TECHNICAL FIELD

The present invention relates to a novel class of inhibitors of protein kinases useful in the treatment of proliferative cell diseases and conditions including cancers.

PRIORITY DOCUMENT

The present application is a 371 Application of International Application No PCT/AU2016/000269, filed 4 Aug. 2016, which claims priority from Australian Provisional Patent Application No 2015903106 titled "Novel kinase inhibitors II" filed on 4 Aug. 2015, the contents of which are hereby incorporated by reference in their entirety.

INCORPORATION BY REFERENCE

The following publication is referred to herein and its contents are hereby incorporated by reference in their entirety:

International Patent Application No PCT/GB2013/050982 (WO 2013/156780) titled "Therapeutic compounds" in the name of Changzhou Le Sun Pharmaceuticals Limited.

BACKGROUND

There is an ongoing need to identify and develop new compounds for treating proliferative diseases and conditions including cancers. Among the numerous "targets" for potential anti-proliferative compounds under investigation are the group of enzymes known as protein kinases.

Cyclin-dependent kinases (CDKs) are a type of protein kinase. They are known to be associated with various cyclin subunits, playing pivotal roles in the regulation of a variety of important regulatory pathways in cells, including cell-cycle control, apoptosis, neuronal physiology, differentiation and transcription. There are more than 20 CDKs which may be classified into two major groups, reflecting their functions; namely, the cell cycle regulator CDKs and the transcription regulator CDKs. The class of the cell cycle regulator CDKs includes CDK 1, CDK2, CDK3, CDK4 and CDK6, and they function with their cyclin partners (eg cyclin A, B, D1, D2, D3, E and F) to regulate promotion of the cell cycle. The class of the transcription regulator CDKs includes CDK7, CDK8, CDK9 and CDK 11, which work together with cyclin C, H, K, L1, L2, T1 and T2 and tend to play roles in transcriptional regulation. Given the functions of these two CDK classes, it is perhaps not surprising that CDKs have been implicated in cell proliferation diseases and conditions, particularly cancer. Cell proliferation is a result of the direct or indirect deregulation of the cell division cycle and the CDKs play a critical role in the regulation of the various phases of this cycle. Therefore, inhibitors of CDKs and their associated cyclins are considered to be useful targets for cancer therapy.

2

Certain pyrimidine-based compounds have been previously investigated for use in treating proliferative cell diseases and conditions including cancers, for example, 4-thiazol-2-pyridinylamino-pyrimidines and 5-substituted-4-thiazol-pyrimidines (see International patent publications WO 2005/012298 and WO2013/156780, respectively). These compounds inhibit multiple protein kinases, particularly CDKs, including CDK1/cyclin B, CDK2/cyclin E, CDK2/cyclin A, CDK4/cyclin D1, CDK7/cyclin H and CDK9/cyclin T1.

The present applicant has now identified a new class of thiazole-pyrimidine compounds for use in the prevention and/or treatment of proliferative diseases and conditions including cancers. While not wishing to be bound by theory, it is considered that these novel compounds are capable of inhibiting cell proliferation by inhibiting the activity of CDK4 and/or CDK6.

DETAILED DESCRIPTION

The present applicant has now identified a new class of 4-thiazol-N-(pyridin-2-yl)pyrimidin-2-amine derivatives suitable for use in the prevention and/or treatment of proliferative cell diseases and conditions including cancers, which possess desirable biological activity (eg the compounds may inhibit cell proliferation by inhibiting the activity of CDK4 and/or CDK6).

In a first aspect, the present invention provides a compound of formula I shown below:

wherein:

z represents an optional bond such that the bond between N and the adjacent carbon atom can be a single or double bond;

5 R¹, R², R³, R⁴, R⁵, R⁶, and R⁷ are each independently selected from the group consisting of H, alkyl, alkyl-R¹⁰, aryl, aryl-R¹⁰, aralkyl, aralkyl-R¹¹, halogen, NO₂, CN, CF₃, OH, O-alkyl, COR¹⁰, COOR¹⁰, O-aryl, O-R¹⁰, NH₂, NH-alkyl, NH-aryl, N-(alkyl)₂, N-(aryl)₂, N-(alkyl)(aryl), NH-R¹⁰, N-(R¹⁰)(R¹¹), N-(alkyl)(R¹⁰), N-(aryl)(R¹⁰), SH-alkyl, SH-aryl, S-(alkyl)₂, S-(aryl)₂, S-(alkyl)(aryl), SH-R¹⁰, S-(R¹⁰)(R¹¹), S-(alkyl)(R¹⁰), S-(aryl)(R¹⁰), COOH, CONH₂, CONH-alkyl, CONH-aryl, CON-(alkyl)(R¹⁰), CON(aryl)(R¹⁰), CONH-R¹⁰, CON-(R¹⁰)(R¹¹), SO₃H, SO₂-alkyl, SO₂-alkyl-R¹⁰, SO₂-aryl, SO₂-aryl-R¹⁰, SO₂NH₂, SO₂NH-R¹⁰, SO₂N-(R¹⁰)(R¹¹), CF₃, CO-alkyl, CO-alkyl-R¹⁰, CO-aryl, CO-aryl-R¹⁰ and R¹²,

and wherein when bond z is absent, R¹ is taken together with R⁸ and is =O or =S;

25 R⁸ is together with R¹=O or =S when bond z is absent, or is not present when bond z is present;

R⁹ is H, alkyl, aryl or heterocyclic group when bond z is absent, or is not present when bond z is present; and

30 R¹⁰, R¹¹ and R¹² are independently selected from water solubilising groups;

or a pharmaceutically acceptable salt, solvate or prodrug thereof.

In some embodiments, the compounds of formula I may preferably comprise at least one water solubilising group R¹⁰, R¹¹ or R¹². That is, in such embodiments, the compound is as defined above in paragraph [0018] with the proviso that said compound comprises at least one of said R¹⁰, R¹¹ and R¹² groups. The present applicant has found that notwithstanding the addition of such solubilising group(s), the compounds possess desirable biological activity (eg by inhibiting the activity of CDK4 and/or CDK6). The presence of at least one water solubilising group may enhance in vivo absorption and oral bioavailability.

The compounds of formula I have been found to possess anti-proliferative activity and are therefore considered to be of use in the treatment of proliferative cell diseases and conditions such as cancer, leukaemia, lymphoma and other diseases and conditions associated with uncontrolled cell proliferation (or, in other words, requires control of the cell cycle) such as, for example, some cardiovascular diseases or conditions such as restenosis and cardiomyopathy, some auto-immune diseases such as glomerulonephritis and rheumatoid arthritis, dermatological conditions such as psoriasis, and fungal or parasitic disorders. As used herein, an anti-proliferative effect within the scope of the present invention may be demonstrated by the ability to inhibit cell proliferation in an in vitro whole cell assay. These assays, including methods for their performance, are described in more detail in the examples provided hereinafter.

60 The compounds of formula I may inhibit any of the steps or stages in the cell cycle, for example, formation of the nuclear envelope, exit from the quiescent phase of the cell cycle (G₀), G₁ progression, chromosome decondensation, nuclear envelope breakdown, START, initiation of DNA replication, progression of DNA replication, termination of DNA replication, centrosome duplication, G₂ progression, activation of mitotic or meiotic functions, chromosome

condensation, centrosome separation, microtubule nucleation, spindle formation and function, interactions with microtubule motor proteins, chromatid separation and segregation, inactivation of mitotic functions, formation of contractile ring, and cytokinesis functions. In particular, the compounds of formula I may influence certain gene functions such as chromatin binding, formation of replication complexes, replication licensing, phosphorylation or other secondary modification activity, proteolytic degradation, microtubule binding, actin binding, septin binding, microtubule organising centre nucleation activity and binding to components of cell cycle signalling pathways.

Thus, in a second aspect, the present invention provides the use of a compound as defined in the first aspect or a pharmaceutically acceptable salt, solvate or prodrug thereof, for treating cancer or another proliferative cell disease or condition.

In a third aspect, the present invention provides a method of treating cancer or another proliferative cell disease or condition in a subject, the method comprising administering to said subject a therapeutically effective amount of a compound as defined in the first aspect or a pharmaceutically acceptable salt, solvate or prodrug thereof, optionally in combination with a pharmaceutically acceptable carrier, diluent and/or excipient.

In a fourth aspect, the present invention provides the use of a compound as defined in the first aspect, or a pharmaceutically acceptable salt, solvate or prodrug thereof, in the manufacture of a medicament for treating cancer or another proliferative cell disease or condition.

In a fifth aspect, the present invention provides a pharmaceutical composition or medicament comprising a compound as defined in the first aspect and a pharmaceutically acceptable carrier, diluent and/or excipient.

In a sixth aspect, the present invention provides a method for modulating protein kinase activity in a cell, comprising introducing to or contacting said cell with an effective amount of a compound as defined in the first aspect or a pharmaceutically acceptable salt, solvate or prodrug thereof.

In this specification, a number of terms are used which are well known to those skilled in the art. Nevertheless, for the purposes of clarity, a number of these terms are hereinafter defined.

As used herein, the term "treating" includes prophylaxis as well as the alleviation of established symptoms of a condition. As such, the act of "treating" a disease or condition therefore includes: (1) preventing or delaying the appearance of clinical symptoms of the disease or condition developing in a subject afflicted with or predisposed to the disease or condition; (2) inhibiting the disease or condition (ie arresting, reducing or delaying the development of the disease or condition or a relapse thereof (in case of a maintenance treatment) or at least one clinical or subclinical symptom thereof and (3) relieving or attenuating the disease or condition (ie causing regression of the disease or condition or at least one of its clinical or subclinical symptoms).

As used herein, the term "alkyl" includes both straight chain and branched alkyl groups having from 1 to 8 carbon atoms (eg methyl, ethyl, propyl, isopropyl, butyl, isobutyl, tert-butyl, pentyl, hexyl etc).

As used herein, the term "aryl" refers to a substituted (mono- or poly-) or unsubstituted monoaromatic or polyaromatic group, wherein said polyaromatic group may be fused or unfused. The term therefore includes groups having from 6 to 10 carbon atoms (eg phenyl, naphthyl etc). It is also to be understood that the term "aryl" is synonymous with the term "aromatic".

As used herein, the term "aralkyl" is used as a conjunction of the terms alkyl and aryl as defined above.

As used herein, the term "alicyclic" refers to a cyclic aliphatic group.

The term "aliphatic" takes its normal meaning in the art and includes non-aromatic groups such as alkanes, alkenes and alkynes and substituted derivatives thereof.

The term "halogen" refers to fluoro, chloro, bromo and iodo.

As used herein, the term "heterocyclic" refers to a saturated or unsaturated cyclic group comprising one or more heteroatoms in the ring.

The term "derivative" as used herein, includes any chemical modification of an entity. Illustrative of such chemical modifications is the replacement of hydrogen by a halogen group, an alkyl group, an acyl group or an amino group.

As used herein, the phrase "manufacture of a medicament" includes the use of one or more of the compounds of formula I directly as the medicament or in any stage of the manufacture of a medicament comprising one or more of the compounds of formula I.

Some of the compounds of formula I may exist as single stereoisomers, racemates, and/or mixtures of enantiomers and/or diastereomers. All such single stereoisomers, racemates and mixtures thereof, are encompassed within the scope of the present invention. The isomeric forms such as diastereomers, enantiomers, and geometrical isomers can be separated by physical and/or chemical methods known to those skilled in the art.

The term "pharmaceutically acceptable salt" as used herein, refers to salts that retain the desired biological activity of the compounds of formula I, and include pharmaceutically acceptable acid addition salts and base addition salts. Suitable pharmaceutically acceptable acid addition salts of the compounds of formula I may be prepared from an inorganic acid or from an organic acid. Examples of such inorganic acids are hydrochloric, sulfuric and phosphoric acid. Appropriate organic acids may be selected from aliphatic, cycloaliphatic, aromatic, heterocyclic carboxylic and sulfonic classes of organic acids, examples of which are formic, acetic, propionic, succinic, glycolic, gluconic, lactic, malic, tartaric, citric, fumaric, maleic, alkyl sulfonic and arylsulfonic. Additional information on pharmaceutically acceptable salts can be found in Remington's Pharmaceutical Sciences, 19th Edition, Mack Publishing Co., Easton, Pa. 1995.

In the case of compounds of formula I that are solid, it will be understood by those skilled in the art that the compounds (or pharmaceutically acceptable salts, solvates or prodrugs thereof) may exist in different crystalline or polymorphic forms, all of which are encompassed within the scope of the present invention.

"Prodrug" means a compound that undergoes conversion to a compound of formula I within a biological system, usually by metabolic means (eg by hydrolysis, reduction or oxidation). For example, an ester prodrug of a compound of formula I containing a hydroxyl group may be convertible by hydrolysis in vivo to the compound of formula I. Suitable esters of the compounds of formula I containing a hydroxyl group may be, for example, acetates, citrates, lactates, tartrates, malonates, oxalates, salicylates, propionates, succinates, fumarates, maleates, methylene-bis-P-hydroxynaphthoates, gestisates, isethionates, di-p-toluoyltartrates, methanesulfonates, ethanesulfonates, benzenesulfonates, p-toluenesulfonates, cyclohexylsulfamates and quinate. As another example, an ester prodrug of a compound of formula I containing a carboxy

7

group may be convertible by hydrolysis in vivo to the compound of formula I. Examples of ester prodrugs include those described by Leinweber F J, Drug Metab Rev 18:379-439 (1987). Similarly, an acyl prodrug of a compound of formula I containing an amino group may be convertible by hydrolysis in vivo to the compound of formula I. Examples of prodrugs for these and other functional groups, including amines, are provided in Prodrugs: challenges and rewards, Valentino J Stella (ed), Springer, 2007.

The term "therapeutically effective amount" or "effective amount" is an amount sufficient to effect beneficial or desired clinical results. A therapeutically effective amount can be administered in one or more administrations. Typically, a therapeutically effective amount is sufficient for treating a disease or condition or otherwise to palliate, ameliorate, stabilise, reverse, slow or delay the progression of a disease or condition such as, for example, cancer or another proliferative cell disease or condition. By way of example only, a therapeutically effective amount of a compound of formula I, or a pharmaceutically acceptable salt, solvate or prodrug thereof, may comprise between about 0.1 and about 250 mg/kg body weight per day, more preferably between about 0.1 and about 100 mg/kg body weight per day and, still more preferably between about 0.1 and about 25 mg/kg body weight per day. However, notwithstanding the above, it will be understood by those skilled in the art that the therapeutically effective amount may vary and depend upon a variety of factors including the activity of the particular compound (or salt, solvate or prodrug thereof), the metabolic stability and length of action of the particular compound (or salt, solvate or prodrug thereof), the age, body weight, sex, health, route and time of administration, rate of excretion of the particular compound (or salt, solvate or prodrug thereof), and the severity of, for example, the cancer or other proliferative cell disease or condition to be treated.

The compounds of formula I, and pharmaceutically acceptable salts, solvates and prodrugs thereof, are capable of inhibiting protein kinases, especially CDKs and may show higher selectivity (to inhibit) CDK4 and/or CDK6 over other protein kinases. As mentioned above, CDK4 and CDK6 promote cancer cell proliferation. As such, the compounds of formula I, and pharmaceutically acceptable salts, solvates and prodrugs thereof, which are believed to inhibit CDK4 and/or CDK6, have utility in both in vitro and in vivo applications (eg in vitro cell-based assays) and as the basis of a therapeutic method of treating cancer or another proliferative cell disease or condition in a subject.

The compounds of formula I bear a thiazole group attached to the pyrimidine ring through one of the ring carbon atoms (particularly, the carbon at position 4).

The compounds of formula I may bear at least one water solubilising group (eg provided by R¹⁰, R¹¹ and/or R¹²). The term "water solubilising group" will be well understood by those skilled in the art as referring to any polar functional group which either ionises or is capable of forming hydrogen bonds with water molecules to increase the water solubility of the compound (ie relative to the water solubility of the corresponding compound lacking the water solubilising group). Examples of suitable water solubilising groups and methods and considerations for their introduction are described in, for example, Fundamentals of Medicinal Chemistry by Gareth Thomas (publisher: John Wiley & Sons).

Preferably, where present, R¹⁰ and R¹¹ are independently selected from water solubilising groups of the group consisting of:

8

- (i) mono-, di- and poly-hydroxylated alicyclic groups, di- or poly-hydroxylated aliphatic or aryl groups, N-, O- and/or S-containing heterocyclic groups substituted with one or more hydroxyl or amino groups, aliphatic and aryl groups comprising one or more carboxamide, sulfoxide, sulfone or sulfonamide groups, and halogenated alkylcarbonyl groups; and
- ii) COOH, SO₃H, OSO₃H, PO₃H₂ and OPO₃H₂.

For other forms of administration, a pharmaceutical composition may comprise solutions or emulsions which may be injected intravenously, intraarterially, intrathecally, subcutaneously, intradermally, intraperitoneally or intramuscularly, and which are prepared from sterile or sterilisable solutions. A pharmaceutical composition comprising a compound of the present invention may also be in form of suppositories, pessaries, suspensions, emulsions, lotions, ointments, creams, gels, sprays, solutions or dusting powders. The compounds of the present invention may be provided as a pharmaceutically acceptable salt including, for example, suitable acid addition or base salts thereof. A review of suitable pharmaceutical salts may be found in Berge et al., *J Pharm Sci* 66:1-19 (1977). Salts are formed, for example with strong inorganic acids such as mineral acids (eg sulfuric acid, phosphoric acid or hydrohalic acids), with strong organic carboxylic acids, such as alkanecarboxylic acids of 1 to 4 carbon atoms which are unsubstituted or substituted (eg by halogen), such as acetic acid, with saturated or unsaturated dicarboxylic acids (eg oxalic, malonic, succinic, maleic, fumaric, phthalic or tetraphthalic acid), with hydroxycarboxylic acids (eg ascorbic, glycolic, lactic, malic, tartaric or citric acid), with amino acids (eg aspartic or glutamic acid), with benzoic acid, or with organic sulfonic acids (eg (C₁-C₄)-alkyl- or aryl-sulfonic acids which are unsubstituted or substituted by, for example, halogen) such as methane- or p-toluene sulfonic acid).

The compounds of the present invention may be provided in their various crystalline forms, polymorphic forms and (an)hydrous forms. In this regard, it is well known to those skilled in the art that chemical compounds may be isolated in any of such forms by slightly varying the method of purification and or isolation from the solvents used in the synthetic preparation of such compounds.

The present invention further provides a method of synthesising a compound according to the present invention, or a pharmaceutically acceptable salt, solvate or prodrug thereof.

With regard to the description of the synthetic methods described below and in the referenced synthetic methods that are used to prepare starting materials, it will be understood by those skilled in the art that all proposed reaction conditions, including choice of solvent, reaction atmosphere, reaction temperature, duration of the experiment and workup procedures, can be readily selected. Moreover, it will be understood by those skilled in the art that the functionality present on various portions of the molecule must be compatible with the reagents and reaction conditions utilised.

Necessary starting materials may be obtained by standard procedures of organic chemistry. The preparation of such starting materials is described in conjunction with the following representative process variants and within the examples hereinafter. Alternatively, necessary starting materials may be obtainable by analogous procedures to those illustrated which are within the ordinary skill of those skilled in the art. Further, it will be appreciated that during the synthesis of the compounds, in the processes described below, or during the synthesis of certain starting materials, it may be desirable to protect certain substituent groups to prevent their undesired reaction. Those skilled in the art will

64

readily recognise when such protection is required, and how such protecting groups may be put in place, and later removed. Examples of protecting groups are described in, for example, *Protective Groups in Organic Synthesis* by Theodora Green (publisher: John Wiley & Sons). Protecting groups may be removed by any convenient method well known to those skilled in the art as appropriate for the removal of the protecting group in question, such methods being chosen so as to effect removal of the protecting group with the minimum disturbance of groups elsewhere in the molecule. Thus, if reactants include, for example, groups such as amino, carboxyl or hydroxyl, it may be desirable to protect the group in some of the reactions mentioned herein.

The compounds of the present invention may be prepared by, for example, the general synthetic methodologies described in International Patent Publication No WO 2013/156780, which is herein incorporated by reference.

In a further of the present invention, a method of synthesising a compound of the present invention (or a pharmaceutically acceptable salt, solvate or prodrug thereof) is provided wherein the method comprises:

a) reacting a compound of formula IV:

IV

wherein

z represents an optional bond such that the bond between N and the adjacent carbon atom can be a single or double bond; and

R¹, R², R³, R⁸ and R⁹ are as defined in the first aspect; with a compound of formula V:

V

wherein R⁴, R⁵, R⁶ and R⁷ are as defined in the first aspect; and if necessary

b) removing any protecting groups present, and/or forming a pharmaceutically acceptable salt, solvate or prodrug thereof.

The coupling reaction between the compound of formula IV and formula V may take place in the presence of a suitable solvent or solvent mixture. Those skilled in the art will be able to readily select a suitable solvent or solvent mixture for use in this reaction. Examples of suitable solvents include alcohols, acetonitrile, halogenated solvents, etc.

In addition, those skilled in the art will be able to select appropriate reaction conditions to use in the coupling reaction between the compound of formula IV and formula V. However, typically, the reaction will be carried out in anhydrous conditions and in the presence of an inert atmo-

65

sphere, such as argon or nitrogen. The reaction may also be carried out at an elevated temperature, such as, for example, within the range of 80 to 180 C for a suitable time period of, for example, 20 minutes to 48 hours. Suitably, the reaction is carried out under microwave heating, for example, at 80 to 180 C for 20 minutes to 1.5 hour.

The resultant compound can be isolated and purified using techniques well known to those skilled in the art.

The method of synthesising a compound of the present invention (or a pharmaceutically acceptable salt, solvate or prodrug thereof) may further comprise:

66

c) subjecting the compound of formula I to a salt exchange (particularly in situations where the compound is formed as a mixture of different salt forms).

The salt exchange may comprise immobilising the compound on a suitable solid support or resin, and eluting the compound with an appropriate acid to yield salt of the compound of formula I (II or III).

An example of a particularly suitable method for synthesising a compound of the present invention is shown as Scheme 1 below.

Scheme 1

wherein the general reaction conditions are: (a) DMF-DMA or Brederick's reagent, reflux; (b) Select Fluor, MeOH; (c) Et₃N, HgCl₂, DCM; (d) TFA/DCM (1:1), reflux; (e) A, B, NaOH, 2-methoxyethanol, microwave and (f) Pd₂dba₃, xantphos, t-BuONa, dioxane, microwave.

The invention is hereinafter described with reference to the following, non-limiting examples and accompanying figures.

Synthesis

General

¹H and ¹³C NMR spectra were recorded at 300 K on a Bruker AVANCE III 500 spectrometer (¹H at 500 MHz and ¹³C NMR at 125 MHz). ¹H and ¹³C NMR spectra were referenced to ¹H signals of residual non-deuterated solvents (or tetramethylsilane) and ¹³C signals of the deuterated solvents respectively. High resolution mass spectra were recorded on an AB SCIEX TripleTOF® 5600 mass spectrometer, and ionization of all samples was carried out using ESI. The purity of compounds was determined by analytical HPLC, and was greater than 95%. Analytical HPLC was carried out on a Shimadzu Prominence UFLC (UltraFast Liquid Chromatograph) system with a CBM-20A communications bus module, a DGU-20A_{SR} degassing unit, an LC-20AD liquid chromatograph pump, an SIL-20A_{HT} autosampler, an SPD-M20A photo diode array detector, a CTO-20A column oven and a Phenomenex Kinetex 5 u C18 100A 250 mm×4.60 mm column using Method A (gradient 5 to 95% MeOH containing 0.1% FA over 7 min, followed by 95% MeOH containing 0.1% FA over 13 min at a flow rate of 1 mL/min), Method B (gradient 5 to 95% MeCN containing 0.1% FA over 7 min followed by 95% MeCN containing 0.1% FA over 13 min, at a flow rate of 1 mL/min).

1-(4-(6-((4-(2,4-Dimethylthiazol-5-yl)pyrimidin-2-yl)amino)pyridin-3-yl)piperazin-1-yl)ethan-1-one
(1)

To a solution of acetylpiperazine (5.00 g, 39.0 mmol) and 5-bromo-2-nitropyridine (5.00 g, 24.6 mmol) in DMSO (10 mL) was added triethylamine (10.2 mL, 73.9 mmol). The reaction mixture was heated at 120° C. for 16 h, cooled down to room temperature and triturated with EtOAc. The formed solid was filtered and washed with EtOAc (10 mL) and H₂O (30 mL) to give the first portion of 1-(4-(6-nitropyridin-3-yl)piperazin-1-yl)ethan-1-one as a yellow solid. The filtrate and washing were combined and extracted with DCM (3×100mL). The organic extracts were combined, dried over Na₂SO₄ and concentrated under reduced pressure. Kinase Assays

Eurofins Pharma Discovery or Reaction Biology Corporation Kinase Profiler services were used to measure inhibition of CDKs and other kinases by radiometric assay. Inhibition of CDK4/D1, CDK6/D3 and CDK9/T1 were also determined in-house using ADP Glo Kinase assays (Promega Corporation, Madison, USA). Briefly, the kinase reaction for CDK4/D1 and CDK6/D3 was performed with kinase reaction buffer (40 nM Tris base pH 7.5, 20 mM MgCl₂, 0.4 mM DTT), 0.1 mg/ml BSA and RB-CTF substrate (retinoblastoma protein1 C-terminal fraction). For CDK9/CyclinT1, the kinase reaction was performed with standard assay buffer and Kinase Dilution Buffer and RBER-IRStide substrate. Serial dilutions of 1:3 were prepared for test compounds for 10 concentrations (from 10 μM to 0.5 nM). The kinase reactions were started by addition of ATP, incubated for 40 min at 37° C. and then stopped by adding 10 μL of ADP Glo reagent. After incubation at room temperature in the dark for 40 min, 20 μL of kinase detection reagent was added per well and incubated for 40 min. Luminescence was measured using an EnVision Multilabel plate reader (PerkinElmer, Buckinghamshire, UK). Positive and negative controls were performed in the presence and absence of CDK kinases, respectively. Half-maximal inhibition (IC₅₀) values were calculated using a 4-parameter logistic non-linear regression model with Graphpad prism (Version 6.0). Apparent inhibition constants (K_i) values were calculated from K_m (ATP) and IC₅₀ values for the respective kinases. The results are shown in Table 2.

Cell Viability Assay

Compounds from Example 1 were subjected to a standard MTT (3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide) and resazurin assays on solid tumour cell lines and leukemia cell lines, respectively, as previously reported (Wang S et al., J Med Chem 47:1662-1675, 2004 and Diab S. et al. ChemMedChem 9:962-972, 2014). Compound concentrations required to inhibit 50% of cell growth (GI₅₀)

were calculated using non-linear regression analysis. The results are shown in Tables 3 and 4.

Cell Cycle Analysis and Apoptosis

Cell cycle analysis and apoptosis studies were performed as described previously (Diab S. et al. *CheMedChem* 9:962-972, 2014; Teo T., et al. *Cancer Letters*, 357(2):612-623, 2015). Briefly, human acute myeloid leukaemia MV4-11 cells (1×10^5) were seeded and incubated overnight at 37° C. and 5% CO₂. Cells were centrifuged at 300×g for 5 min upon treatment with inhibitor. Cell pellets were collected and fixed with 70% ethanol on ice for 15 min, followed by centrifugation at 300×g for 5 min. The collected pellets were incubated with staining solution (50 µg/mL PI, 0.1 mg/mL ribonuclease A, 0.05% Triton X-100) at 37° C. for an hour and analysed with Gallios flow cytometer. 1×10^5 of the remaining cells were then used in an apoptotic assay with Annexin V-FITC Apoptosis Detection Kit. The samples were analysed by FACS within one hour of staining. Data were analysed using Kaluza v1.2.

In an example shown in FIG. 1, MV4-11 cells were treated with compound 60 for 24 hat the concentrations shown. It was found that compound 60 arrested cells in the G1 phase of the cell-cycle in a dose-dependent manner, confirming its inhibitory activity against cellular CDK4/6. Treatment of cancer cells with compounds resulted in apop-

toxis as represented by the sum of early (annexin-V+/PI-) and late (annexin-V+/PI+) apoptosis. A representative example is shown in FIG. 2.

Example 3

Pharmacokinetics

For pharmacokinetic measurements, healthy male adult Balb/C mice (weighing 20-25 g) or Wistar Rat (weighing 250-350 g) were split into weight matched groups of 3 per group. Compound was administered IV (2 mg/kg for mice, 5 mg/kg for rats) via the tail vein or by oral gavage (20 mg/kg). Blood samples were collected from animals by jugular vein cannula (rats) or under anaesthesia by cardiac puncture (mice) at time zero and at intervals up to 24 h. Harvested blood was centrifuged at 7000×G for 2 minutes, and the plasma aspirated and frozen at -20° C. until analysis. Quantitative analysis of compound in plasma was carried out using LC-MS/MS methods. Pharmacokinetic data derived using Phoenix WinNonlin 6.4® non-compartmental analysis. Oral bioavailability (% F) was calculated by taking the ratio of dose-normalised AUC values from oral versus parenteral (IV) dosing. Pharmacokinetic profiles of example compounds are shown in Table 5.
