Matter enclosed in heavy brackets [] appears in the original patent but forms no part of this reissue specification; matter printed in italics indicates the additions made by reissue.

This Application is a continuation of U.S. patent application Ser. No. 10/089,964, filed May 8, 2002, *now U.S. Pat. The compounds of the invention are antagonists of tachykinins, including substance P and other neurokinins, both in vitro and in vivo and are thus of use in the treatment

of conditions mediated by tachykinins, including substance P and other neurokinins.

NK₁-receptor binding affinity has been determined in vitro by the compounds' ability to displace [3H]-substance P (SP) from recombinant human NK₁ receptors expressed in Chinese Hamster Ovary (CHO) cell membranes.

CHO cell membranes were prepared by using a modification of the method described by Dam T and Quirion R (Peptides, 7:855-864, 1986). Thus ligand binding was performed in 0.4 ml of 50 mM HEPES, pH 7.4, containing 3 mM MnCl₂, 0.02% BSA, 0.5 nM [³H]Substance P (30+56 Ci/mmol, Amersham), a final membrane concentration of 25 µg of protein/ml, and the test compounds. The incubation proceeded at room temperature for 40 min. Non-specific binding was determined using excess of Substance P (1 µM) and represents about 6% of the total binding.

Compounds of the invention were further characterised in a functional assay for the determination of their inhibitory effect. Human-NK₁-CHO cells were stimulated with Substance P and the receptor activation was evaluated by measuring the accumulation of cytidinediphosphodiacylglycerol (CDP-DAG), which is the liponucleotide precursor of phosphatidylinositol diphosphate. CDP-DAG accumulates in the presence of Li⁺ as a consequence of the receptor mediated activation of phospholipase C (PLC) (Godfrey, Biochem. J., 258:621-624, 1989). The method is described in detail by Ferraguti et al. (Mol. Cell. Neurosci., 5:269-276, 1994).

The action of the compounds of the invention at the NK₁ receptor may be determined by using conventional tests. Thus the ability to bind at the NK₁ receptor was determined using the gerbil foot tapping model as described by Rupniak & Williams, Eur. J. of Pharmacol., 1994.

Compounds of the invention have also been found to exhibit anxiolytic activity in conventional tests. For example in marmoset human threat test (Costall et al., 1988).

Compounds of the invention may be useful in the treatment of CNS disorders in particular in the treatment or prevention of major depressive disorders including bipolar depression, unipolar depression, single or recurrent major depressive episodes with or without psychotic features, catatonic features, melancholic features, atypical features or postpartum onset, the treatment of anxiety and the treatment of panic disorders. Other mood disorders encompassed within the term major depressive disorders include dysthymic disorder with early or late onset and with or without atypical features, neurotic depression, post traumatic stress disorders and social phobia; dementia of the Alzheimer's type, with early or late onset, with depressed mood; vascular dementia with depressed mood; mood disorders induced by alcohol, amphetamines, cocaine, hallucinogens, inhalants, opioids, phencyclidine, sedatives, hypnotics, anxiolytics and other substances; schizoaffective disorder of the depressed type; and adjustment disorder with depressed mood. Major depressive disorders may also result from a general medical condition including, but not limited to, myocardial infarction, diabetes, miscarriage or abortion, etc.

Compounds of the invention are useful as analgesics. In particular they are useful in the treatment of traumatic pain such as postoperative pain; traumatic avulsion pain such as brachial plexus; chronic pain such as arthritic pain such as occurring in osteo-, rheumatoid or psoriatic arthritis; neuropathic pain such as post-herpetic neuralgia, trigeminal neuralgia, segmental or intercostal neuralgia, fibromyalgia, causalgia, peripheral neuropathy, diabetic neuropathy, chemotherapy-induced neuropathy, AIDS related neuropathy, occipital neuralgia, geniculate neuralgia, glos-

sopharyngeal neuralgia, reflex sympathetic dystrophy, phantom limb pain; various forms of headache such as migraine, acute or chronic tension headache, temporomandibular pain, maxillary sinus pain, cluster headache; odontalgia; cancer pain; pain of visceral origin; gastrointestinal pain; nerve entrapment pain; sport's injury pain; dysmenorrhoea; menstrual pain; meningitis; arachnoiditis; musculoskeletal pain; low back pain e.g. spinal stenosis; prolapsed disc; sciatica; angina; ankylosing spondylitis; gout; burns; scar pain; itch; and thalamic pain such as post stroke thalamic pain.

Compounds of the invention are also useful in the treatment of sleep disorders including dysomnia, insomnia, sleep apnea, narcolepsy, and circadian rhythmic disorders.

Compounds of the invention are also useful in the treatment or prevention of the cognitive disorders. Cognitive disorders include dementia, amnesic disorders and cognitive disorders not otherwise specified.

Furthermore compounds of the invention are also useful as memory and/or cognition enhancers in healthy humans with no cognitive and/or memory deficit.

Compounds of the invention are also useful in the treatment of tolerance to and dependence on a number of substances. There is also provided as a further aspect of the invention the use of a compound of formula (I) or a pharmaceutically acceptable salt or solvate thereof in the preparation of a

medicament for use in the treatment of conditions mediated by tachykinins, including substance P and other neurokinins.

In an alternative or further aspect there is provided a method for the treatment of a mammal, including man, in particular in the treatment of conditions mediated by tachykinins, including substance P and other neurokinins, comprising administration of an effective amount of a compound of formula (I) or a pharmaceutically acceptable salt thereof.

It will be appreciated that reference to treatment is intended to include prophylaxis as well as the alleviation of established symptoms. Compounds of formula (I) may be administered as the raw chemical but the active ingredient is preferably presented as a pharmaceutical formulation.

Accordingly, the invention also provides a pharmaceutical composition which comprises at least one compound of formula (I) or a pharmaceutically acceptable salt thereof and formulated for administration by any convenient route. Such compositions are preferably in a form adapted for use in medicine, in particular human medicine, and can conveniently be formulated in a conventional manner using one or more pharmaceutically acceptable carriers or excipients.

Thus compounds of formula (I) may be formulated for oral, buccal, parenteral, topical (including ophthalmic and nasal), depot or rectal administration or in a form suitable for administration by inhalation or insufflation (either through the mouth or nose).

For oral administration, the pharmaceutical compositions may take the form of, for example, tablets or capsules prepared by conventional means with pharmaceutically acceptable excipients such as binding agents (e.g. pregelatinised maize starch, polyvinylpyrrolidone or hydroxypropyl methylcellulose); fillers (e.g. lactose, microcrystalline cellulose or calcium hydrogen phosphate); lubricants (e.g. magnesium stearate, talc or silica); disintegrants (e.g. potato starch or sodium starch glycollate); or wetting agents (e.g. sodium lauryl sulphate). The tablets may be coated by methods well known in the art. Liquid preparations for oral administration may take the form of, for example, solutions, syrups or suspensions, or they may be presented as a dry product for constitution with water or other suitable vehicle before use. Such liquid preparations may be prepared by conventional means with pharmaceutically acceptable additives such as suspending agents (e.g. sorbitol syrup, cellulose derivatives or hydrogenated edible fats); emulsifying agents (e.g. lecithin or acacia); non-aqueous vehicles (e.g. almond oil, oily esters, ethyl alcohol or fractionated vegetable oils); and preservatives (e.g. methyl or propyl-p-hydroxybenzoates or sorbic acid). Protection and deprotection may be effected using conventional techniques such as those described in "Protective Groups in Organic Synthesis 2nd Ed." by T. W. Greene and P. G. M. Wuts (John Wiley and Sons, 1991) and as described in the examples hereinafter.

Compounds of formula (I) wherein R₄ is a CO(CH₂)_pR₇ group or protective derivatives thereof may be also prepared by reaction of the compound of formula (I)

65

15

(I)

wherein R_4 is a hydrogen atom, with an activated derivative of the acid $R_7(\text{CH}_2)_p\text{CO}_2\text{H}$ (IX).

The activated derivatives of the carboxylic acid (IX) may be prepared by conventional means. Suitable activated derivatives of the carboxylic group include the corresponding acyl halide, mixed anhydride, activated ester such as thioester or the derivative formed between the carboxylic acid group and a coupling agent such as that used in peptide chemistry, for example, carbonyl diimidazole or a diimide such as 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide. The reaction is preferably carried out in an aprotic solvent such as an amide e.g. N,N-dimethylformamide or acetonitrile.

Compounds of formula (I) wherein R_4 is CONR_9R_8 in which R_9 or R_8 have the meaning defined in formula (I) may be prepared by reaction of a compound of formula (I) wherein R_4 is a hydrogen atom with triphosgene in an aprotic solvent such as dichloromethane and in the presence of an organic base such as triethylamine followed by reaction with the amine compound NR_9R_8 (X).

Alternatively compounds of formula (I) wherein R_4 is a CONHR_9 group in which R_9 is C_{1-4} alkyl may be also prepared by reaction with isocyanate of formula $\text{R}_9\text{NC}=\text{O}$ (XI). The reaction with the compound (XI) is conveniently carried out in a solvent such as tetrahydrofuran or aqueous tetrahydrofuran, a halohydrocarbon (e.g. dichloromethane) or acetonitrile optionally in the presence of a base such as triethylamine and at temperature within the range $0-80^\circ\text{C}$.

In a further embodiment compounds of formula (I) wherein R_4 is $(\text{CH}_2)_q\text{R}_7$ or R_4 is $(\text{CH}_2)_r\text{CO}(\text{CH}_2)_p\text{R}_7$ wherein q , r and R_7 have the meanings defined in formula (I) or are protective derivatives thereof with the provision that r is not zero, may also be prepared by reaction of compounds of formula (I) wherein R_4 is a hydrogen group with a compound of formula (XII) $\text{R}_7(\text{CH}_2)_q\text{X}$ or $\text{X}(\text{CH}_2)_r\text{CO}(\text{CH}_2)_p\text{R}_7$ (XIII), in which X is a leaving group such as halogen e.g. chlorine, a bromine atom, a mesyl or a tosyl group.

In a further preferred embodiment compounds of formula (I) wherein R_4 is $(\text{CH}_2)_q\text{R}_7$ wherein q and R_7 have the meanings defined in formula (I) or are protective derivatives thereof may be also prepared by reaction of compounds of formula (I) wherein R_4 is a hydrogen group with a compound of formula (XIV) $\text{R}_7(\text{CH}_2)_q\text{CHO}$ (XIV), in which q is zero or an integer from 1 to 3 and R_7 has the meanings defined in formula (I) or are protective derivatives thereof, in the presence of suitable metal reducing agent such as NaCNBH_3 .

In a further preferred embodiment compounds of formula (I) wherein R_1 and R_2 together with nitrogen and carbon atom to which they are attached respectively represent a 5 to 6 unsaturated membered heterocyclic group may be prepared by ring closing metathesis reaction (RCM) of compounds of formula (XV).

16

(XV)

15 catalysed by a transition metal complex such as a ruthenium alkylidene complex (i.e. benzylidene bis(tricyclohexylphosphine)dichlororuthenium). The reaction is conveniently carried out in an aprotic solvent such dichloromethane at 0°C .

20 Compounds of formula (XV) may be prepared from the appropriate intermediate using any of the processes described herein for preparing compounds of formula (I).

Compound of formula (I) wherein R_1 and R_2 together with nitrogen and carbon atom to which they are attached respectively represent a 5 to 6 saturated membered heterocyclic group may be prepared by reduction of the corresponding 5 to 6 unsaturated membered heterocyclic group with suitable reducing agent such as catalytic hydrogenation in a suitable solvent such as methanol at room temperature.

Where it is desired to isolate a compound of formula (I) as a salt, for example a pharmaceutically acceptable salt, this may be achieved by reacting the compound of formula (I) in the form of the free base with an appropriate amount of suitable acid and in a suitable solvent such as an alcohol (e.g. ethanol or methanol), an ester (e.g. ethyl acetate) or an ether (e.g. diethyl ether tertbutylmethyl ether or tetrahydrofuran).

35 Compounds of formula (V), (VI), (VIII), (IX), (X) (XII), (XIII) or (XIV) may be prepared by analogous methods to those used for known compounds.

Thus for example compounds of formula (VIII) may be obtained by reduction of a compound of formula (III).

The reaction may be carried out using a suitable metal reducing agent such as a metal hydride, for example a borane hydride, or a metal hydride complex like lithium aluminum hydride, borohydride, or an organo-metallic complex such as borane-methyl sulphide, 9-borabicyclononane (9-BBN), triethylsilane, sodium triacetoxyborohydride, sodium cyanoborohydride.

Alternatively boranes may be produced in situ by reacting Sodium Borohydride in the presence of Iodine, an inorganic acid (e.g. sulphuric) or an organic acid such as formic acid, trifluoroacetic, acetic acid, methansuphonic acid.

Pharmaceutically acceptable salts may also be prepared from other salts, including other pharmaceutically acceptable salts, of the compound of formula (I) using conventional methods.

The compounds of formula (I) may readily be isolated in association with solvent molecules by crystallisation from or evaporation of an appropriate solvent to give the corresponding solvates.

When a specific enantiomer of a compound of general formula (I) is required, this may be obtained for example by resolution of a corresponding enantiomeric mixture of a compound of formula (I) using conventional methods.

Thus specific enantiomers of the compounds of formula (I) in which R_4 is a hydrogen atom may be prepared by reaction of a suitable chiral alcohol, in the presence of a source of a carbonyl group (such as triphosgene or carbonyl

17

diimidazole) separating the resulting diastereoisomeric carbamates by conventional means e.g. chromatography or by fractional crystallisation. The required enantiomer of a compound of general formula (I) may be isolated by removal of carbamate and conversion into the required free base or salts thereof.

Suitable chiral alcohol for use in the process include (R)-sec-phenylethyl alcohol, etc.

Alternatively, enantiomers of a compound of general formula (I) may be synthesised from the appropriate optically active intermediates using any of the general processes described herein.

Thus for example the required enantiomer may be prepared by the corresponding enantiomeric amine of formula (III) using any of the processes described above for preparing compounds of formula (I) from the amine (III). The enantiomer of amine (III) may be prepared from the racemic amine (III) using conventional procedures such as salt formation with a suitable optically active acid such as L(+)-mandelic acid or (1S)-(+)-10-camphorsulfonic acid.

In one preferred embodiment of the invention the specific enantiomer of amine (IIIa)

may be prepared by dynamic kinetic resolution of amine(III) with a suitable optically active acid such as L(+)-mandelic acid or (1S)-(+)-10-camphorsulfonic acid in the presence of aromatic aldehyde such as 3,5 dichlorosalicylaldehyde, salicylaldehyde, benzaldehyde-p-nitro benzaldehyde.

A particular preferred aldehyde for use in this reaction is 3,5 dichlorosalicylaldehyde. The reaction is conveniently carried out in an aprotic solvent such as tetrahydrofuran, ethyl acetate at a temperature ranging between 20–60° C.

1) To a suspension of magnesium turnings (139 mg) in anh. THF (2.6 mL), at r.t., under N₂, a small crystal of I₂ was added, followed by 10% of a solution of commercial 1-bromo-2,4difluoro-benzene (1.0 g) in anh. THF (2.6 mL). The suspension was heated gently (heat gun) until the brown colour disappeared. The remaining bromide was added drop-wise, maintaining the reaction mixture warm (50–60° C.) with an oil bath. After the addition was complete (15 min) the suspension was stirred at 60° C. until the magne-

20

sium turnings had almost completely reacted (2 hr). The new brown solution was used in the next step.

2) To a solution of the 2-chloropyrazine (463 μ L) in anh. THF (5.2 mL), at 0° C., under N₂, [1,2-bis(diphenylphosphino)ethane]dichloronickel(II) (50 mg) and the Grignard solution were successively added drop-wise. The brown solution was stirred at r.t. for 30 min, then at reflux for 3 hr. It was then poured in sat.aq. NaCl/DCM and the phases were separated. The aqueous layer was extracted with DCM (2 \times) and the combined organic extracts were dried. The solids were filtered and the solvent evaporated. The crude oil obtained was purified by flash chromatography (CH/AcOEt 7:3) to give the title compound as a yellow solid (175 mg).

A two neck round bottom flask was equipped with a water condenser and a dropping funnel and was flushed with N₂. Mg turnings (1.45 g) were introduced in the flask and were suspended in anh. THF (5 mL). A small crystal of I₂ was added in order to activate the Mg. The dropping funnel was filled with a solution of the commercial 2-bromo-5-fluorotoluene (10 g) in anh. THF (30 mL). The solution of the bromide was added drop-wise to the Mg turnings and the solution warmed up to approximately 70° C. The solution was kept at that temperature until complete disappearance of the Mg turnings.

Meanwhile, 2-chloropyrazine (4.75 mL) was dissolved in anh. THF (30 mL) and [1,2-bis(diphenylphosphino)ethane]dichloronickel(II) (510 mg) was added. To this suspension the solution of Grignard was added dropwise, at 0° C., under N₂. After the addition was complete, the reaction mixture was heated at reflux for 2 hr. The THF was evaporated, the residue poured in sat. aq. NaCl and the aqueous phase was extracted with DCM (3 \times). The organic extracts were dried, the solids were filtered and the solvent evaporated. The crude oil was purified by flash chromatography (CH/AcOEt 85:15) and then through a small column of Florsil (eluant: DCM) to eliminate the nickel residue (6.0 g): 2-(4-fluoro-2-methyl-phenyl)pyrazine (6.0 g) was obtained as a pale yellow solid.

2-(4-Fluoro-2-methyl-phenyl)pyrazine (0.3 g) dissolved in EtOH 95% (20 mL) and 37% HCl (0.2 mL) was hydrogenated at 5 atm. for 4 hr, in the presence of 20% Pd(OH)₂/C (30 mg) as catalyst. The catalyst was filtered off and the solvent was evaporated. The crude residue was triturated in MeOH/AcOEt (5 mL/15 mL) to obtain the title compound (0.08 g) as a white powder.

1) To a suspension of magnesium turnings (617 mg) in anh. THF (6 mL), at r.t., under N₂, a small crystal of I₂ was added, followed by 10% of a solution of commercial 2-bromo-5-fluorotoluene (4.0 g) in anh. THF (15 mL). The suspension was heated gently (heat gun) until the brown colour disappeared. The remaining bromide solution was added drop-wise, maintaining the reaction mixture warm (50–60° C.) with an oil bath. After the addition was complete (15 min), the suspension was stirred at 70° C. until the magnesium turnings had almost completely reacted (2 hr). The new brown solution was used in the next step.

2) A solution of LiBr (4.41 g) in anh. THF (50 mL) was added drop-wise to a suspension of CuBr (3.64 g) in anh. THF (50 mL). The reaction mixture was stirred at r.t. for 1 hr (dark green solution with a small amount of white solid in suspension). The Grignard solution previously prepared was then added dropwise (an ice bath was used to maintain the temperature <25° C.) followed by methyl oxalyl chloride (1.95 mL). The reaction mixture was stirred at r.t. for 2 hr. The THF was evaporated and the residue was taken up in AcOEt. The organic layer was washed with sat.aq. NH₄Cl (2×) and dried. The solids were filtered and the solvent evaporated to give a crude oil. which was purified by flash chromatography (CH/AcOEt 95:5) to obtain the title compound as a clear oil (2.44 g).

The affinity of the compound of the invention for NK1 receptor was determined using the NK₁-receptor binding affinity method measuring in vitro by the compounds' ability to displace [3H]—substance P (SP) from recombinant human NK₁ receptors expressed in Chinese Hamster Ovary (CHO) cell membranes. The affinity values are expressed as negative logarithm of the inhibition constant (K_i) of displacer ligands (pK_i).

The ability of the compounds of the invention at the nk1 receptor may be determined using the gerbil foot tapping model as described by Rupniak & Williams, Eur. Jour. of Pharmacol., 1994.

The compound was administered orally and one hour later an NK1 agonist (e.g. delta-Aminovaleryl⁶[Pro⁹,Me-Leu¹⁰]-substance P (7–11)) (3 pmol in 5 μL, icv) was infused directly in the cerebral ventricles of the animals. The duration of hind foot tapping induced by the NK1 agonist (e.g. delta-Aminovaleryl⁶[Pro⁹,Me-Leu¹⁰]-substance P (7–11)) was recorded continuously for 3 min using a stop-clock. The dose of the test compound required to inhibit by 50% the tapping induced by the NK1 agonist (e.g. delta-Aminovaleryl⁶[Pro⁹,Me-Leu¹⁰]-substance P (7–11)) expressed as mg/kg was referred as the ID50 values. Alternatively the compounds may be administered subcutaneously or intraperitoneally.

Representative results obtained for compounds of the invention when given by oral administration are given in the following table

Ex No	ED ₅₀ (mg/dg po)
19	0.04
20	0.065
21	0.4
36	0.05

No untoward effects have been observed when compounds of the invention have been administered to the gerbil at the pharmacological active doses.
