**Matter enclosed in heavy brackets [ ] appears in the original patent but forms no part of this reissue specification; matter printed in italics indicates the additions made by reissue.**

## REFERENCE TO RELATED APPLICATIONS

The present application claims priority to U.S. Provisional application Serial No. 60/204,789, filed May 16, 2000 and U.S. provisional application Serial No. 60/268,283, filed Feb. 13, 2001. The disclosure of each of these applications is hereby incorporated herein by reference in its entirety.

## FIELD OF THE INVENTION

The present invention is related to chemical compositions, processes for the preparation thereof and uses of the composition. Particularly, the present invention relates to compositions that include substituted thioacetamides, and their use in the treatment of diseases, including treatment of sleepiness, promotion of wakefulness, treatment of Parkinson's disease, cerebral ischemia, stroke, sleep apneas, eating disorders, stimulation of appetite and weight gain, treatment of attention deficit hyperactivity disorder ("ADHD"), enhancing function in disorders associated with hypofunctionality of the cerebral cortex, including, but not limited to, depression, schizophrenia, fatigue, in particular, fatigue associated with neurologic disease, such as multiple sclerosis, chronic fatigue syndrome, and improvement of cognitive dysfunction.

## BACKGROUND OF THE INVENTION

The compounds disclosed herein are related to the biological and chemical analogs of modafinil. Modafinil,  $C_{15}H_{15}NO_2S$ , also known as 2-(benzhydrylsulfinyl)acetamide, or 2-[(diphenylmethyl)sulfinyl]acetamide, is a synthetic acetamide derivative with wake-promoting activity, the structure of which has been described in French Patent No. 78 05 510 and in U.S. Pat. No. 4,177,290 ('290), and which has been approved by the United States Food and Drug Administration for use in the treatment of excessive daytime sleepiness associated with narcolepsy. Modafinil has been tested for treatment of several behavioral conditions in combination with various agents including apomorphine, amphetamine, reserpine, oxotremorine, hypnotics, yohimbine, 5-hydroxytryptophan, and monoamine oxidase inhibitors, as described in the cited patents. A method of preparation of a racemic mixture is described in the '290 patent and a method of preparation of a levorotatory isomer is described in U.S. Pat. No. 4,927,855 (both incorporated herein by reference). The levorotatory isomer is reported to be useful for treatment of hypersomnia, depression, Alzheimer's disease and to have activity towards the symptoms of dementia and loss of memory, especially in the elderly.

The primary pharmacological activity of modafinil is to promote wakefulness. Modafinil promotes wakefulness in rats (Touret et al., 1995; Edgar and Seidel, 1997), cats (Lin et al., 1992), canines (Shelton et al., 1995) and non-human primates (Hernant et al, 1991) as well as in models mimicking clinical situations, such as sleep apnea (English bulldog sleep disordered breathing model) (Panckeri et al, 1996) and narcolepsy (narcoleptic canine) (Shelton et al, 1995).

Modafinil has also been described as an agent with activity in the central nervous system, and as a useful agent

in the treatment of Parkinson's disease (U.S. Pat. No. 5,180,745); in the protection of cerebral tissue from ischemia (U.S. Pat. No. 5,391,576); in the treatment of urinary and fecal incontinence (U.S. Pat. No. 5,401,776); and in the treatment of sleep apneas and disorders of central origin (U.S. Pat. No. 5,612,379). U.S. Pat. No. 5,618,845 describes modafinil preparations of a defined particle size less than about 200 microns. In addition, modafinil may be used in the treatment of eating disorders, or to promote weight gain or stimulate appetite in humans or animals (U.S. Provisional Patent Application No. 60/150,071, incorporated herein by reference), or in the treatment of attention deficit hyperactivity disorder (ADHD), or fatigue, especially fatigue associated with multiple sclerosis (U.S. Provisional Patent Application No. 60/149,612, incorporated herein by reference).

Several published patent applications describe derivative forms of modafinil and the use of modafinil derivatives in the treatment of various disorders. For example, PCT publication WO 99/25329 describes analogs of modafinil in which the phenyl groups are substituted with a F, Cl, Br,  $CF_3$ ,  $NO_2$ ,  $NH_2$ ,  $C_1-C_4$  alkyl,  $C_1-C_4$  alkoxy, or methylenedioxy, and in which the amide is substituted with OH,  $C_1-C_4$  alkyl,  $Cl-C_4$  hydroxyalkyl, or a  $C_1-C_4$  hydrocarbon radical. These compositions are described as being useful for treating drug-induced sleepiness, especially sleepiness associated with administration of morphine to cancer patients.

Similarly, U.S. Pat. No. 4,066,686 describes benzhydrylsulfinyl derivatives, including modafinil derivatives with an extended alkyl chain between the sulfinyl and carbonyl groups and where  $NR_3R_4$  is NHOH. These compounds are described as being useful in therapy for treating disturbances of the central nervous system.

PCT publication WO 95/01333 describes modafinil derivatives that are useful for modifying feeding behavior. The modifications to modafinil described include a chloro group at the 3 position of one of the phenyl groups, and a pyridyl substituted for the second phenyl, substitution of one or two methyl groups for hydrogens at the 2-carbon position, the amide hydrogens may be substituted with one or two groups selected from H, a pyridyl-methyl or ethyl groups, and further where the sulfur may not be oxidized.

PCT publication WO 95/01171 also describes modified modafinil compounds that are said to be useful for modifying eating behavior. The described compounds include substitutions of 4-fluoro-, 3-fluoro-, and 4 chloro- in a first phenyl group and 4-fluoro- or 3-fluoro-substitutions in the second phenyl. Also described are substitutions in which the amide contains substitutions with an OH or isopropyl group.

Terauchi, H, et al. described nicotinamide derivatives useful as ATP-ase inhibitors (Terauchi, H, et al, J. Med. Chem., 1997, 40, 313-321). In particular, several N-alkyl substituted 2-(Benzhydrylsulfinyl) nicotinamides are described.

U.S. Pat. Nos. 4,980,372 and 4,935,240 describe benzoylaminophenoxybutanoic acid derivatives. In particular, sulfide derivatives of modafinil containing a phenyl and substituted phenyl linker between the sulfide and carbonyl, and a substituted aryl in the terminal amide position, are disclosed.

Other modafinil derivatives have been disclosed wherein the terminal phenyl groups are constrained by a linking group. For example, in U.S. Pat. No. 5,563,169, certain xanthenyl and thioxanthenyl derivatives having a substituted aryl in the terminal amide position are reported.

3

Other xanthenyl and thioxanthenyl derivatives are disclosed in Annis, I; Barany, G. *Pept. Proc. Am. Pept. Symp. 15<sup>th</sup>* (Meeting Date 1997) 343–344, 1999 (preparation of a xanthenyl derivative of Ellman's Reagent, useful as a reagent in peptide synthesis); Han, Y.; Barany, G. *J. Org. Chem.*, 1997, 62, 3841–3848 (preparation of S-xanthenyl protected cysteine derivatives, useful as a reagent in peptide synthesis); and El-Sakka, I. A., et al. *Arch. Pharm. (Weinheim)*, 1994, 327, 133–135 (thioxanthenol derivatives of thioglycolic acid).

Thus, there is a need for novel classes of compounds that possess beneficial properties. It has been discovered that a class of compounds, referred to herein as substituted thioacetamides, are useful as agents for treating or preventing diseases or disorders, including treatment of sleepiness, promotion of wakefulness, treatment of Parkinson's disease, cerebral ischemia, stroke, sleep apneas, eating disorders, stimulation of appetite and weight gain, treatment of attention deficit hyperactivity disorder, enhancing function in disorders associated with hypofunctionality of the cerebral cortex, including, but not limited to, depression, schizophrenia, fatigue, in particular, fatigue associated with neurologic disease, such as multiple sclerosis, chronic fatigue syndrome, and improvement of cognitive dysfunction. The present invention is directed to these, as well as other, important ends.

#### Definitions

As used herein, the term "alkyl" refers to a substituted or unsubstituted, branched or straight hydrocarbon chain of 1 to 8 carbon atoms, which is formed by the removal of one hydrogen atom. In certain preferred embodiments, the alkyl group contains from 1 to 6 carbon atoms. In other preferred embodiments, the alkyl group contains from 1 to 4 carbon atoms. A designation such as "C<sub>1</sub>-C<sub>4</sub> alkyl" refers to an alkyl radical containing from 1 to 4 carbon atoms. Examples include methyl, ethyl, n-propyl, isopropyl, n-butyl, isobutyl, sec-butyl, t-butyl, pentyl, 2-methylpentyl, hexyl, 2-methylhexyl, 2,3-dimethylhexyl, heptyl, octyl, etc.

As used herein, the term "lower alkyl," refers to a C<sub>1</sub> to C<sub>6</sub> saturated straight chain, branched, or cyclic hydrocarbon,

which are optionally substituted. Lower alkyl groups include, but are not limited to, methyl, ethyl, n-propyl, isopropyl, n-butyl, isobutyl, t-butyl, n-pentyl, cyclopentyl, isopentyl, neopentyl, n-hexyl, isohexyl, cyclohexyl, 3-methylpentyl, 2,2-dimethylbutyl, 2,3-dimethylbutyl and the like.

As used herein, "alkenyl" refers to a substituted or unsubstituted, straight or branched hydrocarbon chain containing from 2 to 8 carbon atoms having one or more carbon-carbon double bonds which may occur in any stable point along the chain, and which is formed by removal of one hydrogen atom. A designation "C<sub>2</sub>-C<sub>8</sub> alkenyl" refers to an alkenyl radical containing from 2 to 8 carbon atoms. Examples include ethenyl, propenyl, isopropenyl, 2,4-pentadienyl, etc.

As used herein, "alkynyl" refers to a substituted or unsubstituted, straight or branched hydrocarbon radical containing from 2 to 8 carbon atoms, having one or more carbon-carbon triple bonds which may occur in any stable point along the chain, and which is formed by removal of one hydrogen atom. A designation "C<sub>2</sub>-C<sub>8</sub> alkynyl" refers to an alkynyl radical containing from 2 to 8 carbon atoms. Examples include ethynyl, propynyl, isopropynyl, 3,5-hexadiynyl, etc.

As used herein, "carbocycle" or "carbocyclic" refer to a substituted or unsubstituted, stable monocyclic or bicyclic hydrocarbon ring which is saturated, partially unsaturated or unsaturated, and contains from 3 to 10 carbon atoms. Accordingly the carbocyclic group may be aromatic or non-aromatic. The bonds connecting the endocyclic carbon atoms of a carbocyclic group may be single, double, triple, or part of a fused aromatic moiety. Carbocycles are intended to include the "cycloalkyl" and "aryl" compounds defined herein.

As used herein, the term "cycloalkyl" refers to a substituted or unsubstituted hydrocarbon ring of 3 to 7 carbon

atoms formed by the removal of one hydrogen atom. A designation such as "C<sub>5</sub>-C<sub>7</sub> cycloalkyl" refers to a cycloalkyl radical containing from 5 to 7 carbon atoms. Examples include cyclopropyl, cyclopentyl, cyclohexyl, cycloheptyl, etc.

As used herein, the terms "heterocycle" or "heterocyclic" refer to a substituted or unsubstituted, saturated, partially unsaturated or unsaturated, stable 3 to 10 membered monocyclic or bicyclic ring wherein at least one member of the ring is a hetero atom. Accordingly the heterocyclic group may be aromatic or non-aromatic. Typically, heteroatoms include, but are not limited to, oxygen, nitrogen, sulfur, selenium, and phosphorus atoms. Preferable heteroatoms are oxygen, nitrogen and sulfur. The nitrogen and sulfur heteroatoms may be optionally oxidized, and the nitrogen may be optionally substituted in non-aromatic rings. The bonds connecting the endocyclic atoms of a heterocyclic group may be single, double, triple, or part of a fused aromatic moiety. Heterocycles are intended to include "heterocyclyl" and "heteroaryl" compounds defined herein.

As used herein, the term "subject" refers to a warm blooded animal such as a mammal, preferably a human, or a human child, which is afflicted with, or has the potential to be afflicted with one or more diseases and conditions described herein.

As used herein, a "therapeutically effective amount" refers to an amount of a compound of the present invention which is effective in reducing, eliminating, treating or controlling the symptoms of the herein-described diseases and conditions. The term "controlling" is intended to refer to all processes wherein there may be a slowing, interrupting, arresting, or stopping of the progression of the diseases and conditions described herein, but does not necessarily indicate a total elimination of all disease and condition symptoms, and is intended to include prophylactic treatment.

As used herein, the term "pharmaceutically acceptable" refers to those compounds, materials, compositions, and/or dosage forms which are, within the scope of sound medical judgment, suitable for contact with the tissues of human beings and animals without excessive toxicity, irritation, allergic response, or other problem complications commensurate with a reasonable benefit/risk ratio.

As used herein, "pharmaceutically acceptable salts" refer to derivatives of the disclosed compounds wherein the parent compound is modified by making acid or base salts thereof. The pharmaceutically acceptable salts include the conventional non-toxic salts or the quaternary ammonium salts of the parent compound formed, for example, from non-toxic inorganic or organic acids. For example, such conventional non-toxic salts include those derived from inorganic acids such as hydrochloric, sulfuric, sulfamic, phosphoric, nitric and the like; and the salts prepared from organic acids such as acetic, propionic, succinic, tartaric, citric, glutamic, benzoic, salicylic, toluenesulfonic, oxalic, and the like.

The pharmaceutically acceptable salts of the present invention can be synthesized from the parent compound which contains a basic or acidic moiety by conventional chemical methods. Generally, such salts can be prepared by reacting the free acid or base forms of these compounds with a stoichiometric amount of the appropriate base or acid in water or in an organic solvent, or in a mixture of the two. Generally, nonaqueous media like ether, ethyl acetate, ethanol, isopropanol, or acetonitrile are preferred. Lists of suitable salts are found in Remington's Pharmaceutical Sciences, 17<sup>th</sup> ed., Mack Publishing Company, Easton, Pa., 1985, p. 1418, the disclosure of which is hereby incorporated by reference.

As used herein, "prodrug" is intended to include any covalently bonded carriers which release the active parent drug according to the compounds of the present invention in vivo when such prodrug is administered to a mammalian subject. Since prodrugs are known to enhance numerous desirable qualities of pharmaceuticals (e.g., solubility, bioavailability, manufacturing, etc.), the compounds of the present invention may be delivered in prodrug form. Thus, the present invention contemplates prodrugs of the claimed compounds, compositions containing the same, and methods of delivering the same. Prodrugs of a compound of the present invention may be prepared by modifying functional groups present in the compound in such a way that the modifications are cleaved, either in routine manipulation or in vivo, to the parent compound. Accordingly, prodrugs include, for example, compounds of the present invention wherein a hydroxy, amino, or carboxy group is bonded to any group that, when the prodrug is administered to a mammalian subject, cleaves to form a free hydroxyl, free amino, or carboxylic acid, respectively. Examples include, but are not limited to, acetate, formate and benzoate derivatives of alcohol and amine functional groups; and alkyl, cycloalkyl, aryl, and alkylaryl esters such as methyl, ethyl, cyclopropyl, phenyl, benzyl, and phenethyl esters, etc.

The present invention provides a method of treating diseases and conditions in a subject in need thereof comprising administering to said subject a therapeutically effective amount of a compound of formula (I), (I-A), (II), or (II-A). For example, the compounds of formula (I), (I-A), (II), or (II-A) can be used in the treatment of sleepiness, preferably sleepiness associated with narcolepsy, promotion of wakefulness, treatment of Parkinson's disease, cerebral ischemia, stroke, sleep apneas, eating disorders, preferably eating disorders associated with a disease, in particular, wherein the disease is anorexia nervosa, stimulation of appetite and weight gain, treatment of attention deficit hyperactivity disorder, enhancing function in disorders associated with hypofunctionality of the cerebral cortex, including, but not limited to, depression, schizophrenia, fatigue, in particular, fatigue associated with neurologic disease, such as multiple sclerosis, chronic fatigue syndrome, and improvement of cognitive dysfunction.

The identification of those subjects who are in need of treatment of herein-described diseases and conditions is well within the ability and knowledge of one skilled in the art. A clinician skilled in the art can readily identify, by the use of clinical tests, physical examination and medical/family history, those subjects who are in need of such treatment.

A therapeutically effective amount can be readily determined by the attending diagnostician, as one skilled in the art, by the use of conventional techniques and by observing results obtained under analogues circumstances. In determining the therapeutically effective amount, a number of factors are considered by the attending diagnostician, including, but not limited to: the species of subject; its size, age, and general health; the specific disease involved; the degree of involvement or the severity of the disease; the response of the individual subject; the particular compound administered; the mode of administration; the bioavailability characteristic of the preparation administered; the dose regimen selected; the use of concomitant medication; and other relevant circumstances.

The amount of a compound of formula (I), (I-A), (II), or (II-A) which is required to achieve the desired biological effect will vary depending upon a number of factors, including the dosage of the drug to be administered, the chemical characteristics (e.g., hydrophobicity) of the compounds employed, the potency of the compounds, the type of disease, the diseased state of the patient, and the route of administration. In general terms, the compounds of this invention may be provided in an aqueous physiological buffer solution containing about 0.1 to 10% w/v compound for parenteral administration. Typical dose ranges are from about 1  $\mu\text{g}/\text{kg}$  to about 1  $\text{g}/\text{kg}$  of body weight per day; a preferred dose range is from about 0.01  $\text{mg}/\text{kg}$  to 100  $\text{mg}/\text{kg}$  of body weight per day. A preferred daily dose for adult humans includes about 25, 50, 100 and 200 mg, and an equivalent dose in a human child. The preferred dosage of drug to be administered is likely to depend on such variables as the type and extent of progression of the disease or disorder, the overall health status of the particular patient, the relative biological efficacy of the compound selected, and formulation of the compound excipient, and its route of administration.

The compounds of the present invention are capable of being administered in unit dose forms, wherein the term "unit dose" means a single dose which is capable of being administered to a patient, and which can be readily handled and packaged, remaining as a physically and chemically stable unit dose comprising either the active compound itself, or as a pharmaceutically acceptable composition, as

described hereinafter. As such, typical daily dose ranges are from about 0.1 to 100  $\text{mg}/\text{kg}$  of body weight. By way of general guidance, unit doses for humans range from about 0.1 mg to about 1000 mg per day. Preferably the unit dose range is from about 1 to about 500 mg administered one to four times a day, and even more preferably from about 10 mg to about 300 mg, two times a day. In an alternate method of describing an effective dose, a preferred oral unit dose is one that is necessary to achieve a blood serum level of about 0.05 to 20  $\mu\text{g}/\text{ml}$ , and more preferably, of about 1 to about 20  $\mu\text{g}/\text{ml}$  in a subject.

Preferred tablets contain lactose, cornstarch, magnesium silicate, croscarmellose sodium, povidone, magnesium stearate, or talc in any combination. It is also an aspect of the present disclosure that a compound of the present invention may be incorporated into a food product or a liquid.

### Synthesis

The compounds of the present invention may be prepared in a number of ways well known to those skilled in the art. The compounds can be synthesized, for example, by the methods described below, or variations thereon as appreciated by the skilled artisan. The appropriate modifications and substitutions being readily apparent and well known or readily obtainable from the scientific literature to those skilled in the art.

It will be appreciated that the compounds of the present invention may contain one or more asymmetrically substituted carbon atoms, and may be isolated in optically active or racemic forms. Thus, all chiral, diastereomeric, racemic forms and all geometric isomeric forms of a structure are intended, unless the specific stereochemistry or isomeric form is specifically indicated. It is well known in the art how to prepare and isolate such optically active forms. For example, mixtures of stereoisomers may be separated by standard techniques including, but not limited to, resolution of racemic forms, normal, reverse-phase, and chiral chromatography, preferential salt formation, recrystallization, and the like, or by chiral synthesis either from chiral starting materials or by deliberate synthesis of target chiral centers.

As will be readily understood, functional groups present on the compounds of the present invention may contain protecting groups during the course of synthesis. For example, the amino acid side chain substituents of the compounds of formula (I), (I-A), (II), or (II-A) can be substituted with protecting groups such as benzyloxycarbonyl or t-butoxycarbonyl groups. Protecting groups are known per se as chemical functional groups that can be selectively appended to and removed from functionalities, such as hydroxyl groups and carboxyl groups. These groups are present in a chemical compound to render such functionality inert to chemical reaction conditions to which the compound is exposed. Any of a variety of protecting groups may be employed with the present invention. Preferred protecting groups include the benzyloxycarbonyl ("Cbz") group, the tert-butyloxycarbonyl ("Boc") group, and the tosyl (p-toluensulfonyl, "Tos") group. Other preferred protecting groups according to the invention may be found in Greene, T. W. and Wuts, P. G. M., *Protective Groups in Organic Synthesis* 2d. Ed., Wiley & Sons, 1991.

Compounds of the present invention may be prepared as outlined in the following schemes. The reagents and starting materials are commercially available, or readily synthesized by well-known techniques by one of ordinary skill in the arts. All substituents, unless otherwise indicated, are as previously defined.

A general synthetic procedure is set forth in Scheme A for preparing the compounds of formula (I) [wherein  $Y=C(R_1)(R_2)$  and  $m, n=0$ ] or (I-A):

Scheme A, step 1: Synthesis of compounds of general structure c:

In step 1a, the appropriate aryl halide a undergoes a metal exchange reaction with an organometallic compound to give the corresponding metalloaryl compound. For example, an appropriate haloaromatic or haloheteroaromatic (compound a) is reacted with an appropriate alkyl lithium compound in an aprotic solvent at a temperature  $-78^{\circ}\text{C}$ . An appropriate haloaromatic or haloheteroaromatic compound is one where  $\text{Ar}_1$  is as defined in the final product. An appropriate alkyl lithium compound is one that effects a metal-halogen exchange.

In step 1b, an appropriate aryl aldehyde b is added to the previously formed metalloaryl compound to give desired di-aryl alcohol c. For example, an appropriate aromatic aldehyde or heteroaromatic aldehyde (compound b) in an aprotic solvent is added to reaction product of step 1a. An appropriate heteroaromatic aldehyde is one where  $\text{Ar}_2$  is as defined in the final product. Upon completion, the reaction mixture is quenched by an appropriate quenching agent and the product, compound c, is isolated by conventional methods commonly employed by those skilled in the art.

For example, a cooled ( $-70^{\circ}\text{C}$ . to  $-78^{\circ}\text{C}$ .) solution of an appropriate haloaromatic or haloheteroaromatic (compound a) in dry ether is reacted with *n*-butyllithium (1.1 eqv). After stirring for an additional period of time to allow the completion of halogen-metal exchange reaction, the next reactant, an appropriate heteroaromatic aldehyde (compound b) in ether is slowly be added to the reaction flask. Stirring is continued for an additional 2–3 h at the low temperature. The cooling bath is removed and the reaction mixture is slowly allowed to come to ambient temperature, followed by quenching, preferably by a saturated  $\text{NH}_4\text{Cl}$  solution. The mixture is extracted into an organic solvent (ether or ethyl acetate). The organic layer is washed with brine, dried ( $\text{MgSO}_4$  or  $\text{Na}_2\text{SO}_4$ ) and concentrated to give a crude product. Purification is achieved by employing known purification techniques (preferably by column chromatography

and/or recrystallization) to provide pure compounds C. The method is an adaptation from a procedure previously described by Gronowitz, S.; Eriksson, B. *Arkiv Kemi* 1963, 335, incorporated herein by reference in its entirety. Alternatively, this class of compounds wherein  $\text{Ar}_1$  is the same as  $\text{Ar}_2$  may be generated by treatment of two equivalents of an appropriate haloheteroaromatic with two equivalents of *n*-butyllithium, followed by one equivalent of ethyl formate as described by Nenajdenko, V. G.; Baraznenok, I. L.; Balenkova, E. S. *J. Org. Chem.* 1998, 6132, incorporated herein by reference in its entirety.

Scheme A, step 2: Synthesis of compounds of general structure d:

In step 2a, the alcohol moiety of compound c is converted to the corresponding thiol. The thiol, in step 2b, undergoes a substitution reaction with an appropriate halogen-substituted alkylcarboxylic acid of structure  $\text{Br}-(\text{CH}_2)_m-\text{Y}-(\text{CH}_2)_n-\text{COOH}$ , to generate compound d. For example, di-aryl alcohol c is reacted with thiourea in presence of an acid to convert it to a thiuronium moiety that is subsequently hydrolyzed in the presence of an alkaline base and reacted with the appropriate halogen-substituted alkylcarboxylic acid to generate compound d (step 2b). An appropriate acid derivative is one in which *m*, *n*, *Y* are as defined in the final product.

For example, in step 2a, an appropriate amount of thiourea is taken into 48% HBr and water. The mixture is warmed (preferably to  $60-70^{\circ}\text{C}$ .), followed by addition of compound c. The temperature of the reaction mixture is elevated (preferably to  $90-95^{\circ}\text{C}$ .) and the stirring is continued for an additional period of time for completion of the reaction. The reaction mixture is cooled to room temperature (in some cases, an ice-bath might be needed) and the precipitated solid should be filtered and thoroughly washed with water.

In step 2b, the wet solid from the previous step is taken into additional water and treated with an aqueous base, preferably sodium hydroxide solution. The mixture is

39

warmed (preferably to 70–80° C., but in some cases a higher temperature might be needed) and to it an appropriate amount of halogen-substituted alkylcarboxylic acid derivative in water (or in some cases, an alcoholic solvent) is added. The reaction mixture is maintained at an elevated temperature (preferably 100–110° C.) for an appropriate period of time, cooled, taken into water and washed with an organic solvent (preferably ether). The basic aqueous layer is acidified with an inorganic acid solution (e.g. aqueous HCl solution). The aqueous (acidic) solution is then extracted several times into an organic solvent (e.g. ether or ethyl acetate). The combined organic layer is washed with brine, dried (MgSO<sub>4</sub> or Na<sub>2</sub>SO<sub>4</sub>) and concentrated to give the crude product that may be used directly in the next step. However, purification could be achieved by employing known purification techniques (e.g. recrystallization) to provide pure compound d.

The method is an adaptation from a procedure previously described in U.S. Pat. No. 4,177,290, incorporated by reference herein in its entirety.

Scheme A, step 3: Synthesis of compounds of general structure e:

In step 3a, the carboxylic acid is converted into appropriate acid derivative, which is then reacted with an appropriate amine to give compound e. For example in step 3a, compound d can be converted to the corresponding acid chloride, or the corresponding activated ester. The acid chloride can be obtained by reacting compound d with thionyl chloride in an aromatic hydrocarbon solvent in refluxing condition. Alternatively, the activated ester can be obtained by use of various agents known in the art, such as 2-(1H-Benzotriazol-1-yl)-1,1,3,3-tetramethyluronium tetrafluoroborate ("TBTU"), N-methylmorpholine ("NMM") and dimethyl formamide ("DMF"). In step 3b, the product of step 3a is reacted with an appropriate amine of structure NHR<sub>3</sub>R<sub>4</sub> to give the desired compound e. An appropriate amine is one which correlates to R<sub>3</sub> and R<sub>4</sub> as defined in the final product.

For example, a solution of an appropriate carboxylic acid (compound d) in either benzene or toluene is brought to reflux temperature and to it is slowly added an appropriate amount of thionyl chloride. The mixture is refluxed until the disappearance of starting material (as evidenced by analytical techniques), cooled and solvent removed. The resulting residue is taken into an appropriate organic solvent (preferably tetrahydrofuran or methylene chloride) and treated with ammonia gas (or 28% aqueous ammonia hydroxide solution) or an appropriate amine. The reaction mixture is then partitioned between water and an organic solvent (preferably ethyl acetate). The separated organic layer is washed with water, dilute acid, dilute base and brine, dried over a drying agent (e.g. MgSO<sub>4</sub> or Na<sub>2</sub>SO<sub>4</sub>) and concentrated to give the crude product that may be purified by column chromatography and/or recrystallization to produce compound e.

Scheme A, optional step 4: Synthesis of compounds of general structure f:

Compounds of structure e may optionally be oxidized to generate compounds of structure f. Thus, compound f is prepared by reacting compound e in an appropriate solvent with an appropriate oxidizing agent. An appropriate oxidizing agent is one that oxidizes the sulfide group of compound e. The corresponding product is isolated and purified by methods well known in the art.

For example, to a cooled (–15° C. to –25° C.) solution of compound e in an organic solvent (preferably methylene chloride or chloroform), an appropriate oxidizing agent (e.g.

40

m-chloroperoxybenzoic acid ["m-CPBA"], 1 equivalent) in the same solvent is slowly added. Stirring is continued at low temperature until the disappearance of the starting material, as evidenced by various analytical techniques. The reaction mixture is then thoroughly washed with a saturated sodium bicarbonate solution, water and brine, respectively, dried over a drying agent (e.g. MgSO<sub>4</sub> or Na<sub>2</sub>SO<sub>4</sub>) and concentrated. The desired product (compound f) is purified, if needed, by employing known purification techniques (preferably by column chromatography and/or recrystallization). In some cases, the oxidation is performed by employing 50% H<sub>2</sub>O<sub>2</sub> in glacial acetic acid solvent.

Scheme C, step 4: Synthesis of compounds of general structure ggg.

The thioamide moiety in compound fff is cyclized to the corresponding thiazole moiety. For example, a mixture of compound fff and an appropriate bromomethyl ketone (1.1 eqv) in a suitable solvent (e.g. ethanol) is heated to reflux until the disappearance of the starting material. After cooling, the desired product (compound ggg) is obtained by employing known purification techniques (preferably by column chromatography and/or recrystallization).

In the second step, the thioether formed in the first step is optionally oxidized with an appropriate oxidizing agent to provide compound 60. An appropriate oxidizing agent is one that oxidizes the thioether to its corresponding sulfoxide or sulfone.

A synthetic procedure is set forth in Reaction Scheme F for preparing compounds of formula (II-A), wherein  $R_1$  or  $R_2$  can be taken together with either  $R_3$  or  $R_4$  to form a 3-7 member heterocyclic ring. A similar procedure may be utilized to prepare the corresponding compounds of formula (II-A). The subsequently formed ring is represented in Scheme E by "G". In the present scheme,  $R_1$  is taken together with  $R_3$  to form heterocyclic ring "G". and stirring was continued for an additional period of time for completion of the reaction. The reaction mixture was then cooled to room temperature (in some cases, an ice-bath might be needed) and the precipitated solid was filtered and thoroughly washed with water.

The wet solid was then taken into additional water and treated with an aqueous base, preferably sodium hydroxide solution. The mixture was warmed (preferably to 70°–80° C., but in some cases, a higher temperature might be needed) and to it chloroacetic acid (4.8 g, 1.1 equivalents) in water was added. The reaction mixture was maintained at an elevated temperature (preferably 100°–110° C.) for an appropriate period of time, cooled, taken into water and washed with an organic solvent (preferably ether). The basic aqueous layer was acidified with an inorganic acid solution (e.g. aqueous HCl solution). The aqueous (acidic) solution was then extracted several times into an organic solvent (e.g. ether or ethyl acetate). The combined organic layer was washed with brine, dried (MgSO<sub>4</sub> or Na<sub>2</sub>SO<sub>4</sub>) and concentrated to give the crude product 34 that may be used directly in the next step. However, purification may also be achieved by employing known purification techniques (e.g. recrystallization) to provide pure compound 34; <sup>1</sup>H—NMR (CDCl<sub>3</sub>) δ7.30 (d, 2H), 7.20 (s, 2H), 7.10 (d, 2H), 5.40 (s, 1H), 3.10 (s, 2H).

The method is an adaptation from a procedure previously described in U.S. Pat. No. 4,177,290 (issued on Dec. 4, 1979) that is incorporated by reference herein in its entirety.

## Preparation of Compound 35

Scheme 3, step 3: A solution of the thioacid 34 (9.0 g) in benzene was brought to reflux temperature and to it was slowly added 1.1 equivalents of thionyl chloride. The mixture was refluxed until the disappearance of the starting material (as evidenced by analytical techniques), cooled and the solvent removed to give the crude product 35 that may be used directly in the next step. However, purification may also be achieved by employing known purification techniques (e.g. recrystallization) to provide pure compound 35.

Animal Surgery. Adult, male Wistar rats (275–320g from Charles River Laboratories, Wilmington, Mass.) were anesthetized (Nembutal, 60 mg/kg, ip) and surgically prepared with implants for recording of chronic EEG and EMG recording. The EEG implants consisted of stainless steel screws (2 frontal (+3.9 AP from bregma,  $\pm$ 2.0 ML) and 3 occipital (–6.4 AP,  $\pm$ 5.5 ML). Two Teflon-coated stainless steel wires were positioned under the nuchal trapezoid muscles for EMG recording. All leads were soldered to a miniature connector (Microtech, Boothwyn, Pa.) and gas sterilized with ethylene oxide before surgery. The implant assembly was affixed to the skull by the combined adhesion of the EEG recording screws, cyanoacrylate applied between the hermetically sealed implant connector and skull and dental acrylic. An antibiotic (Gentamycin) was administered for 3 to 5 days postsurgery. At least 3 weeks were allowed for postsurgical recovery.

Recording environment. Rats were housed individually within specially modified Nalgene microisolator cages equipped with a low-torque slip-ring commutator (Biella Engineering, Irvine, Calif.) and a custom polycarbonate filter-top rise. These cages were isolated in separate, ventilated compartments of a stainless steel sleep-wake recording chamber. Food and water were available ad libitum and ambient temperature was  $24\pm 1^\circ\text{C}$ . A 24-h light-dark cycle (light/dark 12-12-) was maintained throughout the study by 4-watt fluorescent bulbs located approximately 5 cm from the top of each cage. Light intensity was 30 to 35 lux at midlevel inside the cage. Animals were undisturbed for 3 days both before and after the treatments.

Automated data collection. Sleep and wake stages were determined with SCORE, a microcomputer-based sleep-wake and physiological monitoring system. SCORE™ design features, validation in rodents and utility in preclinical drug evaluation have been reported elsewhere (Van Gelder, et al., 1991; Edgar, et al., 1991, 1997; Seidel, et al., 1995, incorporated by reference herein in their entirety). In the present study, the system monitored amplified ( $\times$ 10,000) EEG (bandpass, 1–30 Hz; digitization rate, 100 Hz) and integrated EMG (bandpass, 10–100 Hz, root mean square integration). Arousal states were classified on-line as NREM sleep, REM sleep, wake or theta-dominated wake every 10 s by use of EEG period and amplitude feature extraction and ranked membership, algorithm. Individually taught EEG-arousal-state templates and EMG criteria differentiated REM sleep from theta-dominated wakefulness (Welsh, et al., 1985, incorporated by reference herein in its entirety). Data quality was assured by frequent on-line inspection of the EEG and EMG signals. Raw data quality and sleep-wake scoring was scrutinized further by a combination of graphical and statistical assessments of the data as well as visual examination of the raw EEG wave forms and distribution of integrated EMG values.

Drug administration and study design. Compound I-9 was suspended in sterile 0.25% methylcellulose (pH=6.2; Upjohn Co., Kalamazoo, Mich.) or methylcellulose vehicle alone was injected intraperitoneally in a volume of 1 ml/kg. Sample size (n) was 13 animals per treatment group.

EEG spectral analysis. Each 10-s epoch of raw EEG signal was digitized (100 Hz) for 24 h and wakefulness was scored as described previously by Edgar and Seidel (1996), incorporated by reference herein in its entirety.

Data analysis and statistics. The principal variable recorded was minutes per hour of wake. Treatment groups were compared post-treatment by repeated-measures ANOVA. In the presence of a significant main effect, Dun-

nett's contracts ( $\alpha=0.05$ ) assessed differences between active treatment groups and vehicle controls, unless otherwise specified.

Results. FIG. 1 illustrates degree of wakefulness in rats treated at time zero with either 100 mg/kg, ip of compound I-9 (solid line) or methylcellulose vehicle (stippled line). Compound I-9 produced wakefulness beyond that observed in vehicle-treated animals that lasted until approximately 10 minutes following administration.

#### EXAMPLE 94

##### Demonstration of Wake-Promoting Activity of Compound II-23

The methodology utilized is based on that described by Edgar and Seidel, *Journal of Pharmacology and Experimental Therapeutics*, 283:757-769, 1997, and incorporated herein in its entirety by reference.

**Animal Surgery.** Adult, male Wistar rats (275-320 g from Charles River Laboratories, Wilmington, Mass.) were anesthetized (Nembutal, 45 mg/kg, ip) and surgically prepared with implants for recording of chronic EEG and EMG recording. The EEG implants were made from commercially available components (Plastics One, Roanoke, Va.) EEG's were recorded from stainless steel screw electrodes (2 frontal (+3.0 mm AP from bregma,  $\pm 2.0$  mm ML) and 2 occipital (-4.0 mm AP,  $\pm 2.0$  mm ML)). Two Teflon-coated stainless steel wires were positioned under the nuchal trapezoid muscles for EMG recording. All electrode leads were inserted into a connector pedestal and the pedestal, screws, and wires affixed to the skull by application dental acrylic. Antibiotic was administered post surgically and antibiotic cream was applied to the wound edges to prevent infection. At least 1 week elapsed between surgery and recording. Animals are tested for approximately 6-8 weeks and then sacrificed.

**Recording environment.** Postsurgically, rats were housed individually in an isolated room. At least 24 hrs. prior to recording, they were placed in Nalgene containers (31x31x31 cm) with a wire-mesh top, and entry to the room was prohibited until after recording had ended except for dosing. The containers were placed on a 2-shelf rack, 4 per shelf. Food and water were available ad libitum, ambient temperature was 21° C., and humidity was 55%. White-noise was provided in the background (68 db inside the containers) to mask ambient sounds. Fluorescent overhead room lights were set to a 24 hr. light/dark cycle (on at 7 AM, off at 7 PM). Light levels inside the containers were 38 and 25 lux for the top and bottom shelves respectively.

**Data acquisition.** EEG and EMG signals were led via cables to a commutator (Plastics One) and then to preamplifiers (model 1700, A-M Systems, Carlsborg, Wash.). EEG and EMG signals were amplified (10K and 1K respectively) and bandpass filtered between 0.3 and 500 Hz for EEG, and between 10 and 500 Hz for EMG. These signals were digitized at 128 samples per second using ICELUS sleep research software (M. Opp, U. Texas; see Opp, *Physiology and Behavior* 63:67-74, 1998, and Imeri, Mancina, and Opp, *Neuroscience* 92:745-749, 1999, incorporated by reference herein in their entirety) running under Labview 5.1 software and data acquisition hardware (PCI-MIO-16E-4; National Instruments, Austin, Tex.). On the day of dosing, data was recorded from 11 AM to 6 PM.

**Sleep/wake scoring.** Sleep and wake stages were determined manually using ICELUS software. This program displays the EEG and EMG data in blocks of 6 sec. along

with the EEG-FFT. Arousal state was scored as awake (WAK), rapid eye-movement (REM), or slow-wave or non-REM sleep (NREM) according to visual analysis of EEG frequency and amplitude characteristics and EMG activity (Opp and Krueger, *American Journal of Physiology* 266:R688-95, 1994; Van Gelder, et al., 1991; Edgar, et al., 1991, 1997; Seidel, et al, 1995, incorporated by reference herein in their entirety). Essentially, waking activity consists of relative low-amplitude EEG activity with relatively lower power in the lower frequency bands from 0.5-6 Hz, accompanied by moderate to high level EMG activity. In a particular waking state ("theta-waking"), EEG power can be relatively focused in the 6-9 Hz (theta) range, but significant EMG activity is always present. NREM sleep is characterized by relative high-amplitude EEG activity with relatively greater power in the low frequency bands from 0.5-6 Hz, accompanied by little or no EMG activity. REM sleep is characterized by moderate and constant amplitude EEG focused in the theta (6-9 Hz range), similar to waking theta, but with no EMG activity.

**Drug administration and study design.** Compounds were evaluated on groups of 4 or 8 rats which were tested in 2 sessions at least 2 days apart. Initial studies used a crossover design, such that rats received either vehicle or test compound during each session. Animals were pseudo-randomized so that they did not receive the same drug twice. Compound II-23 was suspended in sterile 0.25% methylcellulose (pH=6.2; Upjohn Co., Kalamazoo, Mich.) at 30 mg/ml. This study was carried out on 8 rats which were tested in 2 sessions 5 days apart (overall, 7 rats received compound II-23 and 6 methylcellulose vehicle). Dosing was carried out at noon, while the rats were predominantly asleep. Each rat was lifted out of its container, given an intraperitoneal injection in a volume of 3.33 ml/kg, and replaced. Dosing required approximately 8 minutes.

**Data analysis and statistics.** The principal outcome measure was minutes per hour of wakefulness. The primary outcome measure for purposes of determining activity in these experiments consists of the total integrated wake time for the first 3 hours post dosing relative to vehicle control. Thus, vehicle treated animals typically average 20% wake time during the recording period, or a total of  $0.2 * 180 = 36$  min. A 2-tailed, unpaired t-test (Statview 5.0, SAS Institute, Inc., Cary, N.C.) was performed on the wake time values for drug and vehicle treated animals, and compounds with  $p < 0.05$  were deemed significantly wake-promoting. Waking activity was also evaluated for successive half-hour periods beginning with the time of dosing, and individual t-tests performed at each time point to establish the duration of significant wake-promoting activity.

Results. FIG. 2 illustrates degree of wakefulness in rats treated at noon with either 100 mg/kg, ip. of compound II-23 (solid triangles) or methylcellulose vehicle (open circles). Each point represents the mean percent of time awake for the succeeding half hour. The dosing procedure produced a transient (~20 min.) period of elevated wakefulness in both treatment groups compared to pre-dosing baseline activity. Compound II-23 produced significantly greater wakefulness than that observed in vehicle-treated animals ( $p < 0.05$ ).
