(57) **ABSTRACT**

Patrons at a restaurant or bar can pay at their table using credit cards, without involving the restaurant or bar cashier and/or wait staff. Patrons are assisted using this system in dividing the bill by displaying the amount due (including tax) and allowing each patron to enter the amount they wish to pay. When the initial bill is presented, a balance due will be displayed and the indication will be provided that the bill has yet to be paid in full. As each transaction is entered, a running total will be displayed indicating the remaining balance due. When the running total reaches zero, the bill is paid in full, and an indication will be provided, such as by illuminating a green indicator light or by displaying a balance due of \$0.00.

## PAY AT THE TABLE SYSTEM

**Matter enclosed in heavy brackets [ ] appears in the original patent but forms no part of this reissue specification; matter printed in italics indicates the additions made by reissue; a claim printed with strikethrough indicates that the claim was canceled, disclaimed, or held invalid by a prior post-patent action or proceeding.**

This application is a division of application Ser. No. 09/679,781, filed Oct. 5, 2000, status allowed.

## TECHNICAL FIELD

The present invention relates in general to information processing systems, and in particular, to a point-of-sale terminal permitting restaurant patrons to individually pay their portion of the restaurant bill.

## BACKGROUND INFORMATION

Many times has the following scenario been encountered. A group of patrons dining at a restaurant receive the bill, and then go through the complicated task of determining how much each patron owes on the bill, including applicable tax and an allotted portion of the gratuity to be paid to the wait staff. Moreover, many restaurants and bars do not accept separate payments for items on a single bill, mostly because splitting a bill often results in errors and in taking time away from the wait staff being able to serve other customers within the restaurant.

Thus, there is a need to address these competing interests, whereby the patrons are able to split a bill without such a process unduly burdening the wait staff, and adversely impacting the restaurant's efficiency.

U.S. Pat. No. 5,933,812 to Meyer, et al. provides a portable transaction terminal system which provides for complete data entry at the guest table of an eating and drinking establishment. The terminal has the facility for entering all the information needed to complete the transaction, including the server's gratuity. This portable transaction terminal system is nothing more than the credit card payment devices found at almost every commercial establishment, such as grocery stores, permitting a total bill to be paid using a patron's credit card. Meyer, et al. provides an additional functionality in permitting the patron to pay a gratuity in addition to the total bill. What Meyer, et al. does not disclose is an ability for the bill to be split among the various patrons at a table and for each of such patrons to individually pay their desired portion using a credit card.

## SUMMARY OF THE INVENTION

The foregoing need is addressed by the present invention which allows diners in a restaurant to pay at the table using credit cards, without involving the restaurant cashier and/or the wait staff. The present invention will assist patrons in dividing the bill by displaying the amount due (including tax) and allowing each patron to enter the amount which he or she wishes to pay. When the initial bill is presented, a balance due will be displayed and a red indicator light may be illuminated, indicating that the bill is not yet paid in full. As each transaction is entered, a running total will be displayed indicating the remaining balance due. When the running total reaches zero, the bill is paid in full (including

the tax, but not necessarily an optional gratuity). The present invention may indicate that the bill has been paid in full by illuminating a green indicator light and by displaying a balance due of \$0.00.

The foregoing has outlined rather broadly the features and technical advantages of the present invention in order that the detailed description of the invention that follows may be better understood. Additional features and advantages of the invention will be described hereinafter which form the subject of the claims of the invention.

## BRIEF DESCRIPTION OF THE DRAWINGS

For a more complete understanding of the present invention, and the advantages thereof, reference is now made to the following descriptions taken in conjunction with the accompanying drawings, in which:

FIG. 1 illustrates a network implementing the present invention;

FIG. 2 illustrates a point-of-sale terminal for allowing patrons to pay their portion of the bill using a credit;

FIG. 3 illustrates a block diagram of a data processing system configurable in accordance with the present invention;

FIG. 4 illustrates a flow diagram of one embodiment of the present invention;

FIG. 5 illustrates a flow diagram of an alternative embodiment of the present invention;

FIG. 6 illustrates an alternative point-of-sale terminal for permitting patrons to pay their portion of the bill using a credit card at a touch-sensitive display screen; and

FIG. 7 illustrates a flow diagram of another alternative embodiment of the present invention.

## DETAILED DESCRIPTION

In the following description, numerous specific details are set forth such as specific point of sale terminal configurations, etc. to provide a thorough understanding of the present invention. However, it will be obvious to those skilled in the art that the present invention may be practiced without such specific details. In other instances, well-known circuits have been shown in block diagram form in order not to obscure the present invention in unnecessary detail. For the most part, details concerning timing considerations and the like have been omitted in as much as such details are not necessary to obtain a complete understanding of the present invention and are within the skills of persons of ordinary skill in the relevant art.

Refer now to the drawings wherein depicted elements are not necessarily shown to scale and wherein like or similar elements are designated by the same reference numeral through the several views.

The following exemplified scenario is addressed to the use of the present invention. A group of patrons are dining at a restaurant, where each of the patrons orders various items, which are placed on a single bill by the wait staff. The total bill is then presented to the table of patrons, who decide that they wish to split the bill and pay on a separate basis. The present invention has the advantage of permitting this process of paying separately without unduly burdening the restaurant wait staff.

Note, though the present invention is described with respect to a restaurant, it is applicable to any situation where a plurality of patrons wish to pay separate portions of a bill.

Referring to FIG. 1, in today's typical restaurant environment, the old fashioned cash register has been replaced

by a computer server **101**, which is coupled to a waiter's or cashier's terminal **102** where orders from various patrons at tables are entered into the system on a per table basis. The server **101** keeps track of such orders, and may provide various other functionalities not pertinent to the present invention, such as being linked to a software accounting system. As a waiter receives orders for items of food and beverages from patrons at a particular table, the waiter will input such items at the waiter's terminal **102**, which then keeps track of a running total bill for each table within the restaurant establishment. For example, once the patrons at a particular table have completed their main course, the waiter will ask the patrons if they wish to now order desert and/or coffee. If any orders of desert and/or coffee are made by any of the patrons, the waiter will enter such orders at the waiter's terminal **102**, and such items will be added to the total bill for that table.

The typical method for presenting the total bill for patrons at a table is for the waiter to print out the total bill at the waiter's terminal **102** and present the paper invoice to the patrons at the table. The reason there is typically a single bill presented to the patrons is that most restaurants do not permit separate checks to be issued to the various patrons at a table since this not only complicates an already complicated job for the waiter, but can also result in more errors being made by the waiter in keeping track of each of the patron's individual orders, and slows down each waiter's efficiency in being able to provide personal service to each of their respective tables. These inefficiencies can further result in human errors being made by the wait staff in bringing incorrect meal orders to the patrons at their tables, and can also slow down the throughput of patrons through the restaurant where it takes longer for a table of patrons to be served and the payment transaction to be completed so that the table can be cleared for the next group of patrons.

Though U.S. Pat. No. 5,933,812 to Meyer, et al. discussed previously provides for an entire table of patrons to pay the total bill using a credit card, including the gratuity, it does not provide an ability for the check to be split among the various patrons, and for those individual patrons to then pay their desired portion of the bill. This deficiency is addressed by the present invention.

Again referring to FIG. 1, the present invention provides a table unit **103**, which is either brought by the waiter to the table with the presentation of the total bill, or is permanently resident at the table. Nevertheless, the table unit **103** is in communication with the waiter's terminal **102** and the server **101** so that the total bill can be displayed to the patrons at the table and for permitting the patrons to individually pay what they desire their portion of the bill to be.

Referring to FIG. 2, there is illustrated one example of such a table unit **103**, which includes a credit card reader **201** through which a credit card (not shown) can be slid through for reading the account information on the magnetic strip of the credit card, in a manner that is well known in the art. Table unit **103** also includes a display **202**, which will display information pertaining to the food bill for the table of patrons, in a manner as further described below. Also illustrated in FIG. 2 are green light **203**, red light **204**, and yellow light **205**, which are also further discussed below.

As discussed previously, a waiter serving a particular table of patrons will enter in each item ordered by the patrons at the table at the waiter's terminal **102**. The system illustrated in FIG. 1 will keep track of the itemized list of items ordered by the table of patrons, including a running subtotal indicating the total amount owed by the table of patrons for the items they ordered. Referring to FIG. 4, step

**401** shows that on a per table basis, such a subtotal amount of items purchased is maintained at the waiter's terminal **102**. When the waiter for the table of patrons has determined that the patrons are no longer going to order any further items, then the waiter can provide some type of input at the waiter's terminal **102** that the final order has been entered (step **402**). In step **403**, the system will compute the total bill for the table of patrons, compute any applicable tax to be charged along with the total bill, and can optionally compute suggested gratuities to be paid by the patrons at the table for various suggested percentages. For example, gratuities can be calculated based on a 15% factor, a 20% factor, etc. In step **404**, the computed totals are then transmitted from the waiter's terminal **102** to the table unit **103** for display to the patrons on display **202** on unit **103**. As an example, a total food bill of \$123.45, along with the applicable tax for the bill of \$9.88 with a resulting subtotal of \$133.33 may be displayed on display **202**. Furthermore, the suggested gratuities of 15% (\$18.52) and 20% (\$24.69) may also be displayed on display **202**.

Next, in step **405**, an indication can be provided to either the waiter at waiter's terminal **102** or the patrons at table unit **103** that the bill has yet to be paid in full by the patrons. One example of such an indication would be the illumination of an LED light **204** on unit **103**. Another indication might be merely some wording displayed on display **202** stating that the bill has yet to be paid in full. This indication also provides the same type of information to the wait staff as to whether the patrons have completed the payment transaction. Next, in step **406**, a request is made to the patrons to add their desired gratuity submission to the subtotal of the bill plus the tax. Such a request can be performed in the manner of a message displayed on display **202**. The patrons can then enter in any amount of gratuity they wish, including selecting one of the suggested gratuity amounts. The entry of such an amount can be performed using numerical key pad **206**. Alternatively, display screen **202** may be a touch-sensitive screen, which are well known in the art. The result is that a grand total of food, tax, and gratuity will then be displayed for payment by the patrons. In step **407**, the system determines whether the gratuity has been added. If not, the process merely returns to step **406**. However, if the gratuity has been then added by the patrons, the process proceeds to step **408** to determine whether one of the patrons has entered a credit card number. This can be performed by a patron swiping their credit card (not shown) through credit card reader **201**, or an option can be implemented whereby the credit card number of a patron is entered using the input keypad **206**. The system will merely loop upon itself if a credit card number has yet to be entered. Note, while the system merely loops upon itself waiting for a patron to enter a credit card number or to swipe their credit card through credit card reader **201**, the indication provided in step **405** visually remains. For example, the red light **204** will remain illuminated. In step **409**, if a patron has swiped their credit card through credit card reader **201**, the system, in step **409**, will request the holder of that credit card to enter an amount they wish to pay using that credit card number. Such a request can be displayed to the patron using display **202**. The patron associated with that credit card number can then enter in an amount they are paying on that credit card using the input keypad **206**. In step **410**, the system will deduct the amount entered by the patron from the grand total bill, and determine if the amount entered by the patron results in a payment of the entire bill or merely a portion thereof. If the amount entered by the patron associated with the credit card swiped through credit card reader **201** is less than the total

5

bill, then in step **413**, the remaining balance still owed by the table of patrons will be displayed on display **202**. The system will then wait for another credit card number to be entered in step **408**. Theoretically, such a credit card number can be the same credit card number as entered previously where the same patron decides that they are going to pay the next portion of the balance. However, what the first portion of the invention is designed for is to enable another one of the patrons within the group at the table to then enter in their own credit card by swiping it through credit card reader **201** and then enter in an amount they wish to pay on the remaining balance in step **409**. Again, in step **410**, this new amount entered by the subsequent patron is then subtracted from the remaining balance to determine if the total bill has now been paid at the table. If a balance still remains, the process continues through steps **413**, **408**, **409** and **410** and so on until the total bill is paid of the food, tax, and selected gratuity. Once the total bill is computed to have been paid by the group of patrons at the table, in step **411**, an indication will be provided that the bill has now been paid in full. This may be shown by the discontinuance of the illumination of the red lamp **204**, and the illumination of a green lamp **203** on the unit **103**. Furthermore, some other type of indication may be provided at the waiter's terminal **102** to indicate that the patrons have now paid the bill in full. Thereafter, in step **412**, the payment information entered by each of the patrons with respect to their credit card numbers and accounts, will then be transmitted by the establishment from server **101** over a network to the various financial institutions associated with the credit card accounts of the patrons.

Referring to FIG. **5**, there is illustrated an alternative embodiment of the present invention, which can be used to replace steps **405-413** in FIG. **4**. Essentially, these steps may be implemented to permit each of the patrons to pay a portion of the total food bill plus tax, but not the gratuity. From step **404**, the process will proceed to step **501** to provide an indication that the bill has yet to be paid in full. This step may be performed in a manner similarly as discussed above with respect to step **405**. Thereafter, steps **502-505** can be implemented in a manner as similarly described above with respect to steps **408-410** and **413** whereby each of the patrons at the table pays their desired portion of the food bill plus tax portion. Once that total portion has been paid in full the process will then proceed to step **506** to indicate that the total bill has been paid, but that a gratuity has yet to be added. This indication can be implemented using a displayed message or by illuminating a yellow lamp **205** on unit **103**. Thereafter, the patrons can then decide what amount of gratuity they wish to pay to the wait staff, which can be performed using cash collected from each of the patrons to be deposited on the table, or by repeating the process described above with respect to steps **502-505** for a gratuity amount to be selected and agreed upon by the patrons.

Referring to FIG. **6**, there is illustrated an alternative embodiment of the present invention whereby a table unit **601** is implemented with a touch-sensitive display screen **603**, and a credit card reader **602**. The credit card reader **602** functions in a manner as similarly described above with respect to the credit card reader **201** in unit **103**. However, the display **202** and the key input pad **206** are replaced by the touch-sensitive display screen **603**. The touch-sensitive screen **603** operates in a manner well known in the art whereby a user can touch various items displayed on the screen for selection of those items. What table unit **601** enables the system to do is to list every item ordered by the table of patrons on touch-sensitive display screen **603**,

6

whereby each of the patrons can then select the items they wish to pay for, and enter a gratuity they wish to pay for on each of their individual credit cards.

Referring to FIG. **7**, in step **701**, on a per table basis, a subtotal amount is calculated for the items ordered and purchased by a table of patrons. Steps **702** and **703** are then performed in a manner as similarly described above with respect to steps **402** and **403**. Thereafter, in step **704**, the list of items ordered by the patrons at the table and their respective costs are then displayed on touch-sensitive display **603**. Additionally, the subtotal for the food items will be displayed along with any applicable tax, resulting in a total displayed for the food and tax. Additionally, suggested gratuity amounts may also be displayed. An example of such a display of information is illustrated in FIG. **6**. Thereafter, in step **705**, an indication will be provided that the bill has yet to be paid in full. FIG. **6** does not illustrate the red, green and yellow lamps as shown in FIG. **2**, but these can be implemented on unit **601** as well. In step **706**, the system loops until a credit card number has been entered by a patron, either using the touch-sensitive screen **603** to enter in digits on a displayed virtual numeric keypad (not shown), or by swiping a credit card through credit card reader **602**. Once a patron has entered a credit card number, the process proceeds to step **707** where a request is made of the credit card holder to select items the credit card holder wishes to pay for. Such a request can be made using a message displayed on display **603**. The credit card holder will then select items they wish to pay for using the touch-sensitive screen, in a manner well known in the art. For example, referring to the exemplary list of items shown in FIG. **6**, this credit card holder could select to pay for the #1 Plate and for the Coffee by touching those items on the touch-sensitive screen **603**. In step **708**, as each item is selected by the credit card holder, a subtotal of such items is maintained, and will be displayed to the credit card holder in response to some type of action, such as pressing a virtual ENTER button on display **603**. Along with the subtotal of items selected by the credit card holder, the system will also compute and display the tax associated with such items, and may also compute suggested gratuity amounts for the credit card holder. For example, for the subtotal of items and tax selected by the first credit card holder, suggested 15% and 20% gratuity amounts can also be displayed for selection by the credit card holder. In step **709**, the holder of the credit card will then be requested to confirm their computed subtotal plus tax, and to select one of the suggested gratuity amounts, or to enter a different gratuity amount using the virtual numeric key pad, which can also be displayed. In step **710**, the grand total for that particular credit card holder will then be computed and displayed, and in step **711**, that amount will be subtracted from the total amount of the bill to determine if the total amount of the bill has now been paid. If not, in step **714**, the remaining balance will be displayed and the process will return to step **706** to repeat steps **706-711** until the entire total bill for the food and tax have been paid by the patrons responsible for this bill. Once the total bill has been paid, the process will proceed from step **711** to step **712** to indicate that the bill has been paid in full, and the payment information for the various credit card holders who entered their information will be transmitted to the respective financial institutions in step **713**.

The various units illustrated in FIG. **1** can each be implemented using a typical data processing system, such as the one illustrated in FIG. **3**.

Referring first to FIG. **3**, an example is shown of a data processing system **300** which may be used for the invention.

The system has a central processing unit (CPU) 310, which is coupled to various other components by system bus 312. Read only memory ("ROM") 316 is coupled to the system bus 312 and includes a basic input/output system ("BIOS") that controls certain basic functions of the data processing system 300. Random access memory ("RAM") 314, I/O adapter 318, and communications adapter 334 are also coupled to the system bus 312. I/O adapter 318 may be a small computer system interface ("SCSI") adapter that communicates with a disk storage device 320. Communications adapter 334 interconnects bus 312 with an outside network enabling the data processing system to communicate with other such systems. Input/Output devices are also connected to system bus 312 via user interface adapter 322 and display adapter 336. Keyboard 324 and mouse 326 are all interconnected to bus 312 via user interface adapter 322. Display monitor 338 is connected to system bus 312 by display adapter 336. In this manner, a user is capable of inputting to the system throughout the keyboard 324 or mouse 326 and receiving output from the system display 338.

Preferred implementations of the invention include implementations as a computer system programmed to execute the method or methods described herein, and as a computer program product. According to the computer system implementation, sets of instructions for executing the method or methods are resident in the random access memory 314 of one or more computer systems configured generally as described above. Until required by the computer system, the set of instructions may be stored as a computer program product in another computer memory, for example, in disk drive 320 (which may include a removable memory such as an optical disk or floppy disk for eventual use in the disk drive 320). Further, the computer program product can also be stored at another computer and transmitted when desired to the user's work station by a network or by an external network such as the Internet. One skilled in the art would appreciate that the physical storage of the sets of instructions physically changes the medium upon which it is stored so that the medium carries computer readable information. The change may be electrical, magnetic, chemical, biological or some other physical change. While it is convenient to describe the invention in terms of instructions, symbols, characters, or the like, the reader should remember that all of these and similar terms should be associated with the appropriate physical elements.

Note that the invention may describe terms such as comparing, validating selecting, identifying, or other terms that could be associated with a human operator. However, for at least a number of the operations described herein which form part of at least one of the embodiments, no action by a human operator is desirable. The operations described are, in large part, machine operations processing electrical signals to generate other electrical signals.

Although the present invention and its advantages have been described in detail, it should be understood that various changes, substitutions and alterations can be made herein without departing from the spirit and scope of the invention as defined by the appended claims.

What is claimed is:

1. A *non-transitory* computer program product operable for implementing a method for payment of a bill, the computer program product comprising: [a] *non-transitory* memory readable by a data processing system, the memory storing program code comprising the program steps of:

a) calculating a total bill for a plurality of patrons at a table;

- b) causing a display, on a display of a table unit device physically located at the table configured to enable patrons seated at the table to manually enter an electronic payment, of the total bill to the plurality of patrons at the table *along with the items and a cost associated with each of the items of the total bill*;
- c) responsive to providing physical access at the table to the table unit device to a first one of the plurality of patrons, receiving manual input information at the table unit device directly from the first one of the plurality of patrons on the table unit device at the table to pay a first portion of the total bill using a first credit card account;
- d) automatically calculating, in response to receiving the input information directly from the first one of the plurality of patrons, a first balance owed equal to the total bill minus the first portion;
- e) [automatically] causing the display, on the display of the table unit device, [in response to] *after* automatically calculating the balance owed, to display the balance owed to the plurality of patrons, saving the balance owed as a balance owed on the total bill;
- f) responsive to providing physical access at the table to the table unit device to a second of the plurality of patrons, receiving manual input information on the table unit device at the table directly from the second of the plurality of patrons on the table unit device at the table to pay a second portion of the total bill using a second credit card account;
- g) automatically calculating, in response to receiving the input information directly from the second one of the plurality of patrons, a balance owed equal to the balance owed on the total bill minus the second portion, and retaining this balance owed as second balance owed on the total bill, the second balance equaling a total amount owed by the plurality of patrons;
- h) [automatically] causing the display, on the display of the table unit device at the table, [in response to] *after* automatically calculating the balance owed, to display the second balance owed to the plurality of patrons; [and]
- i) repeating steps f) through h) until the total amount owed equals zero; *and*
- j) *causing a visual indication to the plurality of patrons that the total bill has been paid, wherein the total bill represents a total amount of money owed by the plurality of patrons for items selected for purchase by the plurality of patrons, wherein step b) further comprises the step of: requesting a selection of which of the items on the total bill is to be included in the first portion, wherein step c) further comprises the step of: receiving an input from the first one of the plurality of patrons of which of the items on the total bill is to be included in the first portion, wherein step d) further comprises the step of: calculating a first subtotal corresponding to the first balance owed and the applicable tax, and calculating a suggested gratuity associated with the first subtotal, and wherein the display is configured to receive a selection or entry of a gratuity.*

[2. The computer program product as recited in claim 1, wherein the total bill represents a total amount of money owed by the plurality of patrons for items selected for purchase by the plurality of patrons.]

3. The computer program product as recited in claim 1, wherein program step c) comprises the program steps of:

receiving credit card account information associated with the first credit card account; and receiving the first portion manually inputted by the first one of the plurality of patrons, and wherein the step f) comprises the steps of:

receiving credit card account information associated with the second credit card account; and receiving the second portion manually inputted by the second of the plurality of patrons.

4. The computer program product as recited in claim 3, wherein the receipt of credit card information further comprises the step of reading of a magnetic strip on the credit card when it is swiped through a credit card reader.

5. The computer program product as recited in claim 3, further comprising the step of:

initiating a transmitting of the manually input information received in program steps c) and f) to one or more financial institutions.

6. The computer program product as recited in claim 3, further comprising the steps of:

requesting the first one of the plurality of patrons to include a first gratuity amount with the first manually input information, wherein the first portion includes the first gratuity amount; and

requesting the second of the plurality of patrons to include a second gratuity amount with the second input information, wherein the second portion includes the second gratuity amount.

7. The computer program product as recited in claim 6, further comprising the step of:

requesting the plurality of patrons add an amount of gratuity to the total bill before step c) is performed.

8. The computer program product as recited in claim 7, wherein the first and second gratuity amounts equal to the amount of gratuity added to the total bill.

9. The computer program product as recited in claim 3, wherein the total bill includes a gratuity selected by the plurality of patrons.

10. The computer program product as recited in claim 3, further comprising the step of:

causing a visual indication to the plurality of patrons that the total bill has not yet been paid when the balance owed is greater than zero.

[11. The computer program product as recited in claim 10, further comprising the step of:

causing a visual indication to the plurality of patrons that the total bill has been paid when the balance owed is equal to zero.]

12. The computer program product as recited in claim 7, wherein the step of requesting the plurality of patrons adds the amount of gratuity to the total bill before program step c) is performed comprises the step of:

causing a display, on the display device at the table, to the plurality of patrons of one or more suggested gratuity amounts.

[13. The computer program product as recited in claim 2, wherein step b) comprises:

causing a display, on the display device at the table, of the items and a cost associated with each of the items on the display device; and

wherein step c) further comprises the step of: receiving an input from the first one of the plurality of patrons of which of the items on the total bill is to be included in the first portion.]

14. A non-transitory computer program product operable for implementing a method for payment of a bill, the computer program product comprising: non-transitory

memory readable by a data processing system, the memory storing program code comprising the program steps of:

a) calculating a total bill for a plurality of patrons at a table;

b) causing a display, on a display of a table unit device physically located at the table configured to enable patrons seated at the table to manually enter an electronic payment, of the total bill to the plurality of patrons at the table;

c) responsive to providing physical access at the table to the table unit device to a first one of the plurality of patrons, receiving manual input information at the table unit device directly from the first one of the plurality of patrons on the table unit device at the table to pay a first portion of the total bill using a first credit card account;

d) automatically calculating, in response to receiving the input information directly from the first one of the plurality of patrons, a first balance owed equal to the total bill minus the first portion;

e) causing the display, on the display of the table unit device, after automatically calculating the balance owed, to display the balance owed to the plurality of patrons, saving the balance owed as a balance owed on the total bill;

f) responsive to providing physical access at the table to the table unit device to a second of the plurality of patrons, receiving manual input information on the table unit device at the table directly from the second of the plurality of patrons on the table unit device at the table to pay a second portion of the total bill using a second credit card account;

g) automatically calculating, in response to receiving the input information directly from the second one of the plurality of patrons, a balance owed equal to the balance owed on the total bill minus the second portion, and retaining this balance owed as second balance owed on the total bill, the second balance equaling a total amount owed by the plurality of patrons;

h) causing the display, on the display of the table unit device at the table, after automatically calculating the balance owed, to display the second balance owed to the plurality of patrons,

wherein the total bill represents a total amount of money owed by the plurality of patrons for items selected for purchase by the plurality of patrons, wherein step b) further comprises the step of:

requesting a selection of which of the items on the total bill is to be included in the first portion,

wherein step c) further comprises the step of: receiving an input from the first one of the plurality of patrons of which of the items on the total bill is to be included in the first portion,

wherein step d) further comprises the step of: calculating a first subtotal corresponding to the first balance owed and the applicable tax, and calculating a suggested gratuity associated with the first subtotal, and

wherein the display is configured to receive a selection or entry of a gratuity.

15. The computer program product as recited in claim 14, further comprising the step of repeating steps f) through h) until the total amount equals zero.

16. The computer program product as recited in claim 14, wherein program step c) comprises the program steps of: receiving credit card account information associated with the first credit card account; and

## 11

receiving the first portion manually inputted by the first one of the plurality of patrons, and wherein the step f) comprises the steps of:

receiving credit card account information associated with the second credit card account; and receiving the second portion manually inputted by the second of the plurality of patrons.

17. The computer program product as recited in claim 16, wherein the receipt of credit card information further comprises the step of reading of a magnetic strip on the credit card when it is swiped through a credit card reader.

18. The computer program product as recited in claim 16, further comprising the step of:

initiating a transmitting of the manually input information received in program steps c) and f) to one or more financial institutions.

19. The computer program product as recited in claim 16, further comprising the steps of:

requesting the first one of the plurality of patrons to include a first gratuity amount with the first manually input information, wherein the first portion includes the first gratuity amount; and

requesting the second of the plurality of patrons to include a second gratuity amount with the second input information, wherein the second portion includes the second gratuity amount.

20. The computer program product as recited in claim 19, further comprising the step of:

requesting the plurality of patrons add an amount of gratuity to the total bill before step c) is performed.

21. The computer program product as recited in claim 20, wherein the first and second gratuity amounts equal to the amount of gratuity added to the total bill.

22. The computer program product as recited in claim 16, wherein the total bill includes a gratuity selected by the plurality of patrons.

23. The computer program product as recited in claim 16, further comprising the step of:

causing a visual indication to the plurality of patrons that the total bill has not yet been paid when the balance owed is greater than zero.

24. The computer program product as recited in claim 23, further comprising the step of:

causing a visual indication to the plurality of patrons that the total bill has been paid when the balance owed is equal to zero.

25. The computer program product as recited in claim 20, wherein the step of requesting the plurality of patrons adds the amount of gratuity to the total bill before program step c) is performed comprises the step of:

causing a display, on the display device at the table, to the plurality of patrons of one or more suggested gratuity amounts.

26. The computer program product as recited in claim 14, wherein step b) further comprises:

causing a display, on the display device at the table, of the items and a cost associated with each of the items on the display device.

27. A non-transitory computer program product operable for implementing a method for payment of a bill, the computer program product comprising:

non-transitory memory readable by a data processing system, the memory storing program code comprising the program steps of:

a) calculating a total bill for a plurality of patrons at a table;

## 12

b) causing a display, on a display of a table unit device physically located at the table configured to enable patrons seated at the table to manually enter an electronic payment, of the total bill to the plurality of patrons at the table;

c) responsive to providing physical access at the table to the table unit device to a first one of the plurality of patrons, receiving manual input information at the table unit device directly from the first one of the plurality of patrons on the table unit device at the table to pay a first portion of the total bill using a first credit card account;

d) automatically calculating, in response to receiving the input information directly from the first one of the plurality of patrons, a first balance owed equal to the total bill minus the first portion;

e) automatically causing the display, on the display of the table unit device, in response to automatically calculating the balance owed, to display the balance owed to the plurality of patrons, saving the balance owed as a balance owed on the total bill;

f) responsive to providing physical access at the table to the table unit device to a second of the plurality of patrons, receiving manual input information on the table unit device at the table directly from the second of the plurality of patrons on the table unit device at the table to pay a second portion of the total bill using a second credit card account;

g) automatically calculating, in response to receiving the input information directly from the second one of the plurality of patrons, a balance owed equal to the balance owed on the total bill minus the second portion, and retaining this balance owed as second balance owed on the total bill, the second balance equaling a total amount owed by the plurality of patrons;

h) automatically causing the display, on the display of the table unit device at the table, in response to automatically calculating the balance owed, to display the second balance owed to the plurality of patrons; and

i) repeating steps f) through h) until the total amount owed equals zero,

wherein the total bill represents a total amount of money owed by the plurality of patrons for items selected for purchase by the plurality of patrons, wherein step b) further comprises the step of:

requesting a selection of which of the items on the total bill is to be included in the first portion, wherein step c) further comprises the step of:

receiving an input from the first one of the plurality of patrons of which of the items on the total bill is to be included in the first portion, wherein step d) further comprises the step of:

calculating a first subtotal corresponding to the first balance owed and the applicable tax, and calculating a suggested gratuity associated with the first subtotal, and

wherein the display is configured to receive a selection or entry of a gratuity.

28. The computer program product as recited in claim 27, wherein program step c) comprises the program steps of:

receiving credit card account information associated with the first credit card account; and

receiving the first portion manually inputted by the first one of the plurality of patrons, and wherein the step f) comprises the steps of:

13

receiving credit card account information associated with the second credit card account; and receiving the second portion manually inputted by the second of the plurality of patrons.

29. The computer program product as recited in claim 28, wherein the receipt of credit card information further comprises the step of reading of a magnetic strip on the credit card when it is swiped through a credit card reader.

30. The computer program product as recited in claim 28, further comprising the step of:

initiating a transmitting of the manually input information received in program steps c) and f) to one or more financial institutions.

31. The computer program product as recited in claim 28, further comprising the steps of:

requesting the first one of the plurality of patrons to include a first gratuity amount with the first manually input information, wherein the first portion includes the first gratuity amount; and

requesting the second of the plurality of patrons to include a second gratuity amount with the second input information, wherein the second portion includes the second gratuity amount.

32. The computer program product as recited in claim 31, further comprising the step of:

requesting the plurality of patrons add an amount of gratuity to the total bill before step c) is performed.

14

33. The computer program product as recited in claim 32, wherein the first and second gratuity amounts equal to the amount of gratuity added to the total bill.

34. The computer program product as recited in claim 28, wherein the total bill includes a gratuity selected by the plurality of patrons.

35. The computer program product as recited in claim 28, further comprising the step of:

causing a visual indication to the plurality of patrons that the total bill has not yet been paid when the balance owed is greater than zero.

36. The computer program product as recited in claim 35, further comprising the step of:

causing a visual indication to the plurality of patrons that the total bill has been paid when the balance owed is equal to zero.

37. The computer program product as recited in claim 32, wherein the step of requesting the plurality of patrons adds the amount of gratuity to the total bill before program step c) is performed comprises the step of:

causing a display, on the display device at the table, to the plurality of patrons of one or more suggested gratuity amounts.

38. The computer program product as recited in claim 27, wherein step b) further comprises:

causing a display, on the display device at the table, of the items and a cost associated with each of the items on the display device.
