## TECHNICAL FIELD

The invention relates pyrazole derivatives and the use of these compounds for the treatment of various diseases and conditions.

## BACKGROUND OF THE INVENTION

Glutamate is one of the major excitatory neurotransmitters that is widely spread in the brain. First indication of its role as an excitatory messenger was in the 1950's when it was observed that intravenous administration of glutamate induces convulsions. However, the detection of the whole glutamatergic neurotransmitter system with its various receptors did not take place before the 1970's and 1980's when numerous antagonists were developed or, as in the case of PCP and ketamine, were identified as antagonists. Finally, in the 1990's molecular biology provided the tools for the classification of the glutamatergic receptors.

Glutamate is a main excitatory neurotransmitter in the mammalian central nervous system and N-methyl-D-aspartate (NMDA) receptors are a subtype of ionotropic glutamate receptors that mediate excitatory synaptic transmission in the brain. NMDA receptors are ubiquitously distributed throughout the brain and play a key role in synaptic plasticity, synaptogenesis, excitotoxicity, memory acquisition and learning. NMDA receptors are distinct from other major subtypes of ionotropic glutamate receptors (AMPA and kainate receptors) in that they are blocked by  $Mg^{2+}$  at resting membrane potentials, are highly  $Ca^{2+}$  permeable, and require co-activation by two distinct neurotransmitters: glutamate and glycine (or D-serine) (Traynelis S F et al., *Pharmacol Rev.* 2010; 62(3):405-96). The influx of  $Ca^{2+}$  through NMDA receptors triggers signaling cascades and regulates gene expression that is critical for different forms of synaptic plasticity including both long-term potentiation of synapse efficacy (LTP) (Berberich S et al., *Neuropharmacology* 2007; 52(1):77-86) and long-term depression (LTD) (Massey, P V et al., *J Neurosci.* 2004 8; 24(36):7821-8).

The vast majority of the mammalian NMDA receptors form a heterotetramer made of two obligatory GluN1 units and two variable GluN2 receptor subunits encoded by the GRIN1 gene and one of four GRIN2 genes, respectively. One or both GluN2 subunits can be potentially replaced by a GluN3A or a GluN3B subunit. The GRIN1 gene product has 8 splice variants while there are 4 different GRIN2 genes (GRIN2A-D) encoding four distinct GluN2 subunits. The

glycine binding site is present on the GluN1 subunit and the glutamate binding site is present on the GluN2 subunit.

The GluNR2 subunits play a dominant role in determining the functional and pharmacological properties of the NMDA receptor assembly and exhibit distinct distribution in different areas of the brain. For instance, GluN2B subunits are expressed primarily in the forebrain in the adult mammalian brain (Paoletti P et al., *Nat Rev Neurosci.* 2013; 14(6):383-400; Watanabe Metal., *J Comp Neurol.* 1993; 338(3):377-90) and are implicated in learning, memory processing, mood, attention, emotion and pain perception (Cull-Candy S et al., *Curr Opin Neurbiol.* 2001; 11(3):327-35).

Compounds that modulate GluN2B-containing NMDA receptor function can be useful in treatment of many neurological and psychiatric disorders including but not limited to bipolar disorder, major depressive disorder (Miller O H et al., *eLife.* 2014; 3:e03581; Li N et al., *Biol Psychiatry* 2011; 69(8):754-61), treatment-resistant depression (Preskorn S H et al. *J Clin Psychopharmacol.* 2008; 28(6):631-7) and other mood disorders (e.g., postpartum depression, seasonal affective disorder and the like), Alzheimer's disease (Hanson J E et al., *Neurobiol Dis.* 2015; 74:254-62; Li S et al., *J Neurosci.* 2011; 31(18):6627-38), Parkinson's disease (Duty S, *CNS Drugs.* 2012; 26(12):1017-32; Steece-Collier K et al., *Exp Neurol.* 2000; 163(1):239-43; Leaver K R et al. *Clin Exp Pharmacol Physiol.* 2008; 35(11):1388-94), Huntington's chorea (Tang T S et al., *Proc Natl Acad Sci USA.* 2005; 102(7):2602-7; Li L et al., *J Neurphysiol.* 2004; 92(5):2738-46), multiple sclerosis (Grasselli G et al., *Br J Pharmacol.* 2013; 168(2):502-17; Farjam M et al., *Iran J Pharm Res.* 2014; 13(2):695-705), cognitive impairment (Wang D et al. 2014, *Expert Opin Ther Targets Expert Opin Ther Targets.* 2014; 18(10):1121-30), head injury (Bullock M R et al., *Ann N Y Acad Sci.* 1999; 890:51-8), spinal cord injury, stroke (Yang Y et al., *J Neurosurg.* 2003; 98(2):397-403), epilepsy (Naspolini A P et al., *Epilepsy Res.* 2012 June; 100(1-2):12-9), movement disorders (e.g. dyskinesias) (Morissette M et al., *Mov Disord* 2006; 21(1):9-17), various neurodegenerative diseases (e.g. amyotrophic lateral sclerosis (Fuller P I et al., *Neurosci Lett.* 2006; 399(1-2):157-61) or neurodegeneration associated with bacterial or chronic infections), pain (e.g. chronic, cancer, post-operative and neuropathic pain (Wu L J and Zhuo M, *Neurotherapeutics.* 2009; 6(4):693-702), diabetic neuropathy, migraine (Peeters M et al., *J Pharmacol Exp Ther* 2007; 321(2):564-72), cerebral ischemia (Yuan H et al., *Neuron.* 2015; 85(6):1305-18), schizophrenia (Grimwood S et al., *Neuroreport.* 1999; 10(3):461-5), encephalitis (Dalmau J. et al. *Lancet Neurol.* 2008; 7(12):1091-8), autism and autism spectrum disorders (Won H. et al., *Nature.* 2012; 486(7402):261-5), memory and learning disorders (Tang, Y. “Pharmaceutically acceptable vehicle” refers to a diluent, adjuvant, excipient or carrier with which a compound of the invention is administered. A “pharmaceutically acceptable excipient” refers to a substance that is non-toxic, biologically tolerable, and otherwise biologically suitable for administration to a subject, such as an inert substance, added to a pharmacological composition or otherwise used as a vehicle, carrier, or diluent to facilitate administration of an agent and that is compatible therewith. Examples of excipients include calcium carbonate, calcium phosphate, various sugars and types of starch, cellulose derivatives, gelatin, vegetable oils, and polyethylene glycols.

“Subject” includes humans. The terms “human,” “patient,” and “subject” are used interchangeably herein.

“Treating” or “treatment” of any disease or disorder refers, in one embodiment, to ameliorating the disease or disorder (i.e., arresting or reducing the development of the disease or at least one of the clinical symptoms thereof). In another embodiment “treating” or “treatment” refers to ameliorating at least one physical parameter, which may not be discernible by the subject. In yet another embodiment, “treating” or “treatment” refers to modulating the disease or disorder, either physically, (e.g., stabilization of a discernible symptom), physiologically, (e.g., stabilization of a physical parameter), or both. In yet another embodiment, “treating” or “treatment” refers to delaying the onset of the disease or disorder.

In treatment methods according to the invention, a therapeutically effective amount of a pharmaceutical agent according to the invention is administered to a subject suffering from or diagnosed as having such a disease, disorder, or condition. A “therapeutically effective amount” means an amount or dose sufficient to generally bring about the desired therapeutic or prophylactic benefit in patients in need of such treatment for the designated disease, disorder, or condition. Effective amounts or doses of the compounds of the present invention may be ascertained by routine methods such as modeling, dose escalation studies or clinical trials, and by taking into consideration routine factors, e.g., the mode or route of administration or drug delivery, the pharmacokinetics of the compound, the severity and course of the disease, disorder, or condition, the subject’s previous or ongoing therapy, the subject’s health status and response to drugs, and the judgment of the treating physician. An example of a dose is in the range of from about 0.001 to about 200 mg of compound per kg of subject’s body weight per day, preferably about 0.05 to 100 mg/kg/day, or about 1 to 35 mg/kg/day, in single or divided dosage units (e.g., BID, TID, QID). For a 70-kg human, an illustrative range for a suitable dosage amount is from about 0.05 to about 7 g/day, or about 0.2 to about 2.5 g/day.

“Compounds of the present invention,” “compounds of the invention” and equivalent expressions, are meant to embrace compounds of the Formula (I) as described herein, which expression includes the pharmaceutically acceptable salts, polymorphs, N-oxides, and the solvates, e.g., hydrates, where the context so permits. Similarly, reference to intermediates, whether or not they themselves are claimed, is meant to embrace their salts, and solvates, where the context so permits.

Furthermore, in the case of the compounds of the invention which contain an asymmetric carbon atom, the invention relates to the D form, the L form and D, L mixtures and also, where more than one asymmetric carbon atom is present, to the diastereomeric forms. Those compounds of

the invention which contain asymmetric carbon atoms, and which as a rule accrue as racemates, can be separated into the optically active isomers in a known manner, for example using an optically active acid. However, it is also possible to use an optically active starting substance from the outset, with a corresponding optically active or diastereomeric compound then being obtained as the end product.

Compounds of the invention also include tautomeric forms. Tautomeric forms result from the swapping of a single bond with an adjacent double bond together with the concomitant migration of a proton. Tautomeric forms include prototropic tautomers which are isomeric protonation states having the same empirical formula and total charge. Exemplary prototropic tautomers include ketone—enol pairs, amide—imidic acid pairs, lactam—lactim pairs, amide—imidic acid pairs, enamine—imine pairs, and annular forms where a proton can occupy two or more positions of a heterocyclic system, for example, 1H- and 3H-imidazole, 1H-, 2H- and 4H-1,2,4-triazole, 1H- and 2H-isoindole, and 1H- and 2H-pyrazole. Tautomeric forms can be in equilibrium or sterically locked into one form by appropriate substitution.

Compounds of the invention can also include all isotopes of atoms occurring in the intermediates or final compounds. Isotopes include those atoms having the same atomic number but different mass numbers. For example, isotopes of hydrogen include tritium and deuterium.

Also included are solvates and hydrates of the compounds of Formula (I) and solvates, polymorphs, N-oxides, and hydrates of their pharmaceutically acceptable salts.

The term “compound” as used herein is meant to include all stereoisomers, geometric isomers, tautomers, and isotopes of the structures depicted, unless otherwise indicated.

As used herein, the term “isotopic variant” refers to a compound that contains unnatural proportions of isotopes at one or more of the atoms that constitute such compound. For example, an “isotopic variant” of a compound can be radiolabeled, that is, contain one or more non-radioactive or radioactive isotopes, such as for example, deuterium ( $^2\text{H}$  or D), carbon-13 ( $^{13}\text{C}$ ), nitrogen-15 ( $^{15}\text{N}$ ), or the like. It will be understood that, in a compound where such isotopic substitution is made, the following atoms, where present, may vary, so that for example, any hydrogen may be  $^2\text{H}/\text{D}$ , any carbon may be  $^{13}\text{C}$ , or any nitrogen may be  $^{15}\text{N}$ , and that the presence and placement of such atoms may be determined within the skill of the art. Likewise, the invention may include the preparation of isotopic variants with radioisotopes, in the instance for example, where the resulting compounds may be used for drug and/or substrate tissue distribution studies. Radiolabeled compounds of the invention can be used in diagnostic methods such as single-photon emission computed tomography (SPECT). The radioactive isotopes tritium, i.e.  $^3\text{H}$ , and carbon-14, i.e.  $^{14}\text{C}$ , are particularly useful for their ease of incorporation and ready means of detection. Further, compounds may be prepared that are substituted with positron emitting isotopes, such as  $^{11}\text{C}$ ,  $^{18}\text{F}$ ,  $^{15}\text{O}$  and  $^{13}\text{N}$ , and would be useful in positron emission topography (PET) studies for examining substrate receptor occupancy.

All isotopic variants of the compounds of the invention, radioactive or not, are intended to be encompassed within the scope of the invention. In one aspect, provided herein are deuterated or tritiated analogs of compounds of Formula I.

It is also to be understood that compounds that have the same molecular formula but differ in the nature or sequence of bonding of their atoms or the arrangement of their atoms

in space are termed "isomers." Isomers that differ in the arrangement of their atoms in space are termed "stereoisomers."

Stereoisomers that are not mirror images of one another are termed "diastereomers" and those that are non-superimposable mirror images of each other are termed "enantiomers." When a compound has an asymmetric center, for example, it is bonded to four different groups, a pair of enantiomers is possible. An enantiomer can be characterized by the absolute configuration of its asymmetric center and is described by the R- and S-sequencing rules of Cahn and Prelog, or by the manner in which the molecule rotates the plane of polarized light and designated as dextrorotatory or levorotatory (i.e., as (+) or (-)-isomers respectively). A chiral compound can exist as either individual enantiomer or as a mixture thereof. A mixture containing equal proportions of the enantiomers is called a "racemic mixture."

"Tautomers" refer to compounds that are interchangeable forms of a particular compound structure, and that vary in the displacement of hydrogen atoms and electrons. Thus, two structures may be in equilibrium through the movement of  $\pi$  electrons and an atom (usually H). For example, enols and ketones are tautomers because they are rapidly interconverted by treatment with either acid or base. Another example of tautomerism is the aci- and nitro-forms of phenyl nitromethane, that are likewise formed by treatment with acid or base.

Tautomeric forms may be relevant to the attainment of the optimal chemical reactivity and biological activity of a compound of interest.

Compounds of the invention may also exist as "rotamers," that is, conformational isomers that occur when the rotation leading to different conformations is hindered, resulting in a rotational energy barrier to be overcome to convert from one conformational isomer to another.

The compounds of this invention may possess one or more asymmetric centers, such compounds can therefore be produced as individual (R)- or (S)-stereoisomers or as mixtures thereof.

Unless indicated otherwise, the description or naming of a particular compound in the specification and claims is intended to include both individual enantiomers and mixtures, racemic or otherwise, thereof. The methods for the determination of stereochemistry and the separation of stereoisomers are well-known in the art.

In some embodiments, the compound can be provided as a prodrug. The term "prodrug", as employed herein, denotes a compound which, upon administration to a subject, undergoes chemical conversion by metabolic or chemical processes to yield a compound of the Formula (I), or a salt and/or solvate thereof.

In some embodiments, the compounds of the invention, and salts thereof, are substantially isolated. By "substantially isolated" is meant that the compound is at least partially or substantially separated from the environment in which it was formed or detected. Partial separation can include, for example, a composition enriched in the compound of the invention. Substantial separation can include compositions containing at least about 50%, at least about 60%, at least about 70%, at least about 80%, at least about 90%, at least about 95%, at least about 97%, or at least about 99% by weight of the compound of the invention, or salt thereof.

As used herein, the phrase "optionally substituted" means unsubstituted or substituted. As used herein, the term "substituted" means that a hydrogen atom is removed and replaced by a substituent. It is understood that substitution at a given atom is limited by valency.

The compounds according to the invention have been found to have pharmacologically important properties which can be used therapeutically. The compounds of the invention can be used alone, in combination with each other or in combination with other active compounds. Compounds of Formula (I) may be inhibitors of NMDA (N-methyl-D-aspartate)-receptors, more particularly subtype specific inhibitors of NMDA NR2B receptors. It is therefore a part of the subject-matter of this invention that the compounds of the invention and their salts and also pharmaceutical preparations which comprise these compounds or their salts, can be used for treating or preventing disorders associated with, accompanied by and/or covered by NR2B receptor hyperactivity and/or disorders in which inhibiting NR2B receptors is of value.

In various embodiments, the compounds of the invention are inhibitors of the NR2B receptor with  $IC_{50}$  values  $<10 \mu M$ , preferably  $\leq 1 \mu M$  and more preferably  $\leq 100 nM$ .

#### Exemplary Pharmaceutical Compositions

The present invention further provides pharmaceutical compositions comprising a therapeutically effective amount of a compound of Formula I or a pharmaceutically acceptable salt, solvate, polymorph, or N-oxide thereof for use in medicine, e.g. in human or veterinary medicine. In some embodiments, the composition further comprises a pharmaceutically acceptable carrier.

An effective dose of the compounds according to the invention, or their salts, solvates or prodrugs thereof is used, in addition to physiologically acceptable carriers, diluents and/or adjuvants for producing a pharmaceutical composition. The dose of the active compounds can vary depending on the route of administration, the age and weight of the patient, the nature and severity of the diseases to be treated, and similar factors. The daily dose can be given as a single dose, which is to be administered once, or be subdivided into two or more daily doses, and is as a rule 0.001-5000 mg. Particular preference is given to administering daily doses of 0.1-3000 mg, e.g. 1-2000 mg.

Suitable administration forms are oral, parenteral, intravenous, transdermal, topical, inhalative, intranasal and sublingual preparations. Particular preference is given to using oral, parenteral, e.g. intravenous or intramuscular, intranasal preparations, e.g. dry powder or sublingual, of the compounds according to the invention. The customary galenic preparation forms, such as tablets, sugar-coated tablets, capsules, dispersible powders, granulates, aqueous solutions, alcohol-containing aqueous solutions, aqueous or oily suspensions, syrups, juices or drops, can be used.

Solid medicinal forms can comprise inert components and carrier substances, such as calcium carbonate, calcium phosphate, sodium phosphate, lactose, starch, mannitol, alginates, gelatine, guar gum, magnesium stearate, aluminium stearate, methyl cellulose, talc, highly dispersed silicic acids, silicone oil, higher molecular weight fatty acids, (such as

stearic acid), gelatine, agar agar or vegetable or animal fats and oils, or solid high molecular weight polymers (such as polyethylene glycol); preparations which are suitable for oral administration can comprise additional flavourings and/or sweetening agents, if desired.

Liquid medicinal forms can be sterilized and/or, where appropriate, comprise auxiliary substances, such as preservatives, stabilizers, wetting agents, penetrating agents, emulsifiers, spreading agents, solubilizers, salts, sugars or sugar alcohols for regulating the osmotic pressure or for buffering, and/or viscosity regulators.

Examples of such additives are tartrate and citrate buffers, ethanol and sequestering agents (such as ethylenediaminetetraacetic acid and its non-toxic salts). High molecular weight polymers, such as liquid polyethylene oxides, microcrystalline celluloses, carboxymethyl celluloses, polyvinylpyrrolidones, dextrans or gelatine, are suitable for regulating the viscosity. Examples of solid carrier substances are starch, lactose, mannitol, methyl cellulose, talc, highly dispersed silicic acids, high molecular weight fatty acids (such as stearic acid), gelatine, agar agar, calcium phosphate, magnesium stearate, animal and vegetable fats, and solid high molecular weight polymers, such as polyethylene glycol.

Oily suspensions for parenteral or topical applications can be vegetable, synthetic or semisynthetic oils, such as liquid fatty acid esters having in each case from 8 to 22 carbon atoms in the fatty acid chains, for example palmitic acid, lauric acid, tridecanoic acid, margaric acid, stearic acid, arachidic acid, myristic acid, behenic acid, pentadecanoic acid, linoleic acid, elaidic acid, brassidic acid, erucic acid or oleic acid, which are esterified with monohydric to trihydric alcohols having from 1 to 6 carbon atoms, such as methanol, ethanol, propanol, butanol, pentanol or their isomers, glycol or glycerol. Examples of such fatty acid esters are commercially available miglyols, isopropyl myristate, isopropyl palmitate, isopropyl stearate, PEG 6-capric acid, caprylic/capric acid esters of saturated fatty alcohols, polyoxyethylene glycerol trioleates, ethyl oleate, waxy fatty acid esters, such as artificial ducktail gland fat, coconut fatty acid isopropyl ester, oleyl oleate, decyl oleate, ethyl lactate, dibutyl phthalate, diisopropyl adipate, polyol fatty acid esters, inter alia. Silicone oils of differing viscosity, or fatty alcohols, such as isotridecyl alcohol, 2-octyl-dodecanol, cetylstearyl alcohol or oleyl alcohol, or fatty acids, such as oleic acid, are also suitable. It is furthermore possible to use vegetable oils, such as castor oil, almond oil, olive oil, sesame oil, cotton seed oil, groundnut oil or soybean oil.

Suitable solvents, gelatinizing agents and solubilizers are water or water-miscible solvents. Examples of suitable substances are alcohols, such as ethanol or isopropyl alcohol, benzyl alcohol, 2-octyldodecanol, polyethylene glycols, phthalates, adipates, propylene glycol, glycerol, di or tripropylene glycol, waxes, methyl cellosolve, cellosolve, esters, morpholines, dioxane, dimethyl sulphoxide, dimethylformamide, tetrahydrofuran, cyclohexanone, etc.

Cellulose ethers which can dissolve or swell both in water or in organic solvents, such as hydroxypropylmethyl cellulose, methyl cellulose or ethyl cellulose, or soluble starches, can be used as film-forming agents.

Mixtures of gelatinizing agents and film-forming agents are also perfectly possible. In this case, use is made, in particular, of ionic macromolecules such as sodium carboxymethyl cellulose, polyacrylic acid, polymethacrylic acid and their salts, sodium amylopectin semiglycolate, alginic acid or propylene glycol alginate as the sodium salt, gum arabic, xanthan gum, guar gum or carrageenan. The

following can be used as additional formulation aids: glycerol, paraffin of differing viscosity, triethanolamine, collagen, allantoin and novantisolic acid. Use of surfactants, emulsifiers or wetting agents, for example of sodium lauryl sulphate, fatty alcohol ether sulphates, di-Na N-lauryl- $\beta$ -iminodipropionate, polyethoxylated castor oil or sorbitan monooleate, sorbitan monostearate, polysorbates (e.g. Tween), cetyl alcohol, lecithin, glycerol monostearate, polyoxyethylene stearate, alkylphenol polyglycol ethers, cetyltrimethylammonium chloride or mono/dialkylpolyglycol ether orthophosphoric acid monoethanolamine salts can also be required for the formulation. Stabilizers, such as montmorillonites or colloidal silicic acids, for stabilizing emulsions or preventing the breakdown of active substances such as antioxidants, for example tocopherols or butylhydroxyanisole, or preservatives, such as phydroxybenzoic acid esters, can likewise be used for preparing the desired formulations.

Preparations for parenteral administration can be present in separate dose unit forms, such as ampoules or vials. Use is preferably made of solutions of the active compound, preferably aqueous solution and, in particular, isotonic solutions and also suspensions. These injection forms can be made available as ready-to-use preparations or only be prepared directly before use, by mixing the active compound, for example the lyophilisate, where appropriate containing other solid carrier substances, with the desired solvent or suspending agent.

Intranasal preparations can be present as aqueous or oily solutions or as aqueous or oily suspensions. They can also be present as lyophilisates which are prepared before use using the suitable solvent or suspending agent.

Inhalable preparations can present as powders, solutions or suspensions. Preferably, inhalable preparations are in the form of powders, e.g. as a mixture of the active ingredient with a suitable formulation aid such as lactose.

The preparations are produced, aliquoted and sealed under the customary antimicrobial and aseptic conditions.

As indicated above, the compounds of the invention may be administered as a combination therapy with further active agents, e.g. therapeutically active compounds useful in the treatment of central nervous system disorders. Exemplary compounds useful in the present invention include, but are not limited to:

- Tricyclic antidepressants, e.g. Imipramine, Desipramine, Clomipramine, Amitriptyline;

For a combination therapy, the active ingredients may be formulated as compositions containing several active ingredients in a single dose form and/or as kits containing individual active ingredients in separate dose forms. The active ingredients used in combination therapy may be co-administered or administered separately.

While the foregoing specification teaches the principles of the present invention, with examples provided for the purpose of illustration only, it will be understood that the practice of the invention encompasses all of the usual

variations, adaptations and/or modifications as come within the scope of the following claims and their equivalents.

SEM-pyrazolo-4-boronic acid pinacol ester was prepared according the procedure from W02011/130146, page 84. A solution of pyrazolboronic acid pinacolester (20 g, 103 mmol) in DMF (180 mL) was cooled to 0° C. and treated with sodium hydride (60% dispersion in oil) (6.2 g, 150 mmol) in nitrogen atmosphere.

The reaction mixture was stirred at ambient temperature for 30 minutes. The reaction mixture was then cooled to 0° C. and (2-(chloromethoxy ethyl)trimethylsilane (23.65 ml, 134 mmol) was added. The reaction mixture was stirred at ambient temperature overnight.

The reaction mixture was poured into aqueous saturated ammonium chloride (200 mL) containing ice (approximately 200 mL) and stirred until the ice melted. The cold mixture was extracted with ethyl acetate twice. The combined organic extracts were washed with water, dried over Na<sub>2</sub>SO<sub>4</sub>, and concentrated under reduced pressure to afford SEM-pyrazolo-4-boronic acid pinacol ester (27.6 g, 86% yield).

Synthesis of Intermediate (2):  
3-(chloromethyl)-5-propyl-1H-pyrazole  
Hydrochloride

## Step 1

To a suspension of 1.23 g (32 mmol) of  $\text{LiAlH}_4$  in THF (100 mL) was added a solution of 5-propyl-1H-pyrazole-3-carboxylic acid ethyl ester (1.82 g, 10 mmol) in THF (50 mL) in small portions at  $0^\circ\text{C}$ . After stirring for 1 h at  $0^\circ\text{C}$  and 12 h at room temperature, the mixture was hydrolyzed with a water-methanol solution (v/v, 85:15) (100 mL). The metallic hydroxides were filtered off and washed with ethanol.

The organic layer was separated and the aqueous one was extracted with dichloromethane ( $3 \times 100$  mL). These extracts were then combined with the above organic layer, dried ( $\text{Na}_2\text{SO}_4$ ) and evaporated to dryness. A residual syrup was obtained and purified by flash chromatography on silica gel using toluene-acetone-ethanol (v/v, 1:1:1) as the eluent.

Removal of the solvent from the appropriate fractions gave (5-propyl-1H-pyrazol-3-yl)-methanol. Yield: 840 mg (60%).

## Step 2

To a mixture of (5-propyl-1H-pyrazol-3-yl)-methanol (840 mg, 6 mmol) in dichloromethane (25 mL), neat  $\text{SOCl}_2$  (100 mL) was added in portions at  $0^\circ\text{C}$  and stirred at room temperature for 12 h. The excess  $\text{SOCl}_2$  was removed by distillation under reduced pressure. The residue was dissolved in ethanol (150 mL) and filtered, and diethylether was added to produce white plates. Yield: 1.11 g (95%) MS (ESI m/z) 159.0  $[\text{M}+\text{H}]^+$ .

Example 1: Succinate Salt of 4-[2-[4-[4-chloro-3-(difluoromethoxy)phenyl]pyrazol-1-yl]ethyl]-3,5-dimethyl-1H-pyrazole

Step 1:

4-bromo-1-chloro-2-difluoromethoxy-benzene

4-bromo-1-chloro-2-difluoromethoxy-benzene was prepared according to the method described in WO2007/065655, which is incorporated herein by reference in its entirety.

27

4-bromo-2-chlorophenol (10.0 g; 48 mmol) was dissolved in DMF (100 mL) and water (15 mL) was added followed by sodium chloro-2,2-difluoro acetate (21.5 g, 150 mmol) and potassium carbonate (13.2 g, 96 mmol).

The mixture was stirred for 15 minutes at room temperature and then heated to 100° C. for 2 hours under nitrogen. The mixture was partitioned between water (200 mL) and ethyl acetate (200 mL). The organic phase was separated, dried over sodium sulphate, filtered, and concentrated in vacuum to give a crude product.

The crude product was purified by silica gel chromatography eluting with 0-80% EtOAc in hexane to give 4-bromo-1-chloro-2-difluoromethoxy-benzene (7.5 g, 61% yield) as colorless oil.

Step 2: 4-(4-chloro-3-difluoromethoxy-phenyl)-1-SEM-1H-pyrazole

The mixture of 4-bromo-1-chloro-2-difluoromethoxybenzene (7.5 g, 29 mmol), SEM-pyrazolo-4-boronic acid pinacol ester (17.2 g, 53 mmol), Na<sub>2</sub>CO<sub>3</sub> (6.4 g, 60 mmol), toluene (300 mL), ethanol (50 mL) and water (25 mL) was vacuumed and refilled with nitrogen, followed by the addition of Pd(PPh<sub>3</sub>)<sub>4</sub> (1.155 g, 1 mmol).

After stirring at 90° C. for 6 hours the mixture was cooled to room temperature and water (200 mL) was added. The organic phase was separated, dried over sodium sulphate, filtered, and concentrated in vacuum to give a crude product. Purification using column chromatography (5-10% methanol in dichloromethane as eluent) and recrystallization from ethanol provided the product. Yield: 6.08 g (56%).

Step 3:

4-(4-chloro-3-difluoromethoxy-phenyl)-1H-pyrazole

To a solution of 4-(4-chloro-3-difluoromethoxy-phenyl)-1-SEM-1H-pyrazole (5.1 g, 13.6 mmol) in dry dioxane (50 mL) was added hydrogen chloride, 4.0 M solution in dioxane (34 mL, 136 mmol). The reaction mixture was stirred at room temperature for 16 hours, then concentrated in vacuum to give a solid, which was dissolved in EtOAc (200 mL).

An aqueous saturated NaHCO<sub>3</sub> solution was added (200 mL), the layers were separated, and the aqueous phase was

28

extracted 3 times with EtOAc (3×100 mL). The combined organic phases were dried over sodium sulphate and concentrated in vacuum to give a solid. This product was then dissolved CH<sub>2</sub>Cl<sub>2</sub> and purified by flash column chromatography on silica gel (elution with CH<sub>2</sub>Cl<sub>2</sub>/MeOH 100/0 to 95/5). The fraction with the product was concentrated to give a white solid. Yield: 2.6 g (78%). MS (ESI m/z) 245.6 [M+H]<sup>+</sup>.

Step 4: 4-{2-[4-(4-Chloro-3-difluoromethoxy-phenyl)-pyrazol-1-yl]-ethyl}-3,5-dimethyl-1H-pyrazole

To a solution of 4-(4-chloro-3-difluoromethoxy-phenyl)-1H-pyrazole (123 mg, 0.50 mmol) in dry DMF (4.0 mL) was vacuumed and refilled with nitrogen, followed by addition of sodium hydride, 60% in paraffin oil (22 mg, 0.55 mmol).

The reaction mixture was stirred at room temperature for 20 minutes, then 4-(2-chloro-ethyl)-3,5-dimethyl-1H-pyrazole (159 mg, 1.0 mmol) (ChemDiv, BB01-4360) was added. The reaction mixture was stirred at room temperature for 20 hours. The mixture was partitioned between water (50 mL) and ethyl acetate (50 mL).

The organic phase was separated, dried over sodium sulphate, filtered, and concentrated in vacuo to give a crude product. The crude product was purified by silica gel chromatography eluting with 0-100% EtOAc in hexane to give 4-{2-[4-(4-Chloro-3-difluoromethoxy-phenyl)-pyrazol-1-yl]-ethyl}-3,5-dimethyl-1H-pyrazole (123 mg, 67% yield) as colorless resin. MS (ESI m/z) ∅ 1.98 (s, 6H); 2.82 (t, 2H, J=7.35); 4.12 (t, 2H, J=7.35); 7.18 (t, 1H, J=7.34); 7.46 (m, 1H); 7.52 (m, 2H); 7.95 (s, 1H); 8.11 (s, 1H); 11.92 (s, 1H).

Step 5 Formation of the Succinate Salt of 4-{2-[4-(4-chloro-3-difluoromethoxy-phenyl)-pyrazol-1-yl]-ethyl}-3,5-dimethyl-1H-pyrazole

To a mixture of 4-{2-[4-(4-chloro-3-difluoromethoxyphenyl)-pyrazol-1-yl]-ethyl}-3,5-dimethyl-1H-pyrazole (1.00 g, 2.83 mmol) and succinic acid (1.00 g, 2.83 mmol), was added ethanol (30 mL) and the mixture was heated to 78° C. and stirred for 5 minutes until clear solution. The solvent was evaporated and the resulting solid was dried overnight at 50° C. under reduced pressure, to yield example 1 (1.00 g, 2.83 mmol) as a white solid. Succinate salt (.C<sub>4</sub>H<sub>6</sub>O<sub>4</sub>) (m.p.: 79-81° C.)

The examples in Table 1 were prepared as described in example 1 replacing 4-(2-chloro-ethyl)-3,5-dimethyl-1H-pyrazole with the appropriate chloroalkyl-1H-pyrazole derivative.

#### Biological Assays

##### Inhibition of Specific Binding to the Rat NR1/NR2B Receptor

Male Wistar rats (180 to 200 g) were killed by suffocation in a CO<sub>2</sub> chamber for two minutes. Whole brains without cerebellum were removed and dissected on ice, placed into closed vials and stored at -70° C.

Membrane fractions were prepared and tested using standard techniques. At the time of the assay, 1 g of the brains was placed into 25 ml of 50 mM Tris/10 mM EDTA buffer, pH 7.1, (25 vol. per g of original tissue) and homogenized for 30 sec at 20000 rpm with an Ultraturax T25 (Jahnke &

Kunkel, IKA-Labortechnik, Staufen, Germany). The homogenate was centrifuged at 4° C. for 10 min at 48000 g (OPTIMA L-70, Beckman, Palo Alto, Calif 94304, USA).

The supernatant was discarded and the pellet was homogenized on ice for 30 sec at 20000 rpm with an Ultraturrax and again centrifuged at 48000 g for 30 minutes at 4° C. The resultant pellet was resuspended in 25 ml of 50 mM Tris/10 mM EDTA buffer, homogenized for 30 sec with an Ultraturrax, aliquoted, frozen at -70° C. and stored until use.

After thawing on the day of the assay, a 5 ml membrane aliquot was centrifuged at 48000 g for 30 min at 4° C. The pellet was resuspended in 5 ml of 5 mM Tris/1 mM EDTA buffer, pH 7.4, homogenized for 30 sec at 20000 rpm with an Ultraturrax and centrifuged at 48000 g for 30 min at 4° C. This was repeated twice. The final pellet was homogenized in 5 ml of 5 mM Tris/1 mM EDTA buffer at 4° C. with an Ultraturrax and used for the Ifenprodil-binding assay as described in the following.

The incubation mixture of 200 µl contained 5 nmol/l [<sup>3</sup>H]-Ifenprodil, an optimised amount of membrane preparation, 5 mM Tris/1 mM EDTA (pH 7.4, 100 µM R(+)-3-PPP, 1 µM GBR-12909, 1 µM GBR-12935) and test compound in 1% DMSO. Nonspecific binding was estimated in the presence of 10M CP101.606. The samples were incubated for 60 min. at 4° C.

The incubation was terminated by filtration of the membrane preparations using Filtermat B (Pharmacia, Uppsala Sweden) and a Micro Cell Harvester (Skatron, Lier, Norway). The Filtermat B had been presoaked with 1% polyethylene imine and carefully washed with 50 mM Tris/HCl-buffer pH 7.7 after the filtration to separate free and bound radioactivity. The filters were counted in a scintillation counter (Betaplate 1205, Berthold, Wildbad, Germany) in order to determine the specific binding of [<sup>3</sup>H]-Ifenprodil.

The optimal amount of membrane preparation in the assay was determined and optimized for each membrane preparation separately before the test.

Test compounds were either screened at 6 to 10 increasing concentrations for the determination of IC<sub>50</sub> and Ki or at 2-4 concentrations for the determination of the percent inhibition. For pipetting of the incubation mixture the robot Biomek2000 (Fa. Beckman) was used.

For determination of IC<sub>50</sub> values the Hill-plot, 2-parameter-model was used. In the NR1/NR2B binding assay a dissociation constant (K<sub>D</sub>) of [<sup>3</sup>H]-Ifenprodil of 9 nM was determined.

#### HNR2BC: Effects of Test Articles on Cloned Human NR1/NR2B Ion Channels Expressed in Mammalian Cells

The ability of test compounds to act as an antagonist of NR1/NR2B was evaluated with a calcium influx assay (Calcium 5 Assay Kit, Molecular Devices).

For the antagonist assessment, NR1/NR2B was activated with the positive control agonist (Mg<sup>2+</sup>-free HBPS+100 μM glutamic acid+100 μM glycine). The effect of each test article to inhibit the signal was examined after agonist stimulation and compared to the positive control antagonist (MK-801). The signal elicited in the presence of the positive agonist (Mg<sup>2+</sup>-free HBPS+100 μM glutamic acid+100 μM glycine) was set to 100 (0% inhibition) and the signal from the positive antagonist (Mg<sup>2+</sup>-free HBPS+100 μM glutamic acid+100 μM glycine+100 μM MK-801) was set to 0 (100% inhibition).

#### Cell Culture:

A HEK cell line, stable transfected with hNR1/NR2B was used. This tetracycline inducible cell line is transfected with GRIN1 (GeneBank accession number NM\_007327.2) and GRIN2B (GeneBank accession number NM\_000834.3.). The cells were cultured in cell culture flasks with DMEM/F12 supplemented with 10% FCS, 1% PenStrep and a selection of additional antibiotics.

Forty-Eight (48) hours before the assay the cells were plated into 96-well black well, flat clear bottom microtiter plates at a density of 50000 cells/well. Twenty-Four (24) hours later the receptor expression was induced by the addition of 1 μg/ml tetracycline in the presence of 2 mM ketamine and 200 μM 7-CKA. After 24 h of receptor induction the plates were used for the assay.

#### Assay:

The medium was removed and the cells were loaded with 200 μl loading buffer (Molecular Devices) in Mg<sup>2+</sup>-free HBPS containing 100 μM 7-CKA at 37° C. for one (1) hour.

The test compounds were then solubilized in 100% DMSO and diluted to yield eight (8) different concentrations in 100% DMSO. A 96 well drug plate was prepared by diluting with water and glycine/glutamate to a 5-fold of final test concentration. Fluorescence intensity of the cells in the plate was measured in a FlexStation using an excitation wavelength of 485 nm and an emission wavelength of 525 nm. Twenty (20) seconds after starting the recordings the compounds together with the agonists glycine (100 μM) and

86

glutamate (100 μM) were added into the wells and the fluorescence measured for ninety (90) seconds in summary.

The IC<sub>50</sub> values provided in the paragraph below were determined using a 3 parameter plot.

#### Inhibition of Specific Binding to the hERG—Receptor (HERGBD)

A HEK cell line with stable transfected human ERG receptor was used for the assay. The cells were grown adherently and maintained in DULBECCOS' MEM medium with 10% FBS, 1% non-essential amino acids, 1% Penicillin/Streptomycin and 400 μg/ml G418 (Calbiochem).

Cells were split 2-3 times weekly between 1:3 and 1:4. For binding assays and membrane preparations the cell culture medium was removed, cells were washed with PBS. Crude membranes for radioligand binding experiments were prepared by scraping the cells off the dishes in ice cold 20 mM HEPES/0.1 mM KCl/pH 7.2. The cell suspension was homogenized on ice (Ultra turrax, 3×20 sec.) and the homogenate was spun for 10 min (1° C., 1000 g, OPTIMA, SW28, 2800 U/min). The supernatant was then centrifuged for 40 min at 100000 g (1° C., OPTIMA, SW28, 23000 U/min). The membrane pellet was re-suspended in 20 mM HEPES/0.1 mM KCl pH 7.2, frozen and stored at -80° C.

After thawing on the day of the assay, the membrane suspension was diluted further with 20 mM HEPES/0.1 mM KCl/pH 7.2.

The incubation mixture of 200 μl contained 1.5 nmol/l 3H-Dofetilide, optimized amount of membrane preparation, 20 mM HEPES/0.1 mM KCl/(pH 7.2) and inhibitor in 1% DMSO. Nonspecific binding was estimated in the presence of 10 M Dofetilide. The samples were incubated for 90 min. at RT.

Binding was terminated by filtration of the incubated membrane preparations using Filtermat B (Pharmacia, Uppsala Sweden) and a Micro Cell Harvester (Skatron, Lier, Norway). The Filtermat B had been presoaked with 1% polyethylen imine and carefully washed with 0.05 M Tris/HCl-buffer pH=7.7 after the filtration to separate free and bound radioactivity. The filters were counted in a scintillation counter (Betaplate 1205, Berthold, Wildbad, Germany) in order to determine the specific binding of [<sup>3</sup>H]-Dofetilide.

The optimal amount of membrane preparation in the assay was determined and optimized for each membrane preparation separately in front of using the membranes in compound testing.

Test compounds were either screened at 6 to 10 increasing concentrations for the determination of IC<sub>50</sub> and K<sub>i</sub> or at 2-4 concentrations for the determination of the percent inhibition. For pipetting of the incubation mixture we routinely use the robot Biomek2000 (Fa. Beckman).

### RRNR2BB Inhibition of Specific Binding to the Rat NR1/NR2B Receptor

Male Wistar rats (180 to 200 g) were killed by suffocation in a CO<sub>2</sub> chamber for two minutes. Whole brains without cerebellum were removed and dissected on ice, placed into closed vials and stored at -70° C.

The supernatant was discarded and the pellet was homogenized on ice for 30 sec at 20000 U/min with an Ultraturrax and again centrifuged at 48000 g for 30 minutes at 4° C. The resulted pellet was resuspended in 25 ml of 50 mM Tris/10 mM EDTA buffer, homogenized for 30 sec with an Ultraturrax, aliquoted, frozen at -70° C. and stored until use.

The pellet was resuspended in 5 ml of 5 mM Tris/1 mM EDTA buffer, pH=7.4, homogenized for 30 sec at 20000 U/min with an Ultraturrax and centrifuged at 48000 g for 30 min at 4° C. This step was repeated twice. The final pellet was homogenized in 5 ml of 5 mM Tris/1 mM EDTA buffer at 4° C. with an Ultraturrax and used for the Ifenprodil-binding assay.

The incubation mixture of 200 µl contained 5 nmol/l [<sup>3</sup>H]-Ifenprodil, optimised amount of membrane preparation, 5 mM Tris/1 mM EDTA (pH 7.4, 100 µM R(+)-3-PPP, 1 µM GBR-12909, 1 µM GBR-12935) and inhibitor in 1% DMSO. Nonspecific binding was estimated in the presence of 10 M CP101.606. The samples were incubated for 60 min. at 4° C.

The IC<sub>50</sub> values in the tables below were determined using the Hill-plot, 2-parameter-model. In the NR1/NR2B binding assay a dissociation constant (K<sub>D</sub>) of [<sup>3</sup>H]-Ifenprodil was determined to be 9 nM. The specific binding in this assay was about 80%.

#### Forced Swim Test in Mice

The compounds of the invention show significant antidepressive effects in the forced swim test in mice, an animal model of depression at doses of 100 mg/kg or below.

The method, which detects antidepressant activity, follows that described by Porsolt et al (Arch. Int. Pharmacodyn., 229, 327-336, 1977), which is incorporated by reference herein in its entirety.

Mice forced to swim in a situation from which they cannot escape rapidly become immobile. Antidepressants decrease the duration of immobility.

Male NMRI mice (Janvier, France), weighing 20-30 g, were individually placed in a cylinder (height=24 cm; diameter=13 cm) containing 10 cm water (22° C.) from which they cannot escape.

The mice were placed in the water for 6 minutes and the duration of immobility during the last 4 minutes was measured. The latency to the first bout of immobility was also recorded starting from the beginning of the test. 10 mice were studied per group. The test substance was administered p.o. 30 minutes before the test and compared with vehicle control group. The test was performed blind. The results are shown in the table below.
