The present invention relates to novel 4-benzoylpyrazole derivatives and selective herbicides containing such derivatives as active ingredients, which are useful particularly as upland field herbicides.

Various herbicides have been developed for practical use from extensive research and development of herbicides for many years, and such herbicides have contributed to a reduction of the labor force required for controlling weeds or to improvement of the productivity of agricultural or horticultural plants.

Even now, it is still desired to develop a new herbicide having superior herbicidal properties. In particular, it is desired to develop an agricultural or horticultural herbicide which is capable of selectively controlling weeds without adversely affecting the crop plant and at a low dose. However, conventional herbicides do not necessarily provide such desired herbicidal properties.

On the other hand, certain compounds of 4-benzoylpyrazole derivatives are known to have herbicidal activities. For example, pyrazolate (common name) and pyrazoxyfen (common name) are practically used as herbicides for paddy fields. While exhibiting excellent herbicidal activities as paddy field herbicides, these compounds are not suitable as upland herbicides since their herbicidal activities are weak against weeds of upland fields. Among 4-benzoylpyrazole derivatives, it is desired to develop a superior compound useful as an upland field herbicide.

The present invention provides a pyrazole derivative having the formula:

When Q is a hydrogen atom, the compound may
readily from a salt with a metal or with an organic base.

As such a metal, sodium, potassium, calcium, lithium,
barium, magnesium, iron, copper, nickel or manganese
may be mentioned. 55

As such an organic base, methylamine, dimethylam-
ine, trimethylamine, ethylamine, diethylamine, triethyl-
amine, n-propylamine, di-n-propylamine, i-propyla-
mine, di-i-propylamine, n-butylamine, i-butylamine,
sec-butylamine, tert-butylamine, piperidine, pyrroli-
dine, morpholine, pyridine, N,N-dimethylaniline or
choline may be mentioned. 60

In the course of researches on the herbicidal proper-
ties of various organic compounds with an aim to de-
velop useful herbicides, the present inventors have
found that the above-mentioned compound of the pres-
ent invention exhibits excellent herbicidal activities
against narrow leaf weeds (gramineous and cypera-

aceous weeds) and against broad leaf weeds and no substantial phytotoxicity against useful plants e.g. crop plants such as *Zea mays* (corn), *Sorghum bicolor* (sorgo), *Triticum spp* (wheat) and *Hordeum vulgare* (barley). The present invention has been accomplished on the basis of this discovery.

The compound of the present invention exhibits strong herbicidal activities in each of soil treatment, soil incorporation treatment and foliage treatment. On the other hand, it exhibits no phytotoxicity against crop plants such as *Zea mays*, *Sorghum bicolor*, *Triticum spp* and *Hordeum vulgare* in a practical application in any of soil treatment, soil incorporation treatment and foliage treatment. Thus, the compound of the present invention has high selectivity and it is extremely effective for controlling weeds during the cultivation of these crop plants. Namely, the compound of the present invention exhibits strong herbicidal activities against noxious weeds such as *Setaria viridis* (green foxtail), *Echinochloa crus-galli* (barnyardgrass), *Amarathus lividus* (livid amaranth), *Polvgonum longisetum* (persicaria blumei gross), *Xanthium strumarium* (cocklebur), *Abutilon theophrasti* (velvet leaf) and *Cyperus esculentus* (yellow nutsedge), which develop during the cultivation of *Zea mays* or *Sorghum bicolor*. The herbicidal activities against gramineous weeds and *Cyperus esculentus* are remarkably high and extremely unique. Heretofore, during the cultivation of *Zea mays* or *Sorghum bicolor*, it has been common to employ atrazine or cyanazine as a triazine-type herbicide, or alachlor or metolachlor as an acid anilide type herbicide. However, atrazine and cyanazine have poor herbicidal activities against gramineous weeds although they show high activities against broad leaf weeds, and their activities against *Cyperus esculentus* are very low. On the other hand, alachlor and metolachlor have poor activities against broad leaf weeds although their activities against gramineous weeds are high, and their activities against *Cyperus esculentus* are very poor. Thus, it has been difficult to eradicate all the weed species by a single application of such herbicides.

As a result of various studies, the present inventors have found the compound of the present invention which exhibits excellent herbicidal effects against a wide range of weeds, and the present invention has been accomplished on the basis of this discovery. The compound of the present invention also has a feature that it exhibits no phytotoxicity against crop plants such as *Zea mays*, *Sorghum bicolor*, *Triticum spp* and *Hordeum vulgare* and thus can safely be applied to the fields for such crop plants.

Further, the compound of the present invention includes a compound which shows selectivity between *Oryza sativa* (rice) and *Echinochloa crus-galli* (barnyardgrass), and it also includes a compound having selectivity for a useful plant such as *Goxypium spp* (cotton), *Beta vulgaris* (sugar beat) or *Clycine max* (soybean).

Heretofore, it has been known that 4-benzoylpyrazole derivatives have excellent herbicidal activities. For example, pyrazolate (common name) is commercially available and widely used for practical application. However, such conventional herbicides are restricted in their application to paddy fields, and their activities are very poor in their application to upland fields. Whereas, as a result of extensive research for many years on 4-benzoylpyrazole derivatives, the present inventors have finally found that the compound of

the present invention which simultaneously satisfies the various conditions for substituents in the structure as specified above, exhibits strong herbicidal activities in the application to upland fields in each of soil treatment, soil incorporation treatment and foliage treatment. It has been found that the compound of the present invention exhibits particularly high activities against gramineous weeds and *Cyperus esculentus*.

The compound of the present invention can readily be prepared by any one of the following reactions.

9

-continued

In the above formulas, A, B, V, W, X, Y, Z and Q are as defined above, E is a halogen atom, a methanesul-

fonyloxy group or a p-toluenesulfonyloxy group. Further,

and may be represented by either formula.

Reaction scheme (1) represents a reaction wherein benzoic acid having suitable substituents and 5-hydroxypyrazole are reacted in an inert solvent in the presence of a condensation agent and a base to obtain 4-benzoyl-5-hydroxypyrazole. The condensation agent is used in an amount of from 1.0 to 1.5 mols per mol of the benzoic acid and pyrazole. As the condensation agent, N,N'-dicyclohexylcarbodiimide may be mentioned. The solvent may be any solvent so long as it is inert to the reaction. Particularly preferred is tert-butyl alcohol, tert-amyl alcohol or isopropyl alcohol. The base may not necessarily be required. However, in general, the yield can be improved by using a base. There is no particular restriction as to the base, but potassium carbonate or sodium carbonate may preferably be employed. The reaction temperature may range from room temperature to boiling point of the solvent, but is preferably from 50° to 100° C.

The reaction time is usually from 0.5 to 20 hours.

Reaction scheme (2) shows a reaction wherein benzoyl chloride having suitable substituents and 5-hydroxypyrazole are reacted to form a benzoyl ester, which is then rearranged to a 4-benzoyl compound.

The benzoyl esterification can be accomplished in an inert solvent (such as an aromatic hydrocarbon, a fatty acid ester, a halogenated hydrocarbon, an ether, acetonitrile, dimethylsulfoxide or N,N'-dimethylformamide) or in a two phase system with such a solvent and water or in a mixture of such solvents in the presence of a suitable dehydrochlorinating agent (e.g. an inorganic base such as sodium hydroxide, potassium hydroxide or sodium hydrogencarbonate, or an organic base such as pyridine or triethylamine) at a temperature of from room temperature to 100° C. for from 10 minutes to 5 hours.

The rearrangement reaction can be accomplished by means of a Lewis acid such as anhydrous aluminum chloride or a base. As the base, potassium carbonate, calcium hydroxide or sodium carbonate may be used. The Lewis acid or base is used usually in an amount of from 1 to 10 mol times.

No solvent is required. However, in some cases, it is advantageous to use a solvent having a suitable boiling point to improve the operation efficiency or the yield. As such an advantageous example, use of dioxane, toluene or xylene diglyme, may be mentioned.

The reaction temperature is usually from 50° to 150° C., and the reaction time is usually from 15 minutes to 30 hours.

Reaction scheme (3) shows a reaction wherein a benzene derivative, a 5-hydroxypyrazole derivative and carbon tetrachloride are condensed in the presence of a Lewis acid in an inert solvent or in the absence of a solvent, followed by hydrolysis to obtain a 4-benzoyl-5-hydroxypyrazole derivative. As the Lewis acid, anhydrous aluminum chloride or anhydrous aluminum bro-

side in an amount of at least the theoretical amount for the reaction is preferred. The solvent may be of any type so long as it is inert to the reaction. However, a chlorine-type solvent such as methylene chloride, dichloroethane or tetrachloroethane is preferred. The temperature for condensation may range from 0° C. to the boiling point of the solvent, but it is preferably from 10° to 80° C. The hydrolysis is conducted in the presence of hydrochloric acid or sulfuric acid. The temperature for the hydrolysis is preferably from room temperature to 100° C. The time for the hydrolysis is usually from 0.1 to 10 hours.

Reaction scheme (4) shows a reaction wherein a benzoyl cyanide derivative and a 5-hydroxypyrazole derivative are reacted in the presence of a Lewis acid and a base in an inert solvent or in the absence of a solvent to obtain a 4-benzoyl-5-hydroxypyrazole. As the Lewis acid, zinc chloride, aluminum chloride or aluminum bromide may be used. As the base, pyridine or triethylamine may be mentioned. The Lewis acid and the base are used usually in an amount of from 1 to 10 mol times. As the solvent, methylene chloride, dichloroethane or tetrachloroethane may be mentioned. The reaction temperature is usually from 0° to 80° C., preferably from 10° to 50° C. The reaction time is from 0.5 to 20 hours.

Reaction scheme (5) shows a reaction wherein 4-benzoyl-5-hydroxypyrazole is condensed with a halide, a methanesulfonic acid ester or a p-toluenesulfonic acid ester.

For this reaction, it is preferred to employ from 1 to 3 mol times of a dehydrohalogenating agent. As such a dehydrohalogenating agent, an inorganic base such as sodium hydroxide, potassium hydroxide, sodium carbonate, sodium hydrogencarbonate or potassium carbonate, or an organic base such as pyridine or triethylamine, may be mentioned.

There is no particular restriction as to the solvent so long as it is inert to the reaction. A wide range of solvents including an aromatic hydrocarbon, a fatty acid ester, a halogenated hydrocarbon, an ether, a ketone, an aliphatic hydrocarbon, acetonitrile, dimethylsulfoxide and dimethylformamide may be used.

The reaction temperature may be optionally selected within a range of from room temperature to the boiling point of the solvent. The reaction time is usually from 30 minutes to 30 hours.

Reaction scheme (6) shows a reaction wherein 4-benzoyl-5-hydroxypyrazole is converted to a 5 halogeno compound by a halogenating agent, or to a methanesulfonate compound or a p-toluenesulfonate compound by methane sulfonyl chloride or p-toluenesulfonyl chloride, followed by condensation with a suitable alcohol or acid.

As the halogenating agent, phosphorus oxychloride, phosphorus pentachloride or thionyl chloride may be mentioned.

As the solvent, a wide range of solvents inert to the reaction, such as dimethylformamide, may be employed. However, the reaction can be conducted without any solvent.

The reaction temperature is preferably from 30° to 150° C, and the reaction time is usually from 30 minutes to 10 hours. In some cases, the reaction time may be shortened or the yield may be improved by an addition of a dehydrohalogenating agent.

The condensation reaction with an alcohol or acid is conducted by an addition of a dehydrohalogenating agent.

As such a dehydrohalogenating agent, a base such as sodium hydroxide, potassium hydroxide, sodium carbonate, potassium carbonate, sodium alkoxide or sodium hydride may be employed.

The solvent may be any solvent which is inert to the reaction (such as an aromatic hydrocarbon, an ether, a ketone or N,N'-dimethylformamide). The reaction temperature may be selected within a range of from room temperature to the boiling point of the solvent.

The substituted benzene derivatives used as the starting materials for the compounds of the present invention have novel structures, and they may readily be prepared by a proper combination of various known syntheses. For instance, compounds wherein the substituent Z in the benzene ring is $-\text{S}(\text{O})_n\text{CH}_3$ can be prepared in accordance with the following reaction schemes.

In the above formulas, X and Y are as defined above, and Hal is a halogen atom.

Now, the preparation of the substituted benzene derivatives and pyrazole derivatives will be described in detail with reference to Examples. However, it should be understood that the present invention is by no means restricted by such specific Examples.

When the compound of the present invention is to be used as an agricultural or horticultural herbicide, it is usually mixed with a suitable carrier, for instance, a solid carrier such as clay, talc, bentonite or diatomaceous earth, or a liquid carrier such as water, an alcohol (such as benzene, toluene or xylene), a chlorinated hydrocarbon, an ether, a ketone, an ester (such as ethyl acetate) or an acid amide (such as dimethylformamide). If desired, an emulsifier, a dispersing agent, a suspending agent, a penetrating agent, a spreader or a stabilizer may be added to prepare an optional formulation such as a liquid formulation, an emulsifiable concentrate, a wettable powder, a dust, a granule or a flowable.

Further, if desired, other herbicides, various insecticides, bacteriocides, plant regulating agents or synergism agents may be combined at the time of the prepara-

tion of the formulations or at the time of the application of the herbicides.

As other herbicides to be combined with the herbicide of the present invention, there may be mentioned, for instance, compounds disclosed in Farm Chemicals Handbook, the 73rd Edition (1987). Among them, there may be mentioned, for example, atrazine, cyanazine, alachlor, metolachlor, EPTC, 2,4-D, butylate, dicamba, bromoxynil, tridiphane, isoproturon, chlortoluron, triallate, difluphenican, diclofop methyl, diphenzoquat, imazamethabenz methyl, ioxynil, methabenzthazuron, fluroxypil, chlorsulfuron and N-[(4,6-di(difluoromethoxy)pyrimidin-2-yl)aminocarbonyl]-2-methoxycarbonylbenzenesulfonamide. N-[(4,6-dimethoxypyrimidin-2-yl)aminocarbonyl]-3-chloro-4-methoxycarbonyl-1-methylpyrazole-5-sulfonamide or N-[(4,6-dimethoxypyrimidin-2-yl)aminocarbonyl]-3-bromo-4-methoxycarbonyl-1-methylpyrazole-5-sulfonamide as disclosed in U.S. Pat. No. 4,668,277, or N-[(4,6-dimethoxypyrimidin-2-yl)aminocarbonyl]-3-dimethylaminocarbonylpyridine-2-sulfonamide as disclosed in Japanese Unexamined Patent Publication No. 223180/1987 may also be combined with the herbicide of the present invention.

The dose varies depending upon the application site, the season for application, the method for application, the type of the crop plant, etc. In general, however, the dose is usually within a range of from 0.001 to 10 kg per hectare as the amount of the active ingredient.

In their use, the above wettable powder, emulsifiable concentrates, flowables or liquid formulations are diluted with water from 50 to 1,000 times and applied so that the respective active ingredients will be from 0.001 to 5 kg per hectare.

The compounds of the present invention are applicable not only to agricultural and horticultural fields such as upland fields, paddy fields and orchards, but also to non-agricultural fields such as athletic fields, vacant fields and railway sides for the control of various weeds. The dose in their application varies depending upon the application site, the season for application, the type of crop plants, etc. However, it is usually within a range of from 0.001 to 5 kg per hectare.

Now, the herbicidal activities of the compounds of the present invention will be described with respect to specific Test Examples.

TEST EXAMPLE 1:

Test on the herbicidal effects in soil treatment

A plastic box having a length of 15 cm, a width of 22 cm and a depth of 6 cm was filled with a sterilized diluvium soil, and seeds of *Echinochloa crus-galli*, *Setaria viridis*, *Eleusine indica*, *Digitaria adscendens*, *Panicum dichotomiflorum*, *Abutilon theophrasti*, *Amaranthus lividus*, *Polygonum longisetum* and *Zea mays* were sown, and tubers of *Cyperus esculentus* were further planted. The soil was covered thereon in the thickness of about 1.5 cm, and then a herbicide solution was applied onto the surface of the soil uniformly so that the active ingredient was distributed at a predetermined concentration. The herbicide solution was prepared by diluting the wettable powder, the emulsifiable concentrate, the liquid formulation or the flowable as described in the foregoing Formulation Examples with water and applied onto the entire soil surface by means of a small spray. Three weeks after the application of the herbicidal solution, the herbicidal effects against each weed were determined on the basis of the following standard ratings. The results thereby obtained are shown in Table 9. The Compound Nos. correspond to the Compound Nos. in Table 2.

Standard ratings

- 5: Growth control rate of more than 90% (almost completely withered)
- 4: Growth control rate of from 70 to 90%
- 3: Growth control rate of from 40 to 70%
- 2: Growth control rate of from 20 to 40%
- 1: Growth control rate of from 5 to 20%
- 0: Growth control rate of less than 5% (almost non-effective)

The above growth control rates were calculated by the following equation:

$$\text{Growth control rate (\%)} = \left(1 - \frac{T}{N} \right) \times 100$$

where

T: Weight of the weed growth above the soil surface of the treated area

N: Weight of the weed growth above the soil surface of the non-treated area

TEST EXAMPLE 2:

Test 1 on the herbicidal effects in foliage treatment

A plastic box having a length of 15 cm, a width of 22 cm and a depth of 6 cm was filled with a sterilized diluvium soil, and seeds of *Echinochloa crus-galli*, *Setaria viridis*, *Eleusine indica*, *Digitaria adscendens*, *Panicum dichotomiflorum*, *Xanthium strumarium*, *Abutilon theophrasti*, *Amaranthus lividus*, *Polygonum longisetum* and *Zea mays* were spot-wisely sown, and tubers of *Cyperus esculentus* were further planted. Then, the soil was covered thereon in a thickness of about 1.5 cm. When the various weeds and crop plant grew to the 2 or 3 leaf stage, a herbicidal solution was uniformly sprayed on the foliages so that the active ingredient was applied in a predetermined concentration.

The herbicidal solution was prepared by diluting the wettable powder, the emulsifiable concentrate, the liquid formulation or the flowable as described in the above Formulation Examples with water and applied onto the entire surface of the foliages of the weeds and the crop plants by a small spray. Two weeks after the application of the herbicide solution, the herbicidal effects against each weed and *Zea mays* were determined on the basis of the standard ratings described in Test Example 1. The results are shown in Table 10. The Compound Nos. in Table 10 correspond to the Compound Nos. in Table 2.

TEST EXAMPLE 3

Test 2 on the herbicidal effects in foliage treatment

Then, the soil was covered thereon in a thickness of about 1.5 cm. When the various weeds and crop plant grew to the 2 or 3 leaf stage, a herbicidal solution was uniformly sprayed on the foliages so that the active ingredient was applied in a predetermined concentration.

The herbicidal solution was prepared by diluting the wettable powder, the emulsifiable concentrate, the liquid formulation or the flowable as described in the above Formulation Examples with water and applied onto the entire surface of the foliages of the weeds and *Triticum aestivum* by a small spray. Two weeks after the application of the herbicide solution, the herbicidal effects against each weed and *Triticum aestivum* were determined on the basis of the standard ratings described in Test Example 1. The results are shown in Table 11. The Compound Nos. in Table 11 correspond to Compound Nos. in Table 2.
