US00RE46308E

(19) **United States**
(12) **Reissued Patent**
Mateos Martin
(10) **Patent Number: US RE46,308 E**
(45) **Date of Reissued Patent: *Feb. 14, 2017**

(54) **DUAL FUEL HEATER**

(71) Applicant: **Coprecitec, S.L.**, Aretxabaleta (Gipuzkoa) (ES)

(72) Inventor: **Ruben Mateos Martin**, Marietta, GA (US)

(73) Assignee: **Coprecitec, S.L.**, Aretxabaleta, Gipuzkoa (ES)

(*) Notice: This patent is subject to a terminal disclaimer.

(21) Appl. No.: **14/865,176**

(22) Filed: **Sep. 25, 2015**

Related U.S. Patent Documents

Reissue of:

(64) Patent No.: **8,777,609**
Issued: **Jul. 15, 2014**
Appl. No.: **13/801,003**
Filed: **Mar. 13, 2013**

U.S. Applications:

(63) Continuation of application No. 13/278,931, filed on Oct. 21, 2011, now Pat. No. 8,403,661, which is a continuation-in-part of application No. 12/237,131, filed on Sep. 24, 2008, now Pat. No. 8,118,590, which is a continuation-in-part of application No. 11/684,368, filed on Mar. 9, 2007, now Pat. No. 7,766,006.

DUAL FUEL HEATER

Matter enclosed in heavy brackets [ ] appears in the original patent but forms no part of this reissue specification; matter printed in italics indicates the additions made by reissue; a claim printed with strikethrough indicates that the claim was canceled, disclaimed, or held invalid by a prior post-patent action or proceeding.

CROSS-REFERENCE TO RELATED APPLICATIONS

This application is a continuation of U.S. application Ser. No. 13/278,931 filed Oct. 21, 2011, which is a continuation-in-part to U.S. application Ser. No. 12/237,131, filed Sep. 24, 2008, which is a continuation-in-part to U.S. application Ser. No. 11/684,368, filed Mar. 9, 2007.

TECHNICAL FIELD

The present invention relates generally to gas heaters and, more particularly, to unvented gas heaters.

BACKGROUND

Unvented gas heaters are designed to be used indoors without pipes, ducts, or other conduit to vent the heater's exhaust to the exterior atmosphere. Vent free gas heaters typically include one or more gas burners and optionally one or more ceramic containing heating elements in a housing and optionally one or more artificial logs. The gas and air mix in the heater where combustion takes place. These heaters may have a blower to force air flow through the heater providing the release of heated gases or convective heat.

Unvented gas heaters have been designed to be free standing, mounted on a wall, or in a decorative housing such as a vent free fireplace. The housing providing a vent free fireplace is typically substantially the size of a fireplace and has artificial logs. Some have even been designed with a glass front to provide the appearance of an enclosed fireplace.

The unvented heaters of the prior art are typically designed to use either natural gas or liquid propane gas as a fuel source. It is not permitted for a manufacturer to supply a conversion kit for an unvented gas heater to convert from one fuel source to another in the field. Even if such a conversion kit were permitted, as is the case with vented gas heaters, to change fuel source gas type on a heater in the field, requires the installer to change the regulator, pilot orifice and burner orifice for the alternate gas type.

SUMMARY OF THE DISCLOSURE

A dual fuel gas burner is provided for use in a vent free heater. Embodiments of the dual fuel vent free gas burner can be used in free standing heaters, wall mount heaters, gas fireplaces, or other vent free heaters as is known in the art. A dual fuel vent free gas heater provides convective and/or radiant heat preferably to an indoor environment. The heater may be designed to use natural convective air currents and may optionally have a fan enhancing the natural convective currents within the heater. Alternatively, a fan may be used to force the gases and/or air within the heater at desired flow patterns which may be counter to natural convective forces.

This gas heater can be operated with multiple fuels such as liquid propane or natural gas without changing or adding components or parts. In some embodiments, an installer turns a selector valve plumbed in the product gas train. This selection sends the correct gas type to the correct fuel injector and pilot burner. Preferably, all internal plumbing connections are performed at the factory rather than onsite by the user or installer.

Embodiments of the gas heater can be operated on liquid propane or natural gas by connecting the fuel supply to the correct regulator on the heater. The installer or user then turns a selector valve, in selected embodiments, plumbed in the product gas train. This selection sends the correct gas type to the correct injector and pilot burner for the supply gas. Optionally, an oxygen detection system is incorporated within the heater. Advantageously, the heater is thermostatically controlled.

According to one implementation a dual fuel heater is provided comprising: a first oxygen depletion sensor adapted for a first fuel, a second oxygen depletion sensor adapted for a second fuel, a main burner adapted for both the first fuel and the second fuel, a single pressure regulator having a single fuel inlet and a single fuel outlet and adapted to regulate the pressure at the single fuel outlet of the first fuel delivered at the single fuel inlet at a first pressure or the second fuel delivered at the single fuel inlet at a second pressure, a control valve having a first inlet fluid communicable with a first outlet and a second outlet, the first inlet coupled to the single fuel outlet of the single pressure regulator, the control valve adapted to control the flow of fuel to the first and second oxygen depletion sensors through the first outlet and to control the flow of fuel to the main burner through the second outlet, a selector valve comprising a first inlet fluid communicable with a first outlet and a second inlet fluid communicable with a second outlet, the first inlet of the selector valve coupled with the first outlet of the control valve by a first conduit, the second inlet of the selector valve coupled with the second outlet of the control valve by a second conduit, the first outlet of the selector valve in fluid communication with the first oxygen depletion sensor, the second outlet of the selector valve in fluid communication with the main burner, the selector valve comprising a regulating organ adapted to transition between a first selector position and a second selector position, in the first selector position the regulating organ permitting the flow of fuel between the second inlet and second outlet of the selector valve through a first orifice in the regulating organ calibrated for the first fuel and also permitting the flow of fuel between the first inlet and first outlet of the selector valve, in the second selector position the regulating organ permitting the flow of fuel between the second inlet and second outlet of the selector valve through a second orifice in the regulating organ calibrated for the second fuel and also preventing the flow of fuel between the first inlet and first outlet of the selector valve, the second oxygen depletion sensor in fluid communication with the first conduit that couples the first outlet of the control valve with the first inlet of the selector valve.

In one implementation the first fuel is natural gas and the second fuel is liquefied petroleum gas, while in another implementation the first fuel is natural gas and the second fuel is butane.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. **1** is a front perspective view of an embodiment of a dual fuel vent free heater showing heater components thereof assembled within a housing;

FIG. **2** is a cut-away view of the dual fuel vent free heater of FIG. **1** showing an oxygen detection system;

FIG. **3** is a schematic view of the dual fuel vent free heater of FIG. **1** showing flow connection of component parts;

FIG. **4** is a schematic view of a dual fuel vent free heater having a single multiuse injector and a thermal switch;

FIG. **5** is a schematic view of a dual fuel vent free heater having a dual burner configuration;

FIG. **6** is a schematic view of a dual fuel vent free heater having a dual burner and dual thermostatic control configuration;

FIG. **7** is a schematic view of a dual fuel vent free heater having a multi-positional manual control valve, a thermal switch, and a thermostatic control valve;

FIG. **8**, which includes and is defined by sub-part FIGS. **8**A and **8**B, provides blow-up views of the multi-positional manual control valve of FIG. **7**;

FIG. **9** is a schematic view of a dual fuel vent free heater having a multi-positional manual control valve, a thermal switch, a thermostatic control valve, and pilot burners aligned on a similar side of a burner;

FIG. **10** is schematic view of the dual fuel vent free heater having a first burner, a second burner, and a cross-over burner for use in a vent free fireplace unit;

FIG. **11** is a schematic view of a dual fuel vent free heater having a multi-positional manual control valve directly controlling the flow of fuel into the heater;

FIG. **12** is a schematic view of a dual fuel vent free heater having a multi-positional manual control valve, a thermal switch, a thermostatic control valve, a single fuel injector, linkage, and pilot burners aligned on opposite sides of a burner;

FIG. **13** is an isometric view of the multi-positional manual control valve of FIG. **12**;

FIG. **14** is a schematic view of a dual fuel vent free heater having a multi-positional manual control valve, a thermal switch, a thermostatic control, a single fuel injector, and a pilot flame burner equipped for use with two fuels; and

FIG. **15** is an isometric view of the pilot flame burner equipped for use with two fuels of FIG. **14**.

FIG. **16** is a schematic view of a dual fuel vent free heater according to another implementation.

FIG. **17** is a schematic view of a dual fuel vent free heater according to another implementation.

DETAILED DESCRIPTION

The following description describes embodiments of a dual fuel vent free heater. In the following description, numerous specific details and options are set forth in order to provide a more thorough understanding of the present invention. It will be appreciated, however, by one skilled in the art that the invention may be practiced without such specific details or optional components and that such descriptions are merely for convenience and that such are selected solely for the purpose of illustrating the invention. As such, reference to the figures showing embodiments of the present invention is made to describe the invention and not to limit the scope of the disclosure and claims herein.

FIGS. **1**, **2** and **3** show dual fuel vent free heater **100**. FIG. **1** shows the component parts of dual fuel vent free heater **100** in a housing **180** and FIG. **3** shows the flow diagram of heater **100**. Dual fuel vent free gas heater **100** comprises a gas burner **132** having a plurality of gas outlet ports **155** (shown in FIG. **2**) in an upper surface thereof. It is to be understood that outlet ports **155** may be in a side and/or lower surface of gas burner **132** and gas burner **132** may be situated vertically or angled within housing **180** and still be within the scope of this invention. Gas outlet ports **155** are in flow communication with pilot flame burners **120** and **122**. Brackets **139** hold pilot flame burners **120** and **122**, piezometric igniters **157** and **159**, and temperature sensors **152**a and **154**a proximate burner **132**. Piezometric igniters **157** and **159** are adjacent to pilot flame burners **122** and **120** respectively. Fuel injectors **126** and **128** are in flow communication with the interior portion of gas burner **132**. Bracket **124** holds fuel injectors **126** and **128** at an injection angle with respect to a longitudinal axis of gas burner **132** other then 0°. Injectors **126** and **128** are non-concentrically aligned with a burner venturi within burner **132**. Bracket **124** controls the angle of each injector with the axis of the burner or venturi. This angle may be varied depending on the size of the burner. Optionally, an oversized venturi may accommodate non-concentric injectors **126** and **128**. Preferably, bracket **124** has threaded apertures for accommodation of injectors having a threaded outer annular surface. Preferably, the injection angle of each injector is of the same magnitude. Fuel supply lines **134** and **136** are in flow communication with fuel injectors **126** and **128** respectively. Fuel supply line **134** and injector **126** have a composition and configuration for transporting a fuel such as natural gas or liquid propane at a desired flow rate and fuel supply line **136** and injector **128** have a composition and configuration for transporting a different fuel such as the other of natural gas or liquid propane at a desired flow rate.

FIG. **2** is a cutaway portion of dual fuel vent free heater **100** showing an oxygen detection system. Oxygen detection control system **131**, shown schematically in FIG. **3**, is in electrical communication with temperature sensors **152**a and **154**a and thermostatic control **130** wherein thermostatic control **130** has valves controlling the flow of fuels to injectors **126** and **128** and pilot flame burners **120** and **122**. The term “thermostatic control” is used broadly throughout this specification and is not limited to controls having a temperature sensing component. Rather, the term encompasses a broad range of controls that may be implementable into a dual fuel heater, including, but not limited to, controls having a temperature sensing component as well as control s that are manually or electrically activated. Oxygen detection control system **131** sends an electrical signal to thermostatic control **130** directing thermostatic control **130** to close the valves shutting off the flow of fuel when a temperature sensor **152**a or **154**a indicates a temperature less than a control temperature thereby indicating a low oxygen level condition.

Dual fuel vent free gas heater **100** comprises two regulators **112** and **114** in flow communication with “T” connector **110** via fuel lines **148** and **150** respectively. Fuel line **146** extends from “T” connector **110** to thermostatic control **130**. Pilot line **144** leads from thermostatic control **130** to pilot control valve **118**. Injector line **142** leads from thermostatic control **130** to injector control valve **116**. Fuel lines **138** and **140** lead from pilot control valve **118** to pilot flame burners **122** and **120** respectively. Fuel lines **136** and **134** lead from injector control valve **116** to injectors **126** and **128** respectively. Control valves **118** and **116** are manually adjusted for the fuel type being connected to regulator **112** or **114**. Typically control valves **118** and **116** each have a setting for natural gas and a setting for liquid propane gas and are adjusted according to the fuel connected to regulator **112** or **114**.

FIG. **4** shows a schematic view of dual fuel vent free heater **400** having a single burner **132** and a thermal switch **458**. Gas burner **132** has a plurality of gas outlet ports. Fuel injector **426** is in flow communication with fuel supply line **134** and an interior of gas burner **132**. Fuel injector **426** has a manual control valve therein for controlling the flow of a fuel to burner **132**. Injector **426** has at least two settings for adjustment to alternate between at least two different fuels being fed from regulator **112** or regulator **114** through fuel supply line **134**. Fuel supply line **134** is in flow communication with thermostatic control 130. Fuel line **140** is in flow communication with thermostatic control **130** and pilot burner **120** and has regulator **456** inline therewith. Regulators **114** and **112** each have back flow prevention systems or a plug **411** allowing a single fuel tank to be connected to either regulator leaving the other regulator without a fuel source. Regulators **112** and **114** are each in flow communication with a "T" connector via fuel lines **148** and **150** respectively. Fuel inlet line **146** extends from the "T" connector and feeds into thermostatic control **130**. Thermal switch **458** is in electrical communication with thermostatic control **130** and temperature sensor **154**a. Temperature sensor **154**a is in proximity to pilot burner **120** and primary burner **132** as shown. Thermal switch **458** sends an electrical signal to thermostatic control **130** shutting off fuel flow to fuel supply line **134** and pilot burner supply line **140** in the event that an incorrect setting is made with injector **426** with respect to the fuel being fed to regulator **112** or **114** by measuring a high temperature condition via temperature sensor **154**a at burner **132**.

In an alternative embodiment thermal switch **458** is still in electrical communication with thermostatic control **130** and temperature sensor **154**a, but does not measure a high temperature condition via temperature sensor **154**a. Rather, thermal switch **458** has internal temperature sensing and is appropriately positioned in dual fuel vent free heater **400** to measure a high temperature condition. For example, thermal switch **458** may be a normally closed switch that is opened upon expansion of one or more metals, such as a snap disc, caused by a set temperature being reached. In this alternative embodiment, communication between temperature sensor **154**a and thermostatic control **130** is ceased when the wrong fuel type is introduced and a high temperature condition is measured via thermal switch **458**, causing the supply of gas to be shut off by thermostatic control **130**.

FIG. **5** shows dual fuel vent free heater **500** having a dual burner configuration. Two regulators **112** and **114** are in flow communication with a "T" connector via fuel lines **148** and **150** respectively. Fuel line **146** extends from the "T" connector to thermostatic control **130**. Pilot burner supply lines **138** and **140** lead from thermostatic control **130** to pilot flame burners **122** and **120** respectively. Fuel injector lines **134** and **136** lead from thermostatic control **130** to injectors **126** and **128** respectively. Burner **132**a has first pilot flame burner **122** proximate gas outlet apertures therein and injector **126** proximate an axial opening. Burner **132**b has pilot flame burner **120** proximate gas outlet apertures and injector **128** proximate an axial opening therein.

FIG. **6** is a schematic view of a dual fuel vent free heater **600** having a dual burner and dual thermostatic control configuration. Regulator **112** is in flow communication with thermostatic control **130**a via fuel line **148**. Regulator **114** is in flow communication with thermostatic control **130**b via fuel line **150**. Pilot supply line **140** leads from thermostatic control **130**a to pilot flame burner **120** and pilot supply line **138** leads from thermostatic control **130**b to pilot flame burner **122**. Injector supply line **134** leads from thermostatic control **130**a to fuel injector **126**. Injector supply line **136** leads from thermostatic control **130**b to fuel injector **128**. Burner **132**a has pilot flame burner **120** proximate gas outlet apertures and fuel injector **126** proximate an axial opening. Burner **132**b has pilot flame burner **122** proximate gas outlet apertures and fuel injector **128** proximate an axial opening therein.

FIG. **7** shows a schematic view of dual fuel vent free heater **700** having a multi-positional manual control valve **800**. Regulators **112** and **114** are in flow communication with a "T" connector via fuel lines **148** and **150** respectively. Fuel line **146** extends from the "T" connector to thermostatic control **130**. Pilot line **142** and injector line **144** lead from thermostatic control **130** to multi-positional manual control valve **800**. Multi-positional manual control valve **800** directs flow from pilot line **142** and injector line **144** to pilot supply line **140** and injector supply line **136**, or pilot supply line **138** and injector supply line **134**, or blocks the flow from pilot line **142** and injector line **144**. Burner **132** has injectors **126** and **128** held at an angle to the burner axis in proximity to the burner opening with bracket **124**. Pilot burners **120** and **122** are proximate the outer surface of burner **132** and are in flow communication with pilot supply line **140** and **138** respectively. Thermal switch **158** is in electrical communication with T/C block **756**. T/C block **756** is in electrical communication with a temperature sensor **152**a, **154**a proximate each pilot burner **120** and **122** and primary burner **132**, via T/C lines **154** and **152**, and thermostatic control **130**. In the event an incorrect setting is made with respect to the fuel being fed to the correct injector and pilot burner, thermal switch **158** or thermostatic control **130** shuts off the flow of gas to heater **700** by reading of a high temperature condition near burner **132**.

FIG. **8** which includes and is defined by sub-part FIGS. **8**A and **8**B shows a blow-up view of multi-positional manual control valve **800**. Multi-positional manual control valve **800** comprises a control block **804** and a control cylinder **802**. Control block **804** has a cylindrical aperture **850** extending from a front surface to a rear surface. The front surface of control **800** has fuel selection and cut off indicators LP, NG, and OFF. Three fuel injector apertures **820**, **824** and **830** extend from cylindrical aperture **850** at about 90° intervals to a left side, top, and right side of control block **804**. A pilot aperture is axially aligned about cylindrical aperture **850** with each fuel injector aperture, pilot aperture **822** is axial aligned with injector aperture **820**, pilot aperture **826** is axial aligned with injector aperture **824**, and pilot aperture **828** is axial aligned with injector aperture **830**. Control cylinder **802** has an outer circumference proximate the circumference of cylindrical aperture **850** in control block **804** wherein control cylinder **802** is closely received within. Control cylinder **802** has "L" shaped flow through fuel injector aperture **812** and an axially aligned "L" shaped flow through pilot aperture **814**. Control cylinder **802** has a first, second, and third, position within the cylindrical aperture in control block **804**. The front surface of control cylinder **802** has a selection arrow pointing to an appropriate indicator on the front surface of control block **804**. At a first position, fuel injector aperture **820** and pilot aperture **822** are in flow communication with fuel injector aperture **824** and pilot aperture **826**. At a second position, as shown in FIG. **8**B, fuel injector aperture **824** and pilot aperture **826** are in flow communication with fuel injector aperture **830** and pilot aperture **828**. At the third position, one end of the "L" shaped flow through fuel injector aperture **812** and axially aligned "L" shaped flow through pilot aperture **814** are blocked by the wall of cylindrical aperture **850** in control block **804** cutting off the flow of fuel.

FIG. **9** shows a schematic view of dual fuel vent free heater **900**. Dual fuel vent free heater **900** comprises two regulators **112** and **114** in flow communication with a "T" connector via fuel lines **148** and **150**. Fuel line **146** extends from the "T" connector to thermostatic control **130**. A pilot line **142** and an injector line **144** lead from thermostatic control **130** to multi-positional manual control valve **800**. Multi-positional manual control valve **800** has a first, second, and third control position as indicated with LP, NG, and OFF. The first control position creates a flow communication between the pilot line **144** and injector line **142** leading from thermostatic control **130** with pilot flame burner **120** and injector **128** through pilot feed line **140** and injector feed line **136** respectively. The second control position creates a flow communication between pilot line **144** and injector line **142** leading from thermostatic control **130** with pilot flame burner **122** and injector **126** respectively. The third position cuts off fuel flow from pilot line **144** and injector line **142** leading from thermostatic control **130**. Thermal switch **935** is in electrical communication with a temperature sensor proximate pilot flame burners **120** and **122** and primary burner **132** as shown via electrical connectors **154** and **152** respectively through thermo control block (T/C block) **933**. Thermal switch **935** sends a shut off signal to thermostatic control **130** when a first set temperature is exceeded in burner **132** indicating a wrong fuel setting and cutting off the flow of fuel to heater **900**. Embodiments incorporating this safety shut-off feature and the safety shut-off feature shown in FIG. **2** and previously described, shutting off fuel flow to the gas heater in the event a set temperature is exceeded, provide complete fuel shut-off functionality.

FIG. **16** shows a schematic view of a dual fuel vent free heater **1500**. Dual fuel vent free heater **1500** comprises a single pressure regulator **115** in flow communication with thermostatic control **130** via fuel line **146**. A pilot line **144** and an injector line **142** lead from thermostatic control **130** to multi-positional manual control valve **910**. Multi-positional manual control valve **910** has at least first and second control position as indicated with P**1** and P**2**. The first control position P**1** creates a flow communication between the pilot line **144** and injector line **142** leading from thermostatic control **130** with pilot flame burner **122** and injector **126** through pilot feed line **138** and injector feed line **134**, respectively. The second control position P**2** creates a flow communication between injector line **142** leading from thermostatic control **130** with injector **128** through injector feed line **136**. When in the second control position P**2** flow communication between pilot line **144** and pilot flame burner **122** is prevented. When the selector valve **910** is in both the first control position P**1** and the second control position P**2** flow communication between the thermostatic control valve **130** and pilot flame burner **120** is maintained through pilot feed line **140**. In one implementation thermal switch **935** is in electrical communication with a temperature sensor proximate pilot flame burners **120** and **122** and primary burner **132** as shown via electrical connectors **154** and **152**, respectively, through thermo control block (T/C block) **933**. Thermal switch **935** sends a shut off signal to thermostatic control **130** when a first set temperature is exceeded in burner **132** indicating a wrong fuel setting and cutting off the flow of fuel to heater **1500**. Embodiments incorporating this safety shut-off feature and the safety shut-off feature shown in FIG. **2** and previously described, shutting off fuel flow to the gas heater in the event a set temperature is exceeded, provide complete fuel shut-off functionality.

In one implementation the single pressure regulator **115** has a single fuel inlet and a single fuel outlet and is adapted to regulate the pressure at the single fuel outlet of a first fuel delivered at the single fuel inlet at a first pressure or a second fuel delivered at the single fuel inlet at a second pressure. In one implementation the pressure regulator is equipped with a selector **117** that is moveable between at least first and second positions. When in the first position the pressure regulator **115** is adapted to regulate the pressure at the single fuel outlet of the first fuel and when in the second position the pressure regulator **115** is adapted to regulate the pressure at the single fuel outlet of the second fuel. In one implementation the first fuel is natural gas and the second fuel is liquefied propane gas, while in another implementation the first fuel is natural gas and the second fuel is butane. In one implementation the pressure regulator **115** comprises a dual gas pressure regulator like that disclosed in U.S. Pat. No. 7,600,529 which is incorporated herein by reference in its entirety.

As previously discussed, the pilot flame burners **120** and **122** each form a part of an oxygen depletion sensor that include temperature sensors **152**a and **154**a, respectively. Each of the pilot flame burners **120** and **122** is also associated with a piezometric igniter **157** and **159**, respectively. According to one implementation, pilot flame burner **122** comprises a first injector at an inlet thereof adapted for the introduction of natural gas while pilot flame burner **120** comprises a second injector at an inlet thereof adapted for the introduction of liquefied propane gas. According to another implementation, pilot flame burner **122** comprises a first injector at an inlet thereof adapted for the introduction of natural gas while pilot flame burner **120** comprises a second injector at an inlet thereof adapted for the introduction of butane. In one implementation, because pilot flame burner **120** is situated to receive a fuel whenever a fuel flow is established through the thermostatic control valve **130**, piezometric igniter **157** is activated each time piezometric igniter **159** is activated.

FIG. **17** shows a schematic view of a dual fuel vent free heater **1600**. Dual fuel vent free heater **1600** comprises a single pressure regulator **115** in flow communication with thermostatic control **130** via fuel line **146**. A pilot line **144** and an injector line **142** lead from thermostatic control **130** to multi-positional manual control valve **920**. Multi-positional manual control valve **920** has at least first and second control position as indicated with P**1** and P**2**. The first control position P**1** creates a flow communication between the pilot line **144** and injector line **142** leading from thermostatic control **130** with pilot flame burner **122** and injector **127** through pilot feed line **138** and injector feed line **134**, respectively. The second control position P**2** creates a flow communication between injector line **142** leading from thermostatic control **130** with injector **127** through injector feed line **134**. When in the second control position P**2** flow communication between pilot line **144** and pilot flame burner **122** is prevented. When the selector valve **920** is in both the first control position P**1** and the second control position P**2** flow communication between the thermostatic control valve **130** and pilot flame burner **120** is maintained through pilot feed line **140**.

In one implementation the manual control valve **920** comprises a regulating organ having at least a first orifice and a second orifice, the first orifice calibrated for the delivery of a first fuel (e.g., natural gas) to the main burner fuel injector **127**, the second orifice calibrated for the delivery of a second fuel (e.g., liquefied petroleum gas, butane, etc.) to fuel injector **127**. In such an implementation when the manual control valve **920** is in the first control position P**1**, flow communication between fuel lines **142** and **134** is established through the first orifice and when the manual control valve **920** is in the first control position P**1**, flow communication between fuel lines **142** and **134** is established through the second orifice.

In one implementation thermal switch **935** is in electrical communication with a temperature sensor proximate pilot flame burners **120** and **122** and primary burner **132** as shown via electrical connectors **154** and **152**, respectively, through thermo control block (T/C block) **933**. Thermal switch **935** sends a shut off signal to thermostatic control **130** when a first set temperature is exceeded in burner **132** indicating a wrong fuel setting and cutting off the flow of fuel to heater **1600**. Embodiments incorporating this safety shut-off feature and the safety shut-off feature shown in FIG. **2** and previously described, shutting off fuel flow to the gas heater in the event a set temperature is exceeded, provide complete fuel shut-off functionality.

In one implementation the single pressure regulator **115** has a single fuel inlet and a single fuel outlet and is adapted to regulate the pressure at the single fuel outlet of a first fuel delivered at the single fuel inlet at a first pressure or a second fuel delivered at the single fuel inlet at a second pressure. In one implementation the pressure regulator is equipped with a selector **117** that is moveable between at least first and second positions. When in the first position the pressure regulator is adapted to regulate the pressure at the single fuel outlet of the first fuel and when in the second position the pressure regulator is adapted to regulate the pressure at the single fuel outlet of the second fuel. In one implementation the first fuel is natural gas and the second fuel is liquefied propane gas, while in another implementation the first fuel is natural gas and the second fuel is butane. In one implementation the pressure regulator **115** comprises a dual gas pressure regulator similar to that disclosed in U.S. Pat. No. 7,600,529 which is incorporated herein by reference in its entirety.

As previously discussed, the pilot flame burners **120** and **122** each form a part of an oxygen depletion sensor that include temperature sensors **152**a and **154**a, respectively. Each of the pilot flame burners **120** and **122** is also associated with a piezometric igniter **157** and **159**, respectively. According to one implementation, pilot flame burner **122** comprises a first injector at an inlet thereof adapted for the introduction of natural gas while pilot flame burner **120** comprises a second injector at an inlet thereof adapted for the introduction of liquefied propane gas. According to another implementation, pilot flame burner **122** comprises a first injector at an inlet thereof adapted for the introduction of natural gas while pilot flame burner **120** comprises a second injector at an inlet thereof adapted for the introduction of butane. Because pilot flame burner **120** is situated to receive a fuel whenever a fuel flow is established through the thermostatic control valve **130**, piezometric igniter **157** is activated each time piezometric igniter **159** is activated.

FIG. **10** shows a schematic view of dual fuel vent free heater **1000** having burner **132**a, **132**b, and cross-over burner **171**. Such a configuration provides a blue flame burner and a yellow flame burner as is often desirable in a vent free fireplace heater. The configuration of heater **1000** is similar to the configuration of heater **900** with the addition of burners **132**b, cross-over burner **171**, two fuel line "T" connectors, and fuel injectors **126**b and **128**b. Crossover burner **171** is in flow communication with burners **132**a and **132**b. Burner **132**b has fuel injectors **126**b and **128**b held by bracket **124**b proximate an axial end and is situated substantially parallel burner **132**a. Fuel supply line **134**b feeds injector **126**b with a "T" connector in t10w communication with fuel supply line **134**a. Fuel supply line **136**b feeds injector **128**b with a "T" connector in flow communication with fuel supply line **136**a. The statement: "Two burners or parts of burners that are in flow communication with each other" implies either that there is an opening or a connection between the two burners that allows a gas to flow from one to the other, or that some of the openings in each burner are in close proximity with each other to allow the burning gasses from one burner to ignite the gasses emanating from the other.

FIG. **11** is a schematic view of dual fuel vent free heater **1100** having a multi-positional manual control valve **800** directly controlling the flow of fuel into heater **1100**. The configuration of heater **1100** is similar to that of heater **900** but does not have thermostatic control **130**. Rather, fuel from either regulator **112** or regulator **114** is fed through fuel line **148** or **150**. Fuel lines **148** and **150** "T" into pilot line **142** and injector line **144** which lead directly to multi-positional manual control valve **800**. Therefore, the amount of heat produced by heater **1100** is manually controlled with multi-positional manual control valve **800** without any thermostatic control.

FIG. **12** shows a schematic view of dual fuel vent free heater **1200** having a multi-positional manual control valve **860**. The word "manual" in "multi-positional manual control valve" is not meant to limit multi-positional manual control valve **860** or other control valves mentioned herein to being actuated manually. Rather, as understood in the art, multi-positional manual control valve may encompass a number of control valves, such as those that are electronically or otherwise actuated. Regulators **112** and **114** are in flow communication with a "T" connector to thermostatic control **130** via fuel lines **148** and **150** respectively. Fuel line **146** extends from "T" connector to thermostatic control **130**. Pilot line **142** and injector line **144** lead from thermostatic control **130** to multi-positional manual control valve **860**. Multi-positional manual control valve **860** preferably has fuel selection indicators LP and NG that correspond to two different positions of multi-positional manual control valve **860**. Multi-positional manual control valve **860** directs flow from pilot line **142** to pilot supply line **140** or from pilot line **142** to pilot supply line **138** dependent upon whether the LP or NG position is selected. Additionally, multi-positional manual control valve **860** directs flow from injector line **144** to injector supply line **137** when the NG position is selected, while causing the flow from injector line **144** to injector supply line **137** to be restricted when LP is selected. Flow is restricted by decreasing the size of at least a portion of the orifice internal to multi-positional manual control valve **860** through which flow from injector line **144** to injector supply line **137** proceeds when LP is selected. Multi-positional manual control valve **860** may also be provided with a cut off indicator OFF that corresponds to an optional additional position of multi-positional manual control valve **860**. Such an indicator would block the flow from injector line **140** and pilot line **142** if the OFF position is selected. However, it is preferred that thermostatic control **130**, instead of multi-positional manual control valve **860**, be provided with controls for turning dual fuel vent free heater **1200** off.

Pilot burners **120** and **122** are proximate the outer surface of burner **132** and are in flow communication with pilot supply lines **140** and **138** respectively. Burner **132** has a single injector **427** held in proximity to the burner opening and preferably supported by bracket **125**. The flow of fuel through injector **427** is controlled by multi-positional manual control valve **860** when the appropriate fuel selection is made and no separate adjustment to fuel injector **427** is necessary when selecting a different fuel. Piezometric igniters **157** and **159** are adjacent to pilot flame burners **122** and **120**, respectively. Temperature sensors **152**a and **154**a are proximate to pilot flame burners **122** and **120** respectively and are in electrical communication with thermal switch **558**, which is in electrical communication with thermostatic control **130**.

Temperature sensors **152**a and **154**a are positioned such that when their respective pilot flame burners are lit with a safe oxygen level present, they will be in contact with or substantially close to the pilot flame to be sufficiently heated and resultantly supply a predetermined voltage through thermal switch **558**, if it is in the closed position, to thermostatic control **130**. If this voltage is not supplied, the supply of gas to burner **132** and pilot flame burner **120** and **122** will be shut off by thermostatic control **130**. This predetermined voltage will not be supplied when an unsafe oxygen level is present, since the pilot flame will no longer be substantially close to its respective temperature sensor **152**a or **154**a, causing temperature sensor **152**a or **154**a to be insufficiently heated and supply a voltage less than the predetermined voltage. In this embodiment, thermal switch **558** is preferably a normally closed switch with internal temperature sensing and is positioned in dual fuel vent free heater **1200** such that under normal heater operating conditions, it will reach a temperature that is under its set point. However, if the wrong gas type is introduced and burned in burner **132**, it will cause thermal switch **558** to heat to a temperature at or above its set point and be in the open position. This will break the communication between temperature sensors **152**a and **154**a and thermostatic control **130**, causing the supply of gas to injector **427** and pilot flame burners **120** and **122** to be shut off by thermostatic control **130**. The wrong gas type may be introduced in burner **132** by, among other things, feeding the wrong fuel to regulator **112** or **114**, malfunction of multi-positional manual control valve **860**, or by an incorrect setting on a fuel injector with a manual control valve.

Dual fuel vent free heater **1200** of FIG. **12** is also shown with a linkage **880** that interacts with an air shutter **133** and multi-positional manual control valve **860**. Linkage **880** adjusts the position of air shutter **133** based upon the selected position of multi-positional manual control valve **860**. Air shutter **133** is located proximal to fuel injector **427** and forms part of, or is attached to, or is in close proximity to burner **132**. Adjustment of air shutter **133** allows varying amounts of air to be received through an opening in burner **132** for ideal combustion of the selected fuel. For example, in some embodiments linkage **880** could cause air shutter **133** to completely cover the opening in burner **132** when NG is selected by multi-positional manual control valve **860** and to allow the opening in burner **132** to be completely exposed when LP is selected. Dual fuel vent free heater **1200** may also be provided with a linkage (not shown) that blocks the connection to either regulator **112** or **114** dependent upon which fuel is selected by multi-positional manual control valve **860**. The linkage would prevent connection to the regulator corresponding with the fuel that is not selected, preferably by blocking or obstructing the input to the given regulator.

Turning to FIG. **13**, an isometric view of a preferred embodiment of multi-positional manual control valve **860** is shown. Multi-positional manual control valve **860** has a pilot line aperture **862**, a LP pilot supply line aperture **864**, a NG pilot supply line aperture **866**, a fuel injector line aperture **870**, and a fuel injector supply line aperture **872**. Multi-positional manual control valve **860** also has an extension **882** which extends exteriorly and allows for attachment of a knob (not shown) for selection between LP and NG through rotational adjustment of internal orifices. In a first position, pilot line aperture **862** is in flow communication with LP pilot supply line aperture **864** and fuel injector line aperture **870** is in flow communication with fuel injector supply line aperture **872** and at least a portion of the internal orifice is restricted that communicates input from injector line aperture **870** to fuel injector supply line aperture **872**. In a second position, pilot line aperture **862** is in flow communication with NG pilot supply line aperture **866** and fuel injector line aperture **870** is in flow communication with fuel injector supply line aperture **872**.

FIG. **14** shows a schematic view of dual fuel vent free heater **1400**. Dual fuel vent free heater **1400** is similar to dual fuel vent free heater **1200**, except that it is shown without linkage **880** or air shutter **133** and has a single piezometric igniter **159**, a single temperature sensor **154**a, and a pilot flame burner equipped for use with two fuels **220**. Single temperature sensor **154**a preferably interacts with thermostatic control **130** to provide for an oxygen detection system as previously described and additionally preferably interacts with thermal switch **558** to provide for a complete safety shutoff system as previously described.

Turning to FIG. **15**, pilot flame burner equipped for use with two fuels **220** has a first fuel input orifice **222**, a second fuel input orifice **224**, and a single fuel nozzle **226**. First fuel input orifice **222** and second fuel input orifice **224** are shown in FIG. **14** in communication with pilot supply lines **140** and **138** respectively. Since multi-positional manual control valve **860** merely redirects flow from pilot line **142** to pilot supply line **138** or pilot supply line **140**, the initial orifice size of first fuel input orifice **222** and second fuel input orifice **224** are preferably substantially the same. However, at some point before the merger of first fuel input orifice **222** and second fuel input orifice **224**, the orifice size of first fuel input orifice **222** is restricted more than the orifice size of second fuel input orifice **224**.

In a preferred embodiment, where multi-positional manual control valve **860** is adjustable to direct flow from pilot line **142** to pilot supply line **138** if natural gas is being used and adjustable to direct flow from pilot line **142** to pilot supply line **140** if liquid propane is being used, first fuel input orifice **222** is preferably restricted to a diameter of approximately 0.30 mm at some point before the merger of first fuel input orifice **222** and second fuel input orifice **224**, whereas the minimum orifice size of second fuel input orifice **224** is approximately 0.42 mm. Of course, when natural gas and liquid propane are the two fuels being used the actual orifice sizes may vary to some degree while still allowing for a pilot flame burner with a single fuel nozzle that can be used with two fuels. Moreover, when other fuels are being used the actual orifice sizes may vary to an even larger degree. Restricting the orifice size of first fuel input orifice **222** more than the orifice size of second fuel input orifice **224** prior to the merger of the two, causes fuel volume to be restricted and allows single fuel nozzle **226** to function with either of two fuels. Moreover, the design and placement of pilot flame burner equipped for use with two fuels **220** enables fuel volume to be properly restricted without substantially affecting fuel velocity. Therefore, a single oxygen detection system having an igniter and at least one temperature sensor proximate a single fuel nozzle can be implemented into a number of dual fuel vent free heaters using pilot flame burner equipped for use with two fuels **220**.

U.S. Pat. No. 5,807,098 teaches several aspects of a gas heater and a gas heater oxygen detection system and is incorporated by reference into the present document in its entirety. Using teachings from U.S. Pat. No. 5,807,098 it is clear, among other things, how more than one temperature sensor may be used with a dual fuel heater having a pilot flame burner equipped for use with two fuels **220**, or other dual fuel heaters taught herein, to provide for added functionality. Moreover, it is clear that input could be diverted to either pilot line **142** or pilot supply line **138** and resultantly first fuel input orifice **222** and second fuel input orifice **224** of pilot flame burner equipped for use with two fuels **220** through use of other valves besides multi-positional manual control valve **860**.

What is claimed is:

1. A dual fuel heater comprising: a first oxygen depletion sensor adapted for a first fuel, a second oxygen depletion sensor adapted for a second fuel, a main burner adapted for both the first fuel and the second fuel,

a control valve having a first inlet fluid communicable with a first outlet and a second outlet, the first inlet configured to receive the first fuel and the second fuel, the control valve adapted to control the flow of fuel to the first and second oxygen depletion sensors through the first outlet and to control the flow of fuel to the main burner through the second outlet,

a selector valve comprising **[**a first**]** *an* inlet fluid communicable with **[**a first**]** *an* outlet **[**and a second inlet fluid communicable with a second outlet**]**, the **[**first**]** inlet of the selector valve coupled with the first outlet of the control valve by a first conduit, **[**the second inlet of the selector valve coupled with the second outlet of the control valve by a second conduit,**]** the **[**first**]** outlet of the selector valve in fluid communication with the first oxygen depletion sensor, **[**the second outlet of the selector valve in fluid communication with the main burner,**]** the selector valve adapted to transition between a first selector position and a second selector position, in the first selector position the selector valve **[**adapted to permitting**]** *permits* the flow of the first fuel between the **[**second**]** inlet and **[**second**]** outlet of the selector valve **[**and also to permit the flow of the first fuel between the first inlet and first outlet of the selector valve**]**, in the second selector position the selector valve **[**adapted to permitting the flow of the second fuel between the second inlet and second outlet of the selector valve and also prevent**]** *prevents* the flow of the **[**second**]** *first* fuel between the **[**first**]** inlet and **[**first**]** outlet of the selector valve,

the flow of the first fuel and the second fuel being permitted to the second oxygen depletion sensor via the first conduit **[**from a location between the first outlet of the control valve and the first inlet of the selector valve**]** so that the flow of the first fuel and the second fuel to the second oxygen depletion sensor is permitted regardless of whether the selector valve is in the first selector position or in the second selector position.

2. A dual fuel heater according to claim **1**, wherein the first fuel is natural gas and the second fuel is liquefied petroleum gas.

3. A dual fuel heater according to claim **1**, wherein the first fuel is natural gas and the second fuel is butane.

[4. A dual fuel heater comprising:

a first oxygen depletion sensor adapted for a first fuel,

a second oxygen depletion sensor adapted for a second fuel,

a main burner adapted for both the first fuel and the second fuel,

a control valve having a first inlet fluid communicable with a first outlet and a second outlet, the first inlet configured to receive the first fuel and the second fuel, the control valve adapted to control the flow of fuel to the first and second oxygen depletion sensors through the first outlet and to control the flow of fuel to the main burner through the second outlet,

a selector valve comprising a first inlet fluid communicable with a first outlet and a second inlet fluid communicable with a second outlet and a third outlet, the first inlet of the selector valve coupled with the first outlet of the control valve by a first conduit, the second inlet of the selector valve coupled with the second outlet of the control valve by a second conduit, the first outlet of the selector valve in fluid communication with the first oxygen depletion sensor, the second and third outlets of the selector valve in fluid communication with the main burner, the selector valve adapted to transition between a first selector position and a second selector position, in the first selector position the selector valve is adapted to permit the flow of the first fuel between the second inlet and second outlet of the selector valve and also to permit the flow of the first fuel between the first inlet and first outlet of the selector valve, in the second selector position the selector valve adapted to permit the flow of the second fuel between the second inlet and third outlet of the selector valve and also prevent the flow of the second fuel between the first inlet and first outlet of the selector valve,

the flow of the first fuel and the second fuel being permitted to the second oxygen depletion sensor via the first conduit from a location between the first outlet of the control valve and the first inlet of the selector valve so that the flow of the first fuel and the second fuel to the second oxygen depletion sensor is permitted regardless of whether the selector valve is in the first selector position or in the second selector position.**]**

[5. A dual fuel heater according to claim **4**, wherein the first fuel is natural gas and the second fuel is liquefied petroleum gas.**]**

[6. A dual fuel heater according to claim **4**, wherein the first fuel is natural gas and the second fuel is butane.**]**

7. A dual fuel heater according to claim 1, wherein the flow of the first fuel and the second fuel is permitted to the second oxygen depletion sensor via the first conduit from a location between the first outlet of the control valve and the inlet of the selector valve.
