#### **ABSTRACT**

A photoreceptor comprising a photosensitive layer and a support, wherein said photosensitive layer contains a polycarbonate compound binder selected from the group consisting of Formula A and B,

wherein R<sub>1</sub> and R<sub>2</sub> are independently hydrogen, substituted or unsubstituted aliphatic, or a substituted or unsubstituted hydrocarbon ring, provided that at least one of  $R_1$  and  $R_2$  has at least 3 carbon atoms, Z represents a group of atoms necessary to constitute a substituted or unsubstituted carbon ring or a substituted or unsubstituted heterocylic ring, R3 to R10 in Formulas A and B are independently hydrogen, halogen, substituted or unsubstituted aliphatic, or a substituted or unsubstituted hydrocarbon ring, and n is a number from 10 to 1000.

## PHOTORECEPTOR HAVING POLYCARBONATE LAYERS AND PROCESS FOR THE PREPARATION THEREOF

Matter enclosed in heavy brackets [] appears in the original patent but forms no part of this reissue specification; matter printed in italics indicates the additions made by reissue.

This application is a continuation of application Ser. No. 377,819, filed July 11, 1989 now abandoned, is a continuation of application Ser. No. 204,096, filed June 8, 1988, now abandoned which is a U.S. Pat. No. Re. 4,637,971, issued Jan. 20, 1987 and claims the priority of Japanese 15 Application 28309/84, filed Feb. 16, 1984 as claimed in U.S. application, Ser. No. 700,671, filed Feb. 11, 1985, now issued as U.S. Pat. No. 4,637,971.

### **BACKGROUND OF THE INVENTION**

#### 1. Field of the Invention

The present invention relates to a photoreceptor, and more particularly to a photoreceptor (e.g., an electrophotographic photoreceptor) having a photosensitive layer comprising a carrier generating layer and a carrier 25 transport layer.

## 2. Description of the Prior Art

Those conventionally known electrophotographic photoreceptors are of the construction comprising in combination a carrier generating layer (hereinafter may 30 be abbreviated to "CGL") containing a carrer generating material (hereinafter may be abbreviated to "CGM") which absorbs visible rays to generate a charge carrier (hereinafter called simply "carrier") and a carrier transport layer (hereinafter may be abbrevi- 35 ated to "CTL") containing a carrier transport material (hereinafter may be abbreviated to "CTM" which transports either a negative carrier or a positive carrier or both carriers that have been generated in the CGL. Allotting in this way the necessary two different basic 40 functions, the carrier generation and the transport thereof, to the separate layers, respectively, that constitutes a photosensitive layer not only extends the selectable range of materials applicable to the construction of the photosensitive layer but also permits the indepen- 45 dent selection of the respective materials or types of materials capable of most effectively attaining the respective functions. Also, the above allotment enables the obtaining of an electrophotographic photoreceptor having characteristics required in the electrophoto- 50 configuration. graphic process, e.g., such excellent characteristics consisting of high surface electric potential obtained when charged, high charge retainability, high sensitivity to light, and high stability in the repeated use.

As the above photosensitive layer, for example, those 55 of the following constructions are known:

- (1) A construction comprising in combination a CGL containing amorphous selenium or cadminum sulfide and a CTL containing poly-N-vinyl carbazole.
- (2) A construction comprising in combination a CGL 60 containing amorphous selenium or cadmium sulfide and a CTL containing 2,4,7-trinitrilo-9-fluorenone.
- (3) A construction comprising in combination a CGL containing a perylene derivative and a CTL containing an oxadiazole derivative (as disclosed in U.S. Pat. No. 65 3,871,882).
- (4) A construction comprising in combination a CGL containing chlorodianeblue or methyl skaririum and a

CTL containing a pyrazoline derivative (Japanese Patent Publication Open to Public Inspection (hereinafter referred to as Japanese Patent O.P.I. Publication) No. 90827/1976).

- (5) A construction comprising in combination a CGL containing amorphous selenium or an alloy thereof and a CTL containing a polyarylalkane-type aromatic amino compound (Japanese Patent Application No. 147251/1977).
- (6) A construction comprising in combination a CGL containing a perylene derivative and a CTL containing a polyarylalkane-type aromatic amino compound (Japanese Patent Application No. 907/1978).

Attempts have been made to obtain an electrophotographic photoreceptor having excellent electrophotographic characteristics and excellent layer strength through the combined use of a low-molecular-weight organic compound as the charge transport material, an arbitrary charge generating material, and a highmolecular binder.

As the above high-molecular binder, polycarbonate is excellent in respect of the chargeability, repeatability, etc., the polycarbonate including, for example, those having the following structural formula unit:

$$\begin{array}{c|c}
CH_3 & O \\
C & C \\
CH_3 & O \\
CH_3 & O
\end{array}$$

The polycarbonate is of the structure wherein two methyl groups are symmetrically combined to the center carbon atom of bisphenol A. As a result of our additional investigation, however, it has now been found that, if the above polycarbonate is used to form a layer, a crystalline polycarbonate is deposited thereon during the layer formation to tend to cause protruded portions over the formed layer, the protruded portions producing trail marks in the coating to thereby decrease its yield or causing, when the carbonate is used as a photoreceptor, toner residue to remain uncleared at the protruded portions which tends to result in image troubles due to the so-called toner filming. The deposition of the crystalline polycarbonate is considered to result from the fact that, in the above polycarbonate, the groups coupled to the center carbon atom are of a lower alkyl, methyl, which produces a high-degree molecular chain

## **OBJECT OF THE INVENTION**

It is therefore an object of the present invention to provide a photoreceptor which is not only excellent in the chargeability, repeatability, and impressions (copying running life) but also free from the disadvantage in the characteristics, such as the undesirable toner filming, and the like.

## BRIEF DESCRIPTION OF THE DRAWINGS

The accompanying drawings show the examples of the present invention. FIGS. 1, 2, 3, 4 and 5 are the cross-sectional views of the electrophotographic photoreceptors of five examples, respectively. FIG. 6 is a schematic cross-sectional view of the immersion coating and drying apparatus. FIG. 7 is a schematic cross-sectional view of the apparatus when immersion coating.

# DETAILED DESCRIPTION OF THE INVENTION

The present invention relates to a photoreceptor which comprises a photosensitive layer in which either 5 a polycarbonate having the following Formula [A] or a polycarbonate having the following Formula [B] is contained as the principal component.

wherein R<sup>1</sup> and R<sup>2</sup> each is a hydrogen atom, a substituted or unsubstituted aliphatic group, a substituted or unsubstituted carbocyclic group, or a substituted or unsubstituted aromatic group, and at least either one of the R<sup>1</sup> and R<sup>2</sup> is a bulky group; R<sup>3</sup>, R<sup>4</sup>, R<sup>5</sup>, R<sup>6</sup>, R<sup>7</sup>, R<sup>8</sup>, R<sup>9</sup> and R<sup>10</sup> each is a hydrogen atom, a halogen atom, substituted or unsubstituted aliphatic group, or a substituted or unsubstituted aliphatic group; and n is from 10 to 1000.

wherein R<sup>3</sup>, R<sup>4</sup>, R<sup>5</sup>, R<sup>6</sup>, R<sup>7</sup>, R<sup>8</sup>, R<sup>9</sup> and R<sup>10</sup>, and n are as defined in Formula [A]; and Z is a substituted or unsubstituted carbocyclic groups or a group of atoms necessary to form a substituted or unsubstituted heterocyclic group.

According to this invention, a polycarbonate having the above Formula [A] or [B] is used as the principal component of the binder of the photosensitive layer, and to the center carbon atom of the bisphenol A of 45 the like. these polycarbonates are coupled R<sup>1</sup> and R<sup>2</sup>, at least either one of which is a bulky group, or formed a cyclic ring represented by the above Z, so that the presence of the R<sup>1</sup> and/or R<sup>2</sup> or Z prevents effectively the molecular chain of the polycarbonate from being configured in 50 a specific direction. For this reason, there occurs no crystalline polycarbonate deposition during the formation of the photosensitive layer, thus enabling to prevent possible decrease of the yield due to the abnormal protrusion and deterioration of such characteristics as 55 the image trouble due to the toner filming. This significant effect can be displayed more adequately if, in Formula [A], the R<sup>1</sup> and R<sup>2</sup> are different from each other or combined asymmetrically. In Formula [B], the ring formed by the Z contributes directly to the significant 60 effect.

The binder used in this invention, since it is of the polycarbonate type, is capable of providing the photo-receptor with the characteristics peculiar to polycarbonate excellent in the chargeability, repeatability, im- 65 pressions, and the like.

In the present invention, the polycarbonate having Formula [A] or [B] is desirable to be contained in an

amount of not less than 15% by weight, and preferably not less than 30% by weight of the whole binder of the photosensitive layer.

Of the above-mentioned polycarbonates to be used in this invention, in the one having Formula [A], it is essential that at least either one of the R<sup>1</sup> and R<sup>2</sup> is a bulky group. The bulky group is desirable to have not less than three carbon atoms, which functions as a three-dimentional obstruction to prevent the molecular chain configuration in a specific direction. The following are examples of the above-mentioned bulky group:

$$\begin{array}{c}
R^{11} \\
\end{array}$$

wherein  $R^{11}$  is a hydrogen atom, an alkyl group such as methyl, etc., or an alkyl ester group represented by  $-CH_2)_mCOOR$  (wherein R is an alkyl group, and m is equal to or more than 1).

- (3) An alkyl group represented by  $+C_mH_{2m+1}$  (wherein m is equal to or more than 4).
  - (4) An alkyl ester group represented by  $-CH_2$ - $_mCOOR^{12}$  (wherein  $R^{12}$  is an alkyl group, and m is equal to or more than 2).

In the case where either one of the R<sup>1</sup> and R<sup>2</sup> is a bulky group, the other may be a hydrogen atom or an alkyl group such as methyl.

Next, in Formulas [A] and [B], the R<sup>3</sup> through R<sup>10</sup> each is preferably hydrogen, a halogen such as Cl, Br, F, a saturated carbocyclic group such as cyclohexyl, or the like.

Also, in the polycarbonate of Formula [B], the Z may be ones to form 5- or 6-member carbocyclic or heterocyclic ring, the ring including cyclohexyl ring, cyclopentyl ring, etc. And into part of the ring may be introduced a substituent such as an acetyl group, an acetylamino group, or the like.

The following are examples of the polycarbonate applicable to the present invention.

10 (VII-24)

15

25

(VII-25) 20

(VII-26)

(VII-27)

Next, the [electron] carrier generating material 40 (CGM) of the [electron] carrier generating layer (CGL) includes those polycyclic quinone pigments having Formulas [VIII], [IX] and [X].

45 (VII-28) 50

(VII-29)

In the above formulas, X is a halogen atom, a nitro, cyano, acyl or carboxyl group; n is an integer of from zero to 4; and m is an integer of from zero to 6.

J(X)m

The use of the above-mentioned polycyclic quinone pigment as photoconductive particles enables to obtain 20 a high-speed, uniform-quality and hardly scratchable photosensitive layer, unlike in the case of those conventional inorganic-type particles or perylene-type pigments. Also, the use of a polycyclic quinone pigment refined by sublimation enables to obtain a photorecep- 25 tor of which the sensitivity is higher and in which the accumulated residual electric potential is smaller even when repeatedly used to make a large number of copies, resulting in the electric potential rise on the image area's surface being smaller, than that obtained by use of an 30 unrefined organic pigment, and therefore enables to obtain a fog-free, clear copy image. The sublimated pigment, however, tends to cause a trouble because its particle size is large. The sublimated polycyclic quinone pigment is desirable to be incorporated with its mean 35 particle size of not more than 2 µm into the photosensitive layer. That is, it has now been found that making the mean particle size of the above pigment (since the polycyclic pigment is in the needle crystal form, its longitudinal dimension is regarded herein as the mean 40 particle size) so minute as to be not more than 2  $\mu$ m enables to prevent the influence by the particle size upon the surface of the photoreceptor, to smooth the surface of the photoreceptor and also to stabilize the pigment dispersing agent. If the mean particle size of the 45 polycyclic quinone pigment exceeds 2 µm, protrusions tend to appear on the surface, while if the size is not more than 2  $\mu$ m, a smooth surface substantially free of protrusions can be obtained, and, further, the sedimentation of the particles in the dispersed liquid can be 50 minimized to thereby stabilize the liquid. As a result, a satisfactory photoreceptor free from destruction by discharge as well as from toner filming can be obtained. The mean particle size of the polycyclic pigment is preferably not more than 2  $\mu$ m, more preferably not 55 more than 1  $\mu$ m, and most preferably not more than 0.5 µm, provided, however, if the mean particle size is extremely small, on the contrary, crystal defects increase to deteriorate the sensitivity and repeatability of the resulting photoreceptor. Also because there is a 60 limit to making the particles minute, the lower limit of the mean particle size is desirable to be settled to 0.01 μm.

In order to obtain a polycyclic quinon pigment having such the mean particle size, it is desirable that the 65 crystal particles, after being grown in sublimation, be thoroughly pulverized by means of a pulverizer, the pulverizer including, for example, the ball mill, hammer

mill, sand grinder, centrifugal mill, colloid mill, jet mill, turbo mill, and the like.

The liquid for use in the formation of the photosensitive layer of this invention can be obtained by dispersing photoconductive particles of a mean particle size of not more than 2  $\mu$ m consisting of the above polycyclic quinone pigment into an appropriate organic solvent (which is allowed to contain a binder resin). Before and/or after this dispersing process, a carrier transport material may, if necessary, be added to thereby improve the electron transport function of the photo-carrier generating layer itself. In addition, the suitably applicable means to the dispersion includes, e.g., the ball mill, homogenizer, sand grinder, colloid mill, supersonic wave, and the like.

The following are examples of those [anthoan-throne-type] anthanthrone-type pigment compounds having the foregoing Formula [VIII].

$$\begin{pmatrix} O \\ O \\ O \\ O \end{pmatrix} (COC_6H_5)_2$$

The following are examples of those [pyranethrone-type] pyranthrone-type pigment compounds having the foregoing Formula [X]

(X-8)

-continued

Examples of the usable different CGM includes those bisazo compounds having the following Formula [XI].

$$A-N=N-Ar^{5}-C=C-Ar^{6}-N=N-A$$

Formula [Xi]

 $R^{36}R^{37}$ 

wherein Ar<sup>5</sup> and Ar<sup>6</sup> each is a substituted or unsubstituted carbocyclic aromatic cyclic group or a substituted or unsubstituted heterocyclic aromatic cyclic group; R<sup>36</sup> and R<sup>37</sup> each is an electron-attractive group or a hydrogen atom (wherein at least one of the R<sup>36</sup> and R<sup>37</sup> is an electron-attractive group such as —CN, a halogen such as —Cl, —NO<sub>2</sub>, or the like); A is

$$(Y)m$$
 $(X)n$ ,  $Z$ 
 $(Y)m$ 
 $(X)n$ ,  $Z$ 
 $(Y)m$ 

-continued

$$z = \frac{X}{X}$$
 or  $X = \frac{1}{N}$   $X = \frac{N}{N}$ 

10 (wherein X is a hydroxyl,

or -NHSO<sub>2</sub>-R<sup>41</sup>, wherein R<sup>39</sup> and R<sup>40</sup> each is a hydrogen atom, a substituted or unsubstituted alkyl group, R<sup>41</sup> is a substituted or unsubstituted alkyl group or a 20 substituted or unsubstituted aryl group); Y is a hydrogen atom, a halogen atom, a substituted or unsubstituted alkyl group, an alkoxy or carboxyl or sulfo group, a substituted or unsubstituted carbamoyl group or a substituted or unsubstituted sulfamoyl group, (provided when m is not less than 2, they are allowed to be different from one another); Z is a group of atoms necessary to form a substituted or unsubstituted carbocyclic aromatic cyclic ring or a substituted or unsubstituted heterocyclic aromatic ring; R38 is a hydrogen atom, a substituted or unsubstituted amino group, a substituted or unsubstituted carbamoyl group, or a carboxyl group or an ester group thereof; A' is a substituted or unsubstituted aryl group; n is an integer of 1 or 2; and m is an integer of from zero to 4.

Those compounds having Formula [XI] will be exemplified.

The preferred among those bisazo compounds having Formula [XI] are those having the following Formula [XIa].

CN Formula [XIa]
$$|A-N=N-Ar^5-C=CH-Ar^6-N=N-A$$

wherein Ar<sup>5</sup>, Ar<sup>6</sup> and A are as defined in Formula [XI].

The more preferred are those compounds in which the Ar<sup>5</sup> and Ar<sup>6</sup> each in Formula [XIa] is a substituted or unsubstituted phenyl group, provided the substituent thereof is one selected from the class consisting of an alkyl group such as methyl, ethyl, etc., an alkoxy group such as methoxy, ethoxy, etc., a halogen atom such as a chlorine atom, a bromine atom, etc., a hydroxyl group and a cyano group.

Examples of those bisazo compounds having Formula [XI] include the ones having the following structural formulas, but are not limited thereto.

mula [XII] may also be used as the CGM. wherein A" is

$$\tilde{z}$$
 $\tilde{z}$ 
 $\tilde{z$ 

wherein A" is

Z is a group of atoms necessary to form a substituted or unsubstituted aromatic carbocyclic ring or a substituted or unsubstituted aromatic heterocyclic ring; Y is a hydrogen atom, a hydroxyl or carboxyl or ester group thereof, a sulfo group, a substituted or unsubstituted carbamoyl group or a substituted or unsubstituted sulfamoyl group; R<sup>42</sup> is a hydrogen atom, a substituted or unsubstituted alkyl group, a substituted or unsubstituted amino group, a substituted or unsubstituted carbamoyl group, a carboxyl group or an ester group thereof or a

Those bisazo compounds having the following For- 15 cyano group; Ar7 is a substituted or unsubstituted aryl group; and R<sup>43</sup> is a substituted or unsubstituted alkyl group, a substituted or unsubstituted aralkyl group or a substituted or unsubstituted aryl group.

Among the bisazo compounds having the above Formula [XII], those carbazole group-containing bisazo compounds having the following Formula [XII'] are useful.

Formula [XII']
$$R^{45} \longrightarrow NHCO OH \qquad N=N-A''$$

$$R^{46} \longrightarrow NH \qquad R^{51}$$

$$R^{48} \longrightarrow R^{49}$$

wherein R<sup>44</sup> and R<sup>45</sup> each is an alkyl, alkoxy or aryl group; R<sup>46</sup>, R<sup>47</sup>, R<sup>48</sup>, R<sup>49</sup>, R<sup>50</sup>, and R<sup>51</sup> each is a hydrogen atom, a halogen atom, an alkyl, alkoxy, amino, hydroxyl or aryl group.

In the bisazo compound of Formula [XII'], the carbazole group thereinside is considered contributing to the sensitization of the photoreceptor, and provides an excellent sensitivity particularly in a longer wavelength region, and, in combination with the carbamoyl group 45 portion inside the same molecule, functions effectively as a coupler to display a satisfactory sensitivity over an extensive wavelength range, thus displaying excellent characteristics as the photorecepto for semiconductor laser use.

Examples of the bisazo compounds having Formula [XII] usable in this invention include, e.g., the compounds having the following structural formulas, but are not limited thereto.

Reference is now made to the drawings for illustrating the present invention.

The photoreceptor of this invention is constructed, for example, as is shown in FIG. 1. That is, on a conductive support 1 is formed a carrier generating layer 2 containing the previously mentioned CGM as the principal component thereof. And on the carrier generating layer 2 is superposedly provided a carrier transport layer 3 containing the previously mentioned CTM as 55 the principal component thereof, and thus both carrier generating layer 2 and carrier transport layer 3 constitute a photosensitive layer 4.

As the material of the conductive support 1 a sheet of metal such as, e.g., aluminum, nickel, copper, zinc, palladium, silver, indium, tin, platinum, gold, stainless steel, brass, or the like, may be used, but the usable materials are not limited to these. For example, as is shown in FIG. 2, on an insulating base 1A may be provided a conductive layer 1B to thereby form a conductive support 1. In this instance, as the base 1A those materials like a paper sheet, plastic sheet having flexibility as well as adequate strength against such stress as bending, tension, etc., are suitably usable. The forma-

tion of conductive layer 1B on the insulating base may be made by laminating a metal sheet, by the vacuum deposition of a metal, or by other methods.

The carrier generating layer 2 may be formed by the addition of an appropriate binder resin to the CGM or the further addition thereto of a material having a large transportability of a specific- or nonspecific-polarity carrier (i.e., carrier transport material).

In a practical manner, the carrier generating layer can be obtained by coating (or dipping) and drying a liquid prepared by dissolving or dispersing the CGM along or in combination with an appropriate binder resin into an appropriate solvent.

In this instance, a carrier transport material may also be added. The proportion by weight, in the addition, of the carrier generating material to the carrier transport material is 1 to 0-500, and particularly preferably 1 to 0-50.

The solvent or dispersion medium usable in the above procedure includes, e.g., n-butylamine, diethylamine, ethylenediamine, isopropanolamine, monoethanol-

114 113

triethylenediamine, N,Ntriethanolamine, dimethyl-formamide, acetone, methylethyl ketone, cyclohexanone, benzene, toluene, xylene, chloroform, 1,2-dichloroethane, dichloromethane, tetrahydrofuran, dioxane, methanol, ethanol, isopropanol, ethyl acetate, butyl acetate, dimethyl sulfoxide, and the like.

As the binder resin, although the previously mentioned polycarbonate of Formula [A] or [B] is suitable, other binder materials additionally usable include addition-polymerization-type resins, polyaddition-type res- 10 ins, and polycondensation-type type resins, such as, e.g., polyethylene, polypropylene, acryl resin, methacryl resin, vinyl chloride resin, vinyl acetate resin, epoxy resin, phenol resin, polyurethane resin, polyester resin, alkyd resin, those polycarbonate resins other than the 15 ones having Formulas [A] and [B], silicone resin, melamine resin, and the like, and further copolymerizationtype resins containing not less than two repeat units of the above-resins, including insulating resins such as, e.g., vinyl chloride—vinyl acetate copolymer, vinyl chloride-vinyl acetate-maleic anhydride copolymer, and the like, and high-molecular organic semiconductors such as poly-N-vinyl carbazole, and the like. The binder resin is desirable to contain the polycarbonate of 25 Formula [A] or [B] accounting for 15% by weight, and more preferably 30% by weight of the whole binder. And the proportion by weight of the binder resin to the CGM is preferably 1 to 0.1-0.01, and more preferably 1 to 0.1-10.

Further, the carrier generating layer may contain one or not less than two electron-receptive materials for the purpose of improving the sensitivity as well as for reducing the residual electric potential or fatigue of the layer when repeatedly used. The electron-receptive 35 material usable herein includes, e.g., succinic anhydride, maleic anhydride, dibromomaleic anhydride, phthalic anhydride, tetrachlorophthalic anhydride, tetrabromophthalic anhydride, 3-nitrophthalic anhydride, 4-nitrophthalic anhydride, pyromellitic anhydride, mel- 40 tetracyanoethylene, anhydride, tetlitic racyanoquinodimethane, o-dinitrobenzene, m-dinitrobenzene, 1,3,5-trinitrobenzene, paranitrobenzanitrile, picryl chloride, quinonechloroimide, chloranil, bromanil, dichlorodicyano-parabenzoquinone, anthraquinone, 45 dinitroanthraquinone, 2,7-dinitrofluorenone, 2,4,7-trini-2,4,5,7-tetranitrofluorenone, trofluorenone, fluorenylidene[dicyanomethylenemalonodinitrile], polynitro-9-fluorenylidene-[dicyanomethylenemalonodinitrile], picric acid, o-nitrobenzoic 50 acid, 3,5-dinitrobenzoic acid, pentafluorobenzoic acid,

bly 100 to 0.1-100. The thickness of the foregoing CGL2 thus formed is preferably from 0.005 to 20 µm, and particularly preferably from 0.05 to 5  $\mu m$ . If the thickness is less than 0.005 μm, no adequate sensitivity can be obtained, while if it 60 ing carrier transport phase (i.e., a mixture layer of the exceeds 20 µm, no adequate electron retainability can be obtained.

5-nitrosalicylic acid, 3,5-dinitrosalicylic acid, phthalic

acid, mellitic acid, and other large electron affinity-hav-

ing compounds. The proportion by weight of the car-

rier generating material is 100 to 0.01-200, and prefera- 55

The foregoing CTL3 can be formed in the same manner as in the CGL2 (i.e., by coating and drying a liquid prepared by dissolving or dispersing the foregoing 65 CTM alone or with a binder resin comprised principally of the foregoing polycarbonate). And different other CTMs may also be used in combination.

In this instance, the polycarbonate of Formula [A] or [B] should account for not less than 15% by weight, and preferably not less than 30% by weight of the whole binder. And the proportion by weight of the whole carrier transport material to the whole binder resin should be 1 to 0.1-100, and preferably 1 to 0.1-10.

Further, into the carrier transport layer may be incorporated the previously mentioned electron-receptive material for the purpose of improving the sensitivity and further reducing the residual electric potential or [fatige] fatigue when repeatedly used. In the case of adding the electron-receptive material to both carrier generating and carrier transport layers, the respective electron-receptive materials to both layers are allowed to be either quite the same or partially the same, and, if necessary, may be quite different. In addition, the electron-receptive material is allowed to be added to either one of the carrier generating layer or the carrier transport layer.

The adding proportion by weight of the electronreceptive material to the whole carrier transport layer is 0.01-100 to 100, and preferably 0.1-50 to 100.

The thickness of the carrier transport layer 3 thus formed is from 2 to 100 µm, and preferably from 5 to 30 μm.

This invention has been illustrated in above, making reference to the embodiment in FIG. 1 or 2. In this invention, in effect, the incorporation of the abovedescribed described components will be quite enough 30 for the carrier transport layer and the carrier generating layer to be combined therewith, and therefore the mechanical construction of them as of the electrophotographic photoreceptor is allowed to be arbitrarily selected.

For example, as is shown in FIG. 3, on conductive support 1 may be provided an interlayer 5, on the interlayer is formed carrier generating layer 2, and on the carrier generating layer is further formed carrier transport layer 3. The interlayer 5 is allowed to function to prevent the pouring of the free carrier from conductive support 1 into the photosensitive layer 4 as well as to function as an adhesion layer to render the photosensitive layer 4 adhere to the conductive support. Materials applicable to interlayer 5 include metal oxides such as aluminum oxide, indium oxide, etc., and high molecular materials such as acryl resin, vinyl chloride resin, vinyl acetate resin, epoxy resin, polyurethane resin, phenol resin, polyester resin, alkyd resin, polycarbonate resin, silicon resin, melamine resin, vinyl chloride-vinyl acetate-maleic anhydride copolymer resin, and the like.

Also, as is shown in FIG. 4, on conductive support 1 may, through or without through the foregoing interlayer 5, be formed carrier transport layer 3, and on this layer is provided carrier generating layer 2 to thereby construct photosensitive layer 4.

Further, FIG. 5 shows an example of the formation of a photosensitive layer consisting of a single layer prepared by dispersing the above carrier generating material into the above electron transport material-containcarrier generating and carrier transport phases). As the binder of this photosensitive layer the foregoing carbonate should be used in a quantity accounting for not less than 15% by weight, and preferably not less than 30% by weight of the whole binder.

In addition, the CGM and CTM usable in this invention are not limited to the above-described materials but include also those prior-art inorganic-type materials 115

such as, e.g., zinc oxide, lead oxide, titanium oxide, zinc sulfide, lead sulfide, cadmium sulfide, mercury sulfide, and the like.

In the formation by coating of the foregoing CTL (or CGL), a liquid containing the CTM (or further CGM) 5 and a binder comprised principally of the above polycarbonate is coated on a support (base) and then dried. In this instance, the binder concentration of the liquid should be not less than 5% by weight in accordance with this invention. The polycarbonate used in this 10 invention, since it is less crystallizable, will not be crystallized during the formation by coating of a photosensitive layer even if the concentration thereof in the coating liquid is increased to more than 5% by weight or even if the solvent used is a weak solvent. The increase 15 in the polycarbonate concentration to more than 5% by weight itself is a novel construction which is beyond the expectation in the prior art, and at the same time enables the improvement on the mechanical strength and impressions, etc., of the photosensitive layer because of 20 the increase in the polycarbonate ratio (content). However, in order to perfectly avoid the crystallization (or deposition) of the polycarbonate, the upper limit of the binder concentration should be set to 30% by weight. Also, the viscosity( $\eta$ ) of the liquid should be from 0.5 to 25 1000 cp, and more preferably from 3 to 300 cp.

The solvent usable herein includes ethylene chloride, tetrachloroethane, tetrahydrofuran, dioxane, chloroform, and the like. These solvents are relatively weak solvents, but, since the polycarbonate of this invention 30 is used as the binder, no crystallization of it will be produced in these solvents nor will the brushing of the coated layer due to the dew concentration possibly caused in the case of using a strong solvent be produced.

Next, the method for the preparation of the foregoing photoreceptor, e.g., the photoreceptor as shown in FIG. 1 will be described particularly with respect to the CTM (the method may be applied to the CGM as well).

In practicing this method, an immersion coating and 40 drying apparatus that is shown in FIG. 6 may be used.

A base, for example, a drum-like base 1, is vertically movably arranged inside a coating container 13 that contains a coating liquid 12 (e.g., a liquid containing the above CTM and binder), the base being held by a sup- 45 port rod 19 provided so as to pierce into the liquid. FIG. 6 shows a condition in which the base 1 is in the down position to be sufficiently immersed in the coating liquid 12. Provided above abutting on the container 13 is a cylindrical cover member 14, the diameter of which is 50 almost equal to that of the container 13 and which has pierced holes 15 in the side wall thereof for the purpose of controlling the solvent vapor concentration distribution and the inside of which is a drying region 24. Accordingly, as is shown in FIG. 7, the construction is 55 such that, by lifting up an arm 18, to which is fixed the support rod 19, from the immersion position as in FIG. 6 (in FIG. 7 the position is shown with the alternate long-and-short-dash line), the base 1 is taken up from the coating liquid 12 as shown with the solid line and 60 further with the alternate long-and-two-short-dashes line of FIG. 7, and then passes at a give speed through the drying region 24. If a new base is lowered to the down position from the base 1's up position taken out of the drying region 24 (i.e., inside the cover member 14) 65 and if the above-described operation is repeated, the immersion of the external surface of the base into the coating liquid 12 and the coating and drying of the

116

liquid can be carried out again. In addition, in the case where the base 1 is in the simply cylindrical form, the top and bottom openings thereof should be covered with lids 25 and 26 tightened by nuts 20 to thereby prevent the coating liquid 12 from getting into the base 1 (however, the top lid 25 need not necessarily be provided depending on the depth of the base 1's immersion).

On the other hand, the up-down motion mechanism of the above arm 18 is such that struts 21a and 21b are fixed in the vertical position onto a base plate 22, and the top ends of the struts are fixed to an upper base plate 23. To the upper base 23 a vertically downwardly extending feed screw shaft 16 is rotatably fixed through a bearing. The bottom end of this feed screw shaft 16 pierces through the center hole of a fixed plate 27 that is fixed to the struts 21a and 21b to be integrated with the rotary shaft of a motor 17 that is fixed to the underneath of the fixed plate 27. In the above arm 18 is formed a female thread 28 corresponding to the thread of the feed screw shaft, and the feed screw shaft is pierced rotating with its thread spiralling through the arm 18, whereby the arm 18, being supported by the feed screw shaft 16, is moved up and down with the rotation of the feed screw shaft by motor 17.

#### **EXAMPLES**

Examples of the present invention will be illustrated in detail below:

### EXAMPLE 1

On an aluminum-vacuum-deposited, 100 µm-thick polyethylene terephthalate conductive support was provided an interlayer having a thickness of about 0.1 µm, comprised of a vinyl chloride—vinyl acetate—maleic anhydride copolymer "Eslec MF-10" (manufactured by Sekisui Chemical Industry Co., Ltd.). Subsequently, 2 g of a bisazo compound having the foregoing Formula (XI-5) and 100 ml of 1,2-dichloroethane were taken together to be dispersed spending 12 hours by means of a ball mill. The thus obtained dispersed liquid was then coated on the above-prepared interlayer by means of a doctor blade, and then completely dried, whereby a CGL having a thickness of about 0.3 µm was formed.

On the other hand, 11.25 g of a styryl compound having the foregoing Formula (VI-18) and 15 g of a polycarbonate having the foregoing Formula (B-2) were dissolved into 100 ml of 1,2-dichloroethane, and the obtained solution was then coated on the aboveformed CGL by use of the doctor blade, and then dried at a temperature of 80° C. for an hour to form a CTL having a thickness of 15  $\mu$ m, whereby an electrophotographic photoreceptor on the basis of this invention was produced. This was regarded as Sample 1.

## **EXAMPLES 2 THROUGH 5**

Four different electrophotographic photoreceptor on the basis of this invention were prepared in quite the same manner as in Example 1 except that compounds having the foregoing Formulas (VIII-3), (IX-3), (X-4) and (XII-2) were used, respectively, in place of the (XI-5) used in the formation of the CGL of Example 1. These were regarded as Sample 2, Sample 3, Sample 4 and Sample 5, respectively.

## EXAMPLES 6 and 7

Two different electrophotographic photoreceptors of this invention were prepared in quite the same manner as in Example 1 except that compounds having the foregoing Formulas (A-1) and (A-10) were used in place of the (B-2) used for the formation of the CTL of Example 1. These were regarded as Sample 6 and Sample 7.

#### **EXAMPLE 8**

An electrophotographic photoreceptor of this invention was prepared in the same manner except that in the formation of CGL the same polycarbonate as that of the CTL of Example 2 was used as the binder, and a compound having the foregoing Formula (I-14) was used as the CTM. This was regarded as Sample 8.

# Comparative Example 1

A comparative electrophotographic photoreceptor 20 was prepared in the same manner as in Example 1 except that a known polycarbonate was used as the binder in place of the polycarbonate used in the formation of the CTL of Example 1. This was regarded as Comparative Sample 1.

The thus obtained electrophotographic photoreceptors (Samples 1 through 8 and Comparative Sample 1) each was examined with respect to the electrophotographic characteristics thereof by use of an Electrometer Model SP-428 (manufactured by Kawaguichi Denki 30 Seisakusho K.K.). That is, an Exposure E  $\frac{1}{2}$ (lux. sec) was examined which is necessary to attenuate to one half the electric potential  $V_A(V)$  when the surface of each photoreceptor was charged for 5 seconds at a charging electric potential of -6 KV and the electric potential (initial electric potential)  $V_1$  after the dark attenuation for 5 seconds of the photoreceptor. The examined results are as given in Table 1.

TABLE 1

Electrophotographic photoreceptor	V .4(V)	E ½(lux · sec)
Sample 1	-830	2.3
Sample 2	<b>—705</b>	3.0
Sample 3	-680	4.3
Sample 4	-635	3.7
Sample 5	<b>—785</b>	3.3
Sample 6	-810	2.4
Sample 7	-815	2.4
Sample 8	<b>-730</b>	3.2
Comparative sample !	<b>-795</b>	2.3

Further, each of the Samples 1-8 and Comparative Sample 1 was used in a dry-process electrophotographic copier U-Bix 2000R (manufactured by Konishiroku Photo Industry Co., Ltd.) to make copies in 55 succession. In the copying cycle, the black original copying electric potential Vb(V) and the white original copying electric potential Vw(V) obtained when the exposure aperture value was set to 1.0 were measured by use of an Electrostatic Voltometer Model 144D-ID 60 (manufactured by Monroe Electronics Inc.) immediately before development. The obtained results are as given in Table 2.

In addition, the term "black original copying electric potential" used in above implies the surface electric 65 potential of the photoreceptor obtained when a black paper having a reflection density of 1.3 was used as an original to make the above copying cycle, and the term

"white original copying electric potential implies the surface electric potential of the same photoreceptor obtained when a white paper is used.

TABLE 2

		Image electric potential					
	Electrophoto- graphic	Initial		After 5000 copies		Variance	
	photoreceptor	Vb	Vw	Vb	$\mathbf{V}\mathbf{w}$	ΔVb	$\Delta V_{W}$
10	Sample 1	- 680	-40	<b>-650</b>	-45	⊖30	⊕5
10	Sample 2	<b> 565</b>	-50	-530	-60	⊕35	0
	Sample 3	-580	<b>-75</b>	<b>- 555</b>	<del> 80</del>	⊕25	⊕5
	Sample 4	-535	<b>-70</b>	-500	<b>-70</b>	⊕35	0
15	Sample 5	665	-60	<b> 645</b>	<b>-70</b>	⊕20	⊕10
	Sample 6	-675	-45	<b> 64</b> 0	-50	⊖35	⊕5
	Sample 7	-670	-45	-635	-50	⊖35	⊕5
	Sample 8	-580	-60	-610	<b> 95</b>	⊕30	⊕35
	Comparative sample 1	<b>-645</b>	35	-610	40	⊖35	⊕5

On the other hand, the photoreceptors of the above examples were examined with respect to their surface conditions. The results obtained in the examination are as given in the following Table 3.

TABLE 3

Surface pro- trusions	Toner filming
None	None
Present	Present
	None None None None None None None None

From the results given in the above table it is apparent that the photoreceptors of the present invention have satisfactory surface smoothness and bring about no toner filming trouble.

## Comparative Example 2

A comparative electrophotographic photoreceptor (Comparative Sample 2) was prepared in the same manner except that the binder concentration in the coating liquid that was used in the formation of the CTL of Example 1 was changed to 4% by weight of the solvent. However, because the viscosity of the coating liquid was so low that the liquid flowed down, the thickness of the CTL was as small as 5 μm.

## What is claimed is:

[1. A photoreceptor comprising a photosensitive layer and a support wherein said photosensitive layer comprises a carrier generation layer and a carrier transport layer wherein said carrier generation layer and/or said carrier transport layer contains a polycarbonate compound represented by the following Formula (A) or (B) as a binder]

-continued

-continued

Formula [B]  $R_3$   $R_4$  C C  $R_5$   $R_6$   $R_9$   $R_{10}$ 

Ewherein R<sub>1</sub> and R<sub>2</sub> are independently hydrogen atom, 10 substituted or unsubstituted aliphatic group, or substituted or unsubstituted hydrocarbon ring provided that at least one of R<sub>1</sub> and R<sub>2</sub> has at least 3 carbon atoms, Z represents a group of atoms necessary for constituting a substituted or unsubstituted carbon ring or a substituted or unsubstituted heterocyclic ring, R<sub>3</sub> to R<sub>10</sub> in Formulas (A) and (B) are independently a hydrogen atom, a halogen atom, a substituted or unsubstituted aliphatic group or a substituted or unsubstituted hydrocarbon ring, and n is a number from 10 to 1000.

[2. The photoreceptor of claim 1, wherein said carrier generation layer contains a carrier generating material and said carrier transport layer contains a carrier transporting material.]

3. The photoreceptor of claim [2,] 33, wherein said carrier generation layer contains said polycarbonate compound at least 15 wt % by weight of the total amount of the binder contained therein.

4. The photoreceptor of claim 3, wherein said carrier generation layer contains said polycarbonate compound at least 30 wt % by weight of the total amount of the binder contained therein.

5. The photoreceptor of claim 3, wherein the ratio by weight of said carrier generating material against said total binder in said carrier generation layer is from 1:0.1 to 1:100.

6. The photoreceptor of claim 5, wherein the ratio by weight of said carrier generating material against said total binder in said carrier generation layer is from 1:0.1 40 to 1:10.

7. The photoreceptor of claim [2,] 33, wherein said carrier generating material is selected from the group consisting of bisazo compounds and polycyclic quinone compounds.

8. The photoreceptor of claim [2,] 33, wherein said carrier transport layer contains said polycarbonate compound at least 15 wt % by weight of the total amount of the binder contained therein.

9. The photoreceptor of claim 8, wherein said carrier 50 transport layer contains said polycarbonate compound at least 30 wt % by weight of the total amount of the binder contained therein.

10. The photoreceptor of claim 8, wherein the ratio by weight of said carrier transporting material against 55 said total binder in said carrier transporting layer is from 1:0.1 to 1:100.

11. The photoreceptor of claim 10, wherein the ratio by weight of said carrier transporting material against said total binder in said carrier transporting layer is 60 from 1:0.1 to 1:10.

12. The photoreceptor of claim [2,] 33, wherein said carrier transporting material is selected from the group consisting of hydrazone derivatives, carbazol derivatives, pyrazoline derivatives, styryl derivatives and 65 amine derivatives.

[13. The photoreceptor of claim 1, wherein said photosensitive layer is a single layer in which the carrier

generating material and carrier transporting material are dispersed.

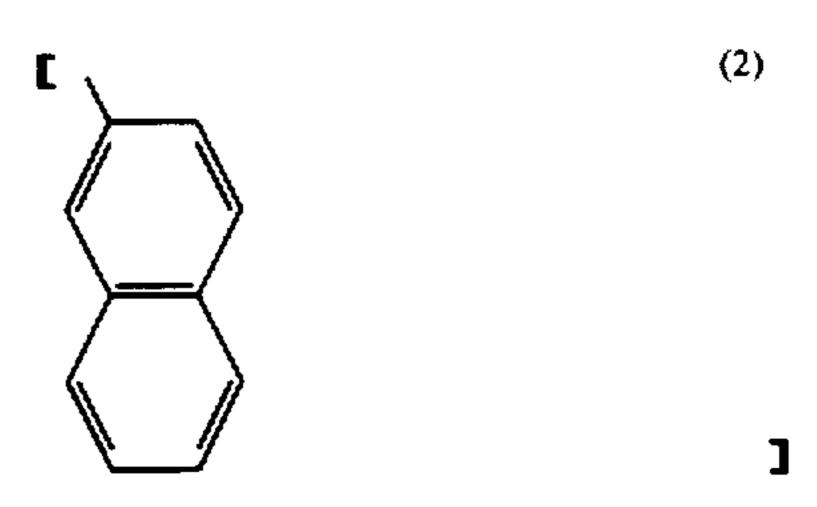

[14. The photoreceptor of claim 13, wherein said photosensitive layer contains said polycarbonate compound at least 15 wt % by weight of the total amount of the binder contained therein.]

[15. The photoreceptor of claim 14, wherein said photosensitive layer contains said polycarbonate compound at least 30 wt % by weight of the total amount of the binder contained therein.]

[16. The photoreceptor of claim 1, wherein at least one of said R<sub>1</sub> and R<sub>2</sub> is selected from the group consisting of ]

$$\mathbf{r}$$
 $\mathbf{r}$ 
 $\mathbf{r}$ 
 $\mathbf{r}$ 
 $\mathbf{r}$ 

[wherein,  $R_{11}$  is a hydrogen atom, an alkyl group, or an alkyl ester group represented by  $(-CH_2)_mCOOR'$  in which R' is an alkyl group, and m is equal to or more than 1, ]

 $\Gamma(3)$  An alkyl group represented by  $-C_mH_{2m+1}$  in which m is equal to or more than 4, and

(4) An alkyl ester group represented by —CH<sub>2</sub>)
mCOOR<sub>12</sub> in which R<sub>12</sub> is an alkyl group, and m is

equal to or more than 2.

[17. The photoreceptor of claim 1, wherein said R<sub>3</sub> to R<sub>10</sub> are independently a hydrogen atom, a halogen atom, an alkyl group or a saturated hydrocarbon ring.]

[18. The photoreceptor of claim 1, wherein said Z represents a group necessary for constituting a cyclopentyl ring or a cyclohexyl ring, said ring may have an acetyl group or acetylamido group.]

[19. The photoreceptor of claim 2, wherein said carrier generation layer has the thickness within the range of from 0.005  $\mu$ m to 20  $\mu$ m.]

[20. The photoreceptor of claim 2, wherein said carrier transport layer has the thickness within the range of from 2  $\mu m$  to 100  $\mu m$ .]

[21. The photoreceptor of claim 2, wherein said photoreceptor has a intermediate layer between said photosensitive layer and said support.]

[22. The photoreceptor of claim 2, wherein said support is composed of a sheet of metal such as aluminum, nickel, copper, zinc, palladium, silver, indium, tin, platinum, gold, stainless steel and brass.]

[23. The photoreceptor of claim 2, wherein said support consists of isolated substrate and conductive layer provided thereon.]

[24. A process for preparing a photoreceptor which comprises forming a photosensitive layer by coating a solution containing a semiconductor material and a binder on a support, wherein said solution contains a polycarbonate compound represented by the following formula [A] or [B] as said binder and the content of said

10

binder is in the range of from 5% to 30% by weight of a solvent

[25. The process of claim 24, wherein said semiconductor material is carrier generating material or carrier transporting material.]

26. The [process] method of claim [24,] 85, wherein the content of said polycarbonate is at least 15% by weight of the total amount of said binder contained in said solution.

[27. The process of claim 25, wherein the content of 30 said polycarbonate is at least 30% by weight of the total amount of said binder contained in said solution.]

28. The process of claim [26,] 85, wherein the viscosity of said solution is in the range of from 0.5 cp to 1000 cp.

29. The process of claim 28, wherein the viscosity of said solution is in the range of from 3 cp to 300 cp.

[30. The photoreceptor of claim 13, wherein said photoreceptor has a intermediate layer between said photosensitive layer and said support.]

[31. The photoreceptor of claim 13, wherein said support is composed of a sheet of metal such as aluminum, nickel, copper, zinc, palladium, silver, indium, tin, platinum, gold, stainless steel and brass.]

[32. The photoreceptor of claim 13, wherein said support consists of isolated substrate and conductive layer provided thereon.]

33. A photoreceptor comprising a photosensitive layer on a support, said photosensitive layer comprising a carrier generation layer and a carrier transport layer, said carrier generation layer containing a carrier generating material and a first binder, said carrier transport layer being formed by immersion coating and said carrier transport layer containing a carrier transporting material and a second binder which is a polycarbonate compound of at least one of the formulas

-continued

Formula [B]

wherein R<sub>1</sub> and R<sub>2</sub> are each independently a hydrogen atom, a substituted or unsubstituted aliphatic group, or a substituted or unsubstituted hydrocarbon ring provided that at least one of R<sub>1</sub> and R<sub>2</sub> has at least 3 carbon atoms;

wherein Z represents a group of atoms necessary to form a substituted or unsubstituted carbon ring or a substituted or unsubstituted heterocyclic ring,  $R_3$  to  $R_{10}$  are each independently a hydrogen atom, a halogen atom, a substituted or unsubstituted aliphatic group, or a substituted or unsubstituted hydrocarbon ring, and n is a number from 10 to 1000.

34. The method of claim 44 wherein said support is first coated with a charge generating layer.

35. The method of claim 44, wherein said support is a drum.

36. The method of claim 44 wherein said support is a drum vertically movably arranged inside a coating container containing a coating solution.

37. The method of claim 44 wherein immersion coating comprises immersing said support in a container containing said solution and then extracting said support therefrom.

38. The method of claim 44 wherein immersion coating comprises raising a container containing said support to immerse said support therein and then lowering said container to remove said support therefrom.

39. The method of claim 38 wherein a direction of said raising is vertical.

40. The method of claim 37 wherein said container has a cylindrical cover member.

41. The method of claim 38 wherein said container has a cylindrical cover member.

42. The method of claim 40 wherein said cover member has pierced holes in the side wall thereof.

43. The method of claim 41 wherein said cover member has pierced holes in the side wall thereof.

44. A method for preparing a photoreceptor which comprises a photosensitive layer on an endless support, said photosensitive layer comprising a carrier generation layer containing a first binder and a carrier transport layer, said method comprising immersion coating a solution forming said carrier transport layer containing a carrier transporting material and a second binder on said support, and said solution contains as said second binder a polycarbonate compound represented by

Formula [A] 
$$R_3$$

$$R_4$$

$$R_1$$

$$R_1$$

$$R_2$$

$$R_5$$

$$R_6$$

$$R_9$$

$$R_{10}$$

wherein R<sub>1</sub> and R<sub>2</sub> are independently a hydrogen atom, a substituted or unsubstituted aliphatic group, or a substituted or unsubstituted hydrocarbon ring provided that at least one of R<sub>1</sub> and R<sub>2</sub> has at least 3 carbon atoms, Z represents a group of atoms necessary for constituting a substituted or unsubstituted carbon ring or a substituent or unsubstituted heterocyclic ring, R<sub>3</sub> to R<sub>10</sub> in Formula [A] and [B] are independently a hydrogen atom, a halogen atom, a substituted or unsubstituted aliphatic group or a substituted or unsubstituted hydrocarbon ring, and n is a number from 10 to 1000.

45. The method of claim 44 wherein said Z represents a cyclohexyl ring.

46. The method of claim 44 wherein said solution containing said binder which is in the range of from 5% to 30% by weight of a solvent.

47. The photoreceptor of claim 33 wherein said polycarbonate compound is of the formula

Formula [C]

$$\begin{array}{c|c}
\hline
 & CH_2 & CH_2 \\
\hline
 & CH_2 & CH_2 \\
\hline
 & CH_2 & CH_2
\end{array}$$

48. The photoreceptor of claim 47 wherein said carrier 40 generation layer contains said polycarbonate compound at least 15 weight % by weight of the total amount of the binder contained therein.

49. The photoreceptor of claim 48 wherein said carrier 45 generation layer contains said polycarbonate compound at least 30% by weight of the total amount of the binder contained therein.

50. The photoreceptor of claim 48 wherein the ratio by weight of said carrier generating material against said total binder in said carrier generation layer is from 1:01 to 1:100.

51. The photoreceptor of claim 50 wherein the ratio by weight of said carrier generating material against said total binder in said carrier generation layer is from 1:0.1 to 1:10. 55

52. The photoreceptor of claim 47 wherein said carrier generating material is selected from the group consisting of bisazo compounds and polycyclic quinone compounds.

53. The photoreceptor of claim 47 wherein said carrier transport layer contains said polycarbonate compound at 60 least 15% weight % by weight of the total amount of the binder contained therein.

54. The photoreceptor of claim 53, wherein said carrier transport layer contains said polycarbonate compound at least 30 weight % by weight of the total amount of the 65 binder contained therein.

55. The photoreceptor of claim 53, wherein the ratio by weight of said carrier transporting material against said

total binder in said carrier transporting layer is from 1:0.1 to 1:100.

56. The photoreceptor of claim 55, wherein the ratio by weight of said carrier transporting material against said total binder in said carrier transporting layer is from 1:0.1 to 1:10.

57. The photoreceptor of claim 47, wherein said carrier transporting material is selected from the group consisting of hydrazone derivatives, carbazol derivatives, pyrazoline derivatives, styryl derivatives and amine derivatives.

58. The photoreceptor of claim 33 wherein said carrier generation layer and said carrier transport layer are formed on said support in this order outwardly from said support.

59. The photoreceptor of claim 47 wherein said carrier generation layer and said carrier transport layer are formed on said support in this order outwardly from said support.

60. The method of claim 44 wherein said carrier generation layer and said carrier transport layer are formed in this order from said support.

61. The photoreceptor of claim 33 wherein at least one of said  $R_1$  and  $R_2$  is selected from the group consisting of

$$- \left\langle \begin{array}{c} R_{11} \\ \end{array} \right\rangle$$

wherein,  $R_{11}$  is a hydrogen atom, an alkyl group, or an alkyl ester group represented by  $CH_2)_mCOOR'$  in which  $R^1$  is an alkyl group, and m is equal to or more than 1,

(3) an alkyl group represented by  $-C_mH_{2m}-1$  in which m is equal to or more than 4, and

(4) an alkyl ester group represented by  $-CH_2$ - $mCOOR_{12}$  in which  $R_{12}$  is an alkyl group, and m is
equal to or more than 2.

62. The photoreceptor of claim 33 wherein said  $R_3$  to  $R_{10}$  are independently a hydrogen atom, a halogen atom, an alkyl group or a saturated hydrocarbon ring.

63. The photoreceptor of claim 33 wherein said Z represent a group necessary for constituting a cyclopentyl ring or a cyclohexyl ring, said ring may have an acetyl group or acetylamido group.

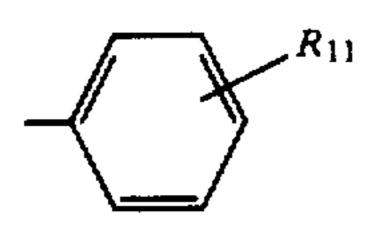

64. The photoreceptor of claim 33 wherein said carrier generation layer has the thickness within the range of from 0.005  $\mu m$  to 20  $\mu m$ .

65. The photoreceptor of claim 33 wherein said carrier transport layer has the thickness within the range of from 2 μm to 100 μm.

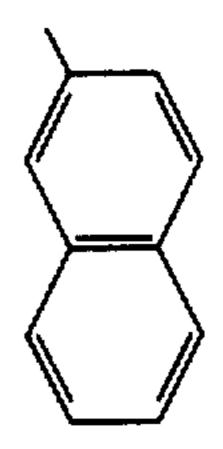

66. The photoreceptor of claim 33 wherein said photoreceptor has a intermediate layer between said photosensitive layer and said support.

67. The photoreceptor of claim 33 wherein said support is composed of a sheet of metal such as aluminum, nickel copper, zinc, palladium, silver, indium, tin, platinum, gold, stainless steel and brass.

- 68. The photoreceptor of claim 33 wherein said support consists of isolated substrate and conductive layer provided thereon.
- 69. The photoreceptor of claim 47 wherein said carrier 5 generation layer has the thickness within the range of from 0.005  $\mu m$  to 20  $\mu m$ .
- 70. The photoreceptor of claim 47 wherein said carrier transport layer has the thickness within the range of from  $^{10}$  2  $\mu m$  to 100  $\mu m$ .
- 71. The photoreceptor of claim 47 wherein said photoreceptor has a intermediate layer between said photosensitive layer and said support.
- 72. The photoreceptor of claim 47 wherein said support is composed of a sheet of metal such as aluminum, nickel copper, zinc, palladium, silver, indium, tin, platinum, gold, stainless steel and brass.
- 73. The photoreceptor of claim 47 wherein said support consists of isolated substrate and conductive layer provided thereon.
- 74. The method of claim 44 wherein at least one of  $R_1$  and  $R_2$  is selected from the group consisting of

wherein  $R_{11}$  is hydrogen, alkyl, or an alkyl ester of the 35 formula  $(CH_2)_mCOOR'$  in which  $R^1$  is alkyl and m is more than one;

an alkyl group of formula  $(C_mH_{2m-1})$  wherein m is at least 4; and

an alkyl ester group of the formula  $(CH_2)_mCOOR_{12}$  wherein  $R_{12}$  is alkyl and m is at least 2.

75. The method of claim 44 wherein said  $R_3$  to  $R_{10}$  are independently a hydrogen atom, a halogen atom, an alkyl group or a saturated hydrocarbon ring.

76. The method of claim 44 wherein said Z represents a group necessary for constituting a cyclopentyl ring or a cyclohexyl ring, said ring may have an acetyl group or acetylamido group.

77. The method of claim 44 wherein said carrier generation layer has the thickness within the range of from 0.005  $\mu m$  to 20  $\mu m$ .

78. The method of claim 44 wherein said carrier transport layer has the thickness within the range of from 2 µm to 100 µm.

79. The method of claim 44 wherein said photoreceptor has a intermediate layer between said photosensitive layer and said support.

80. The method of claim 44 wherein said support is composed of a sheet of metal such as aluminum, nickel copper, zinc, palladium, silver, indium, tin, platinum, gold, stainless steel and brass.

81. The method of claim 44 wherein said support consists of isolated substrate and conductive layer provided thereon.
