and near Green Group 138B in coloration.

*Inflorescence:* Flower development has not been observed during observations to date.

*Development:*

*Hardiness.*—U.S.D.A. Hardiness Zone No. 8 and above.

*Heat tolerance.*—Good.

*Disease resistance.*—Relatively resistant to root rot pathogens, such as *Phytophthora*, during observations to date.

The new cultivar has not been observed to date under all possible environmental conditions. Accordingly, it is possible that the phenotype may vary somewhat with variations in the environment, such as temperature, light intensity, day length, and other cultural conditions without variance of the genotype.

I claim:

1. A new and distinct *Pittosporum* plant having the following combination of characteristics:

- (a) displays vigorous growth,
- (b) forms attractive variegated green foliage with irregular light yellow margins,
- (c) displays an upright and columnar growth habit, and
- (d) is well suited for providing attractive ornamentation when grown in the landscape;

substantially as illustrated and described.
